As for the animal kingdom, the primitive fauna has been thoroughly modified by man. The larger mammals are almost extinct. Bears are found very rarely in both the Alps and the Apennines, where they still live in a very small protected area. Wolves are still common in the peninsula but are no longer found either in the Alps or in Sicily. Wild stags and deer survive in Sardinia; chamois are still spread in the Alps. The large birds of prey are also disappearing; among the birds characteristic of Italy, ravens and swallows may be mentioned. In the peninsula and in the islands, countless lizards are found.

All the domestic animals have been present since the most remote times. Cattle and pigs are prevalent in continental Italy, whereas sheep prevail in southern Italy and in the islands, where pastures are poorer. In the same southern regions, there are also many donkeys and mules. Buffaloes were imported from Asia, and some semiwild herds of these mammals still survive in the coastal plains of southern Italy.

ROBERTO ALMAGIÀ,
Professor of Geography, University of Rome.

2. THE PEOPLE. The Land and Its Earliest Inhabitants.—Italy, in its present geographical structure, is of comparatively recent origin. The Alps and the Apennines, which form its skeleton, had already emerged from the Pliocene sea in the Tertiary period, together with the

greater part of the continent of Europe, but the Po Valley and the plains to the east and west of the Apennine chain date from the Quaternary or, to be more exact, Lower Pleistocene period. This fact explains the scarcity of primitive peoples in Italy and the small quantity of Paleolithic (Old Stone Age) relics left behind them. Flint objects of the Pleistocene period, made in the Mousterian style, have been found, and from bones discovered in Rome and Latium between 1929 and 1939, we know that they were produced by a type of man living in the Riss-Würm interglacial stage about 50,000 years ago. This was Neanderthal man, thinly but widely distributed over many parts of Europe. His distinguishing marks were a long, narrow (dolichocephalic) skull, a low-swung face, a prominent occiput, a sloping forehead with a thick, bony visor just above the eyes, a wide nose, a receding chin, a strong, stocky body, and skin that may have been dark in color. He had a spoken language, made arms and tools, used fire both for heat and for cooking, and knew how to protect himself with what means he had against the cold and the wild animals around him. Later, other anthropological types made their appearance in Italy, including the Grimaldi who lived in Liguria, only to disappear, leaving no traces behind them. See also section on *History*; MAN, PREHISTORIC RACES OF; STONE AGE.

Pre-Roman and Latin Peoples.—The history of the human race in the second millennium before Christ is complex and for the most part little known. In northern Italy, peoples of pre-Indo-European stock, among whom we may single out the Ligurians, developed a Neolithic (New Stone Age) civilization. They buried their dead. Elsewhere in Italy, ancient groups of Sardinians, Corsicans, and Elymi, whose linguistic classification is still uncertain, were superseded by the first wave of Indo-European-speaking peoples, who eventually made up the Latinian and Sabelian branches of the Italic subfamily. In the north, around 2000 B.C., the first metals (copper, and then bronze) appeared, incineration was introduced, and dwellings were built on piles north of the Po, and, later, fortified villages of pile dwellings laid out in a geometrical plan on the dry land south of the river. This was the civilization known as terramara, related to the later (9th to 6th century B.C.) Villanova civilization which spread gradually over the central and southern parts of Italy. The Villanova civilization arose as a second wave of Indo-European-speaking peoples entered Italy, and from it came the third branch of the Italic subfamily, the Osco-Umbrian.

In the course of their expansion, these peoples discovered iron. From their contacts with the predecessors of the Etruscans, or, as some scholars think, with the Etruscans (who had migrated from Asia Minor between the 10th and 8th centuries B.C.), there arose along the northern part of the Tyrrhenian coast what we know as the Etruscan civilization.

This period marks the end of Italian pre-history. Peoples of Illyrian origin, Iapyges in the south and Veneti in the north, settled on the shores of the Adriatic, while Greeks colonized and civilized the coastal zones of the far south (Magna Graecia) and Sicily. Waves of barbarian invaders of Celtic stock, whom the Romans called Gauls, descended on northern Italy. They drove the older inhabitants toward the south and even ventured as far as the young city of Rome,

from which they were driven back at the end of the 4th century B.C. It is impossible to determine what portion of the Ligurian, Etruscan, and Italic peoples stayed on in the northern plains after the Celtic invasions. There are, however, signs of a thorough anthropological mixture, particularly in the plains south of the Po.

The Romans were endowed with military prowess and with an incomparable talent for spreading civilization, and were thus able to carry out the task of unifying this heterogeneous aggregation of peoples, first imposing their political rule, and then their laws, culture, language, and thought. In the time of Augustus (r. 27 B.C.—4 A.D.), Italy was completely Romanized, although its regional division showed recognition of its varied origins. The unity created by the Romans did not give way before the barbarian invasions of the 5th and 6th centuries A.D., in which peoples of Germanic, Slavic, and even Mongol origin took part. It continued to develop until *latinitas* (Latinity) finally became the distinguishing characteristic of the Italian people. See also section on *History*.

Language and Dialects.—The language introduced into the provinces of the Roman Empire by Roman soldiers and civil authorities was not literary Latin but a popular speech which took root everywhere, absorbing local forms and customs, and evolving in different ways. Numerous Latin dialects developed, but the people who spoke them had to use a simplified and provincial form of standard Latin in official documents and in their communications with Rome and other parts of the empire. The passage of centuries brought with it the outgrowth from the various kinds of regional speech of the primitive Italian dialects, which are the prototypes of the dialects still spoken in modern Italy.

The replacement of local dialects by a standard literary language was a particularly slow process in Italy, because educated people were for a long time reluctant to give up Latin, which was still used in public papers and in the liturgy of the Roman Catholic Church. But the flowering at the beginning of the 12th century of Provençal poetry, whose widespread imitation stimulated literary exchanges among the various regions, led in the early 13th century to the predominance of the Tuscan dialect, generally considered the nearest to classical Latin. The position of Tuscan was strengthened by the tremendous influence of Dante Alighieri (1265–1321), followed by Petrarch (Francesco Petrarca, 1304–1374) and Giovanni Boccaccio (1313–1375). In this way, the Italian language came into being, and in the succeeding centuries other distinguished writers increased its importance as one of the world's great languages.

The general effect of linguistic unification was to reduce the number of differences among the various dialects. There are still fairly marked variations of vocabulary, accent, and pronunciation, but Italians of the upper and middle classes write and usually speak a standard language, which public education, the newspapers, the radio, motion pictures, and the development of communications and travel have brought into general use.

The linguistic unity of persons of Italian origin (among whom we must count the inhabitants of the Swiss canton of Ticino, of the cities of the Dalmatian coast of Yugoslavia, and of the island of Corsica) is shown by the very

small number of Italian citizens who habitually use other languages or dialects (Slav, German, French, Albanian, Greek, Catalan). The majority of these foreign-language citizens live along the northern border. According to the 1921 census, there were 801,923 of them, or about 2.1 per cent of the general population, and about 45 per cent lived in the northeastern territories awarded to Italy after World War I and transferred in 1947 to Yugoslavia and the Free Territory of Trieste. The census of 1936 registered 109,000 persons of foreign nationality living on Italian soil. (See also sections on *Language* and *Literature*.)

Anthropology.—When we speak of the racial make-up of the Italian people, we do not refer to the three major groups (white, Mongoloid, and Negroid), since, with the exception of a few thousand Mongols who took part in the invasions of Attila (452 A.D.) and other barbarian leaders, the ancestors of the modern Italians were all of the white group. Rather, we refer to the various branches or subdivisions of the white group to which they belong.

The groups which over the centuries came to form the Italian people were themselves, to a certain extent, of varied origin, and some of these groups intermarried with other peoples. This explains the difficulties encountered by anthropologists in their attempts to classify the few skeletons which have come down from prehistoric times. It is important to note, however, that after the unification of the Roman Empire and the end of the period of the barbarian invasions there were no mass movements of population. The sporadic immigration of Germans, Normans, Arabs, Slavs, Catalonians, and Albanians had little influence on the make-up of the Italian people, and in any case their presence is recorded in history and we can take it into due account. Aside from the large cities, we may say that the anthropological composition of modern Italy is not very different from what it was in the time of Augustus. This simplifies many genealogical problems and permits us to concentrate on contemporary racial composition and distribution, which in turn shed light on the problems of the past.

In order to get our bearings, let us look at Table 1. In the first column are listed the regions of Italy prior to World War II; in the second, the average heights, in centimeters, of 20-year-old males from these regions who were born in 1908; in the third, the average head measurements (corrected), expressed in terms of the cephalic index (for definition, see ANTHROPOLOGY), of 20-year-old soldiers born between 1859 and 1863. The remaining columns give the frequency per 1,000 among these same soldiers of blond hair, blue eyes, and a fair complexion.

The greatest heights are found in Venezia Giulia (most of which is no longer part of Italy) and Veneto—168.28 centimeters (5 feet 6¼ inches) and 167.14 centimeters (5 feet 5¾ inches), respectively—and as we proceed west and south, the heights become progressively smaller. Throughout the north, however, they remain over an average of 166 centimeters (5 feet 5½ inches). In the heart of central Italy, the average is 163 centimeters (5 feet 4 inches); it decreases steadily thereafter, reaching its lowest point in the south and the islands. The absolute minimum, found in Sardinia, is 160.89 centimeters (5 feet 3⅓ inches). With regard to stature, therefore, we may divide Italy into three

areas—the northeast, where the men are fairly tall; the northwest and center, where they are of medium height; and the south and the islands, where they are short.

Glancing again at Table 1, we find high cephalic indexes (indicative of brachycephalic, or short, wide heads) in the Veneto region and in Venezia Giulia. The very highest figure, however, occurs in Piedmont (84.9), in the extreme northwest, where heads are nearest to a round shape. Lower averages are found in Emilia, Lombardy, and possibly in Venezia Tridentina, and still lower ones in Tuscany, Marche, and Umbria. If we consider as fairly roundheaded all measurements over 82½, then we may say that all of northern Italy (except Liguria) and the northern part of central Italy are definitely brachycephalic. Farther south, dolichocephalism (long-headedness) prevails increasingly. Sardinia again shows the lowest figure (76.5).

The data on pigmentation, in the last three columns of Table 1, follows that of head measurements, with high figures in Piedmont and Lombardy and low ones in Sardinia. In summary, we may say that in the brachycephalic regions there are fairly numerous examples of light hair, eyes, and complexion, but in the dolichocephalic regions these traits are rare and the population must be considered definitely dark in coloring.

Table 1—BASIC ANTHROPOLOGICAL TRAITS

¹ Pre-World War II regional division.

² Based on corrected measurements of 20-year-old males, born 1908.

³ Based on data on 20-year-old soldiers, born 1859–63.

Referring again to history, we may note the following allied facts:

(1) The northwest regions correspond in a general way to the territory invaded by the Celts, who dispossessed the former Ligurian, Etruscan, and Italic inhabitants. Indeed, the Romans called this region Cisalpine Gaul. Here we have found medium heights, brachycephalic heads, and predominantly dark coloring, with, however, a sizable number of blonds.

¹ Some authorities class all measurements between 80.1 and 83 as subbrachycephalic.

(2) The regions of Veneto and Venezia Giulia were invaded by the Illyrians, and Augustus called by the name of Venetia the whole northeastern section of Italy bordering on Illyrium. In this area are the greatest average heights in Italy, combined with brachycephalism and a high frequency of light coloring.

(3) Many of the central and southern regions bear the names of ethnic groups belonging to the great Italic-speaking subfamily which formerly occupied them, and some recall the era of Greek colonization. South of the 43d parallel (which runs about 70 miles north of Rome) begins the area of short stature, increasing dolichocephalism, and darker coloring.

(4) The middle ground between the 43d and 45th parallels includes Liguria and Tuscany on the west, which have medium heights and fairly small head measurements, and the regions of Emilia (where the terramara peoples lived), Marche, and Umbria, where there were frequent and sometimes violent contacts between the old Italic and Etruscan inhabitants and the later Celtic and Illyrian invaders.

Before passing from these notes to a fuller interpretation of the anthropological data at hand, we must take into consideration a number of points. First, other traits should be weighed. Of particular importance are the height of the cranium, the relative width of the nose, and the relationship between the length of the torso and that of the legs. In addition, we should eliminate from the averages given in Table 1 the influence of heterogeneous urban populations. Besides the averages, we should take into account the distribution of anthropological traits and the relationships among them. Moreover, we should consider the various ways in which hereditary traits are transmitted, and we must not forget the influence of geographical, social, and nutritional factors. Research has been done along these lines, but we must confine ourselves to remarking that all these points have their place in our discussion.

The average physical traits of the Piedmontese, and to a lesser degree of the Lombards and Tridentines, correspond to those usually attributed to peoples of Celtic stock. Actually the word Celtic is more properly applied in the field of linguistics, and the traits in question are not shared by all peoples of Celtic stock, nor are they the exclusive property of this stock. The modern term Alpine is preferable, describing as it does an abstract anthropological group of medium height and stocky physique, roundheaded and with prevalently dark coloring. The ways in which the traits of the Alpine people of Italy are transmitted by heredity, however, make us suspect numerous mixtures and amalgamations with people of very different physical characteristics, and the frequency in its most representative elements of numerous subjects of light coloring goes far to confirm this suspicion.

These Alpine peoples are bordered on the east by the Venetian and Julian Venetian descendants of ancient Illyrian invaders. Their fairly tall stature and brachycephalism, combined with dark coloring and other traits, roughly correspond to those of the so-called Dinaric type, which is found in all the Venetian regions as well as along the coast of Yugoslavia. This type, too, is racially mixed, for the cranial and pigmentary data is almost certainly hybrid, and the frequency of blonds is another index of irregularity. There is more consistency in the matter of height, a factor

of great anthropological importance among these Adriatic peoples.

Let us look now at the south of Italy and the islands. Here the population is descended from many overlapping stocks—pre-Italic, Phoenician, Greek, and Italic. Under anthropological analysis, however, it is shown to be remarkably homogeneous, though not to such an extent, for example, as the Scandinavian population. For this reason, its most conspicuous traits—low stature, a long, narrow head, and dark complexion—are said to characterize a human type called Mediterranean. This type is widespread along the coasts of the Mediterranean Sea; it is most concentrated and uniform in Sardinia.

Are we to consider the modern Ligurians, with their head measurements approaching dolichocephalism, as representatives of the Mediterranean type? And the Tuscan descendants of the Etruscans, with measurements only slightly larger? We cannot exclude this possibility, although there is other contradictory data, based on the fact that Tuscany is part of the middle ground of central Italy, where there was such a great mixture of ethnic stocks. This mixture was especially pronounced in Emilia.

In conclusion, three of the major European racial types, in a more or less pure form, all of them with dark coloring, go to make up the population of Italy: the Alpine, the Dinaric, and the Mediterranean. There are, on the other hand, very few examples of the Nordic or East Baltic types.

Demography.—Growth of Population.—There is quite a difference between the few hundred men of the prehistoric era and the 1948 Italian population of 46,403,000. This population was not built up by immigration except during the pre-Roman and Roman periods and the 5th and 6th century barbarian invasions. Since then its growth has been due entirely to the predominance of births over deaths, and emigration has not altered the favorable balance. Since this growth has taken place over a period of 4,000 years, the average annual rate of increase has been slow: about 1 per 1,000. (Table 2 shows the population of Italy from the death of Augustus to 1948, with a forecast for the year 2050.)

Table 2—POPULATION OF ITALY

Year	No. Inhabitants
4 ¹	6,500,000

2050 ³	56,800,000

¹ Estimate. ² Census. ³ Forecast.

Note: All figures are for area within political boundaries at the respective dates, and are not therefore entirely comparable.

According to calculations made by historians, the rate of increase was even lower in the period from the beginning of the Christian era to 1500, amounting to only about .4 per 1,000. After this time, however, under the influence of favorable European conditions and the Industrial Revolution, the population increased at a much faster rate, particularly during the 20th century. The maximum of 10.6 per 1,000 was reached in 1936–1941, after which the rate declined. If prophecies

based on complex mathematical calculations are correct, there will be a decrease to less than 2 per 1,000 by the year 2050.

The density of population in 1948 was approximately 399 persons per square mile. It is true that other European countries—for example, Belgium, the Netherlands, and the United Kingdom—are more densely populated, but the Italian population problem is a serious one because of the mountainous nature of the terrain, the lack of mineral resources, and the poor condition of much of the soil, brought about by 3,000 years of unscientific agricultural practices.

Trades and Professions.—Occupational classifications may be made in various ways, two of which deserve mention here. The first and simpler way is to list all persons no longer infants according to their gainful activity. The Italian census of 1936 registered 33,728,406 persons over 10 years of age, of whom 18,345,432 exercised a trade or profession. Table 3 shows the division

Table 3—POPULATION OVER 10 YEARS OF AGE ENGAGED IN TRADES AND PROFESSIONS CENSUS OF 1936

Trades and professions	Number engaged		Number engaged per 1,000	
	Total	Males only	Total	Males only
Agriculture	8,756,064	6,328,531	477.3	483.1
Hunting and fishing	86,721	83,181	4.7	6.4
Industry and handicrafts	5,375,152	3,997,779	293.0	305.2
Transportation and communications	702,201	667,049	38.3	50.9
Commerce	1,504,820	1,068,285	82.0	81.6
Banking and insurance	100,543	88,242	5.5	6.7
Arts and letters	142,958	108,893	7.8	8.3
Public administration	808,866	575,938	44.1	44.0
Private administration	81,059	29,693	4.4	2.3
Religion	126,323	74,938	6.9	5.7
Domestic service	660,725	75,901	36.0	5.8
Total	18,345,432	13,098,430	1,000.0	1,000.0

according to occupation of persons registered by the census. We note that 8,756,064 persons, or approximately 47.7 per cent of the total employed population, were engaged in agriculture.

The second method disregards age and divides the entire population into families, listing the trade or profession of the head of each family. According to this method of calculation, there were in Italy in 1936, 3,628,000 families whose head worked in agriculture (38 per cent of the total), and these families included 18,385,855 persons, or 42.8 per cent of the total population. This fact has particular social significance, because it shows that the members of many agricultural families have left the land and taken up other occupations.

All the major trades and professions except agriculture are concentrated in the large cities, and because of the enormous increase of industrial and commercial activity since the late 19th century, there has been a correspondingly heavy increase in the population of urban centers. In 1946, there were 70 cities with more than 50,000 inhabitants and a total population of approximately 12,400,000, or 27.5 per cent of the total; and 26 cities with over 100,000 inhabitants and a

total population of 9,250,000, or 20.5 per cent of the total. The five cities with present populations of more than 500,000 increased as follows between 1901 and 1947: Rome, 462,783 to 1,573,994; Milan, 491,460 to 1,267,550; Naples, 563,540 to 977,946; Turin, 335,656 to 712,983; and Genoa, 234,710 to 649,367.

Religion.—The question asked by census takers in Italy concerning religion has, in recent years, been interpreted as having an official meaning. That is, it aims at establishing in which religion a person was born or reared rather than at ascertaining what his actual beliefs and church attendance are. This, then, is how we must interpret the figures of the 1931 census, which show that 99.6 per cent of those registered were Roman Catholics, .34 per cent belonged to other faiths, and only .06 per cent declared that they had no religion or were unwilling to make any statement. The small minority of 139,719 persons belonging to other than the Roman Catholic Church included 83,618 Protestants, 33,381 of whom were foreigners, and 47,825 Jews, of whom 8,713 were foreigners.

Vital Statistics.—The rapid increase in the Italian population in the 20th century, as shown in Table 2, is due to the fact that many more persons have been born than have either died or emigrated. The number of births hovers around 1,000,000 per year, while the number of deaths is about 500,000. (Birth, death, marriage, and emigration rates are given in Table 4.) As in

Table 4—MARRIAGE, BIRTH, DEATH, AND EMIGRATION RATES (per 1,000 inhabitants)

Year	Marriages	Births	Deaths	Emigrants
1881-1885	8.1	38.0	27.3	5.36
1901-1905	7.4	32.7	22.0	16.82
1911-1915	7.4	31.5	19.1	15.46
1921-1925	8.4	29.5	17.3	7.87
1931-1935	6.8	23.8	14.1	2.19
1936-1940	7.6	23.2	13.8	1.11
1941	6.1	20.9	13.9	0.19
1942	6.4	20.5	14.3	0.18
1943	4.9	19.9	15.2	...
1944	5.0	19.2	15.9	...
1945	6.8	18.3	13.8	...
1946	7.6	22.8	12.3	1.17
1947	9.4	21.9	11.4	3.16
1948	8.3	21.5	10.6	2.93

most civilized countries, the birth rate has declined in Italy in the 20th century independently of the number of marriages. In 1948, the birth rate (21.5 per 1,000) was only about 56 per cent of what it had been in 1881-1885 (38.0 per 1,000). In the same period, the death rate declined from 27.3 to 10.6 per 1,000.

The decline of the death rate is an important sign of civic progress in culture, public health, and material welfare. Evidence of this progress is shown in detailed fashion in Table 5, which compares the life spans of Italians in 1881 and 1941. From this table, we learn that whereas in 1881 only 788 of 1,000 males reached the age of 1 year, 592 reached 10 years, and 412 reached 50 years, in 1941 the corresponding figures were 908, 858, and 725, respectively. The death rate for males during the first year of life was 212.4 per 1,000 in 1881, but declined to 91.8 per 1,000 by 1941, a difference of 57 per cent. The difference for persons 10 years of age was 76 per cent; for those 50 years of age, 41 per cent. The life span of the average male increased from 35.2 years in

1881 to 57.6 years in 1941, or 63 per cent. A similar though less marked increase took place in this period for all age groups up to 70.

Other signs of improved social conditions, and particularly of public health, are seen in the data concerning causes of death. Fig. 1 shows that from 1907 to 1939, except for the years of World War I, there were progressively fewer deaths from diseases of the heart, tuberculosis, and infectious diseases in general. There was a setback

the destruction during the war of many reclamation projects and the movement of thousands of refugees. In general, however, there were no such epidemics as had occurred during World War I (cholera in the army, and influenza), and the few outbreaks of contagious diseases (smallpox, typhus) were quickly put down by an efficient public health organization, which provides the services of a doctor, midwife, and pharmacist in even the smallest villages.

Emigration.—Because of the density of the population and the poverty of the country, in past decades many Italians went abroad to make their livings. We note from Table 4 that during the first 15 years of the 20th century approximately 16 out of every 1,000 inhabitants emigrated each year. Some of the emigrants returned to Italy, but not in proportions to equal the number of those who left. During the period of heaviest emigration about 250,000 persons, mostly men and many of them skilled northern workers, went each year to other parts of Europe, while an additional 400,000, mostly peasants and day laborers from the south, went to the United States and South America. During World War I, the emigration rate was reduced to one seventh of its former level, but by 1920 substantial emigration had resumed. Later, restrictions on immigration imposed by various countries (such as the United States Immigration Act of 1924), and the economic and military policy of the Fascist government reduced emigration to negligible proportions. Among the policies of the new democratic postwar government has been the encouragement of emigration on a substantial scale, particularly to France and Argentina. Net emigration in 1946 amounted to about 53,000 persons; in 1947, to about 144,000; and in 1948 to about 136,000.

Many of those who emigrated at the beginning of the 20th century made their homes abroad and became citizens of their adopted countries. The United States census of 1940, for example, listed 1,561,100 persons of Italian birth. Italy has benefited from the emigration of the past, which relieved overpopulation and unemployment, and emigrant remittances helped to cover international financial commitments. Particular benefit accrued to the south, which centuries of bad government, poor soil, and difficulties in establishing modern industry had made into the least progressive part

Fig. 1. Death rates from selected causes per 100,000 population in Italy, 1907 to 1942.

in 1941–1942, especially in the case of tuberculosis, as a result of World War II, during which the national income was reduced to 60 per cent of the prewar figure, and nutrition, which was based on carbohydrates and had lacked fats and proteins even in better times, declined to little more than 2,000 calories per day for an adult male.

In contrast to the general trend, we note an increase, dating from 1926, of deaths due to malignant tumors. This may be accounted for in part, however, by more accurate diagnoses than those made in the past.

Two characteristic diseases which had afflicted Italy for a long period seemed to have been almost entirely eliminated on the eve of World War II. These were pellagra and malaria. The first reappeared to a small extent as a result of malnutrition, and the second as a consequence of

of Italy. The countries where the emigrants went were equally benefited. The emigrant is often more enterprising and hence more valuable economically than the man who stays at home. From a sociological point of view, we may note that the emigrant's ability to do hard work and his thrift have done much to dispel the mythical foreign conception of the Italian as lazy and pleasure loving, absorbed in *dolce far niente* (sweet idleness).

Culture.—Elementary schooling is free and compulsory in Italy. There were in 1946, 869,112 pupils attending the 10,599 *asili* (nursery schools or kindergartens), which had 20,552 teachers; and 4,357,137 pupils in the 35,252 public and private elementary schools, with 133,004 teachers. It was estimated that 90 per cent of the children in the age group between 6 and 14 were attending school. There were in the same year 675,732 students attending secondary schools, including art and technical schools. University students numbered 189,663.

These figures are of interest less for the present state of education than as an index of the future. If we speak of culture in the highest sense, we cannot properly measure it even from the data furnished by the 1936 census regarding the number of persons engaged in the most honored professions, shown in Table 6, for it omits

Table 6—PERSONS ENGAGED IN CULTURAL OR PROFESSIONAL ACTIVITIES, CENSUS OF 1936

Classification	Number engaged	Number per 100,000 population
Heads and teachers of secondary schools and colleges.....	188,736	439.7
Roman Catholic priests and ministers of other sects.....	150,234	350.0
Physicians and pharmacists.....	40,095	93.4
Lawyers, notaries, etc.....	35,567	82.9
Prefects and other public and private officials.....	24,442	56.9

Painters, sculptors, and musicians.....	15,393	35.9
Chemists, physicists, and naturalists.....	5,425	12.6
Writers and editors.....	1,236	2.9
Diplomats.....	936	2.1
Total.....	484,349	1,128.3

many persons with university degrees, both publicly and privately employed. Only a relatively small number of the persons listed in the table make a direct contribution to Italian culture, but it is largely among the professional groups that we must look for those who before World War II produced the 25,000 books and 4,000 periodicals printed each year by Italian publishers, and the 1,000,000 readers at the public libraries, who borrowed more than 2,500,000 volumes. Here, too, we shall find those who visit art galleries, attend concerts and lectures, and support intellectual, artistic, and scientific development.

Way of Life.—There are great differences of outlook, customs, and living conditions among the Italian peasants, who make up the largest part of the population. There is the mountain dweller, who must break rocks in order to plant a small field; the prosperous farmer of the irrigated valleys of Lombardy; the tenant farmer who receives only a modest income in money or produce; his richer counterpart in Tuscany and Emilia; the shepherd of Abruzzi, the Maremma section, and Sardinia, who shares the solitary and nomadic life of his flocks.

Beside this varied rural way of life, there is another, thousand-year-old urban civilization. We must remember that as late as 1860 Italy was still divided into seven small, independent units, some of which had two capitals. There were, then, seven separate courts, each with its own ceremonies, nobility, clergy, bankers, and hangers-on of every kind, in addition to other, even more numerous, cultural and economic centers, some of which were the former capitals of vanished republics and principalities. This explains the wealth of monuments, art collections, archives, and historical libraries found throughout Italy, and the great number of bishoprics (282), universities and other institutions of higher learning (about 40), academies, and educational centers.

Apart from its position as the center of the Roman Catholic Church, Rome has none of the metropolitan character of Paris, London, and New York. Milan, Turin, and Genoa are greater industrial centers, as are many smaller cities and their suburbs. There are few great factories for the mass production of uniform goods; in fact, even such machine-made products as automobiles and watches are often turned out by skilled artisans whose talent and ingenuity make up for the lack of technical organization. The industrial census of 1937-1939 listed 217,893 manufacturing plants, of which only 87 employed more than 2,000 workers, and 804,646 handicraft industries, of which 786,000 employed fewer than 5 workers. Italian industry and handicrafts are known for the excellence and refinement of their production. Celebrated the world over for their quality are Florentine jewelry, Venetian lace and embroidery, Murano (Venetian) glass, leatherwork and gloves, faience ware, the wooden statuary of the Italian Alps, the marble sculpture of Florence, and the corals of the coastal towns near Naples.

The cities, laden with memories and monuments of antiquity, and still holding out against the encroachment of heavy industry, are perhaps the most obvious demonstration of the Italian's strong attachment to tradition. Another aspect of this attachment is the retention of some very old legal and social institutions, such as the rural *mezzadria*, a medieval form of arrangement between landowners and their tenants whereby the former are paid by receiving exactly half the produce of their land.

The Protestant Reformation hardly touched Italy, and nearly the entire population belongs, at least in a formal sense, to the Roman Catholic Church. Religious faith is usually deep and sincere despite occasional manifestations of outworn custom and superstition. Religious beliefs, whether or not they are accompanied by church attendance, have a solidifying influence on family life. Divorce is prohibited. The infrequency of homicide (15 cases per 1,000,000 inhabitants in 1939), suicide (69 per 1,000,000), and death from chronic or acute alcoholism (10 per 1,000,000) bear witness to self-discipline and moral balance.

In a few districts the capital invested in industry or the natural fertility of the soil have produced good living conditions. On the whole, however, the poorer classes suffer much economic hardship.

The Italian character varies considerably from one part of the country to another. The Italian of the northwest is cold and reserved, accustomed by business dealings to concentration and prudence. The central Italian, particularly the Tus-

can and the Umbrian, has a more open nature, and the southerner is highly imaginative and very much of an extrovert, witty and exuberant in words and gestures. It would be an error, however, to conclude that the southerner is a superficial wastrel. The people of the Naples area, for example, have to their credit the accomplishment of having turned a wasteland into a garden, bringing all the water from underground, and succeeding with great effort in raising five or six crops of fruit and vegetables a year.

There are many ancient holiday celebrations in Italy. These create local rivalry or bring the people together in a community effort which usually ends with banquets of regional food and wine. Among the more famous of these celebrations are the *Palio delle Contrade*, municipal races between the wards of Siena, held in July and August; the regattas of Venice; the *scoppio del carro*, a religious procession which takes place at Easter in Florence; the October wine festivals in the country around Rome; the Piedigrotta festival of Naples, with its song competitions (see section on *Music*); and the *ceri* (candlelight celebrations) of Catania. The night festivities of the Feast of the Redeemer (third Sunday in July) in Venice are particularly beautiful because of their illumination. The entire city is decked out with Japanese lanterns, and fireworks are mirrored in the lagoon. Good Friday is observed in Umbria and other places with a ghostly torchlight procession following an image of Christ's body.

To these popular celebrations must be added the biennial art exposition and the periodic motion-picture festival of Venice, the *Maggio musicale* of Florence, and the art competitions held every four years in Rome. In addition, sports are popular, and large crowds turn out for soccer and boxing matches and for automobile and bicycle races.

World War II changed many habits and had its effect on the spirit of the Italian people. Against the old individualistic and conservative background we see new currents and aspirations toward a more democratic form of government. Old Italy, which has often been called "the country with a thousand lives" may emerge from the troubled postwar period with a new aspect whose exact form we cannot as yet imagine, but whose success should be forwarded by a past history rich in experience and glories.

Italian Contributions to Modern Civilization.—The time is past when one could look at the history of one's native land with the same narrow pride which leads a father to consider his own child superior to all other children. The modern temper is practical and cosmopolitan, and its evaluations are made on an objective basis, taking into consideration only the fundamental contributions made by the various peoples of the world to present day civilization.

If we study Italy's more than 2,500 years of recorded history, we shall find a very large number of these contributions. We see first the spread of Roman civilization among the barbarians, which left behind it permanent traces. The Latin language was the vehicle of its transmission, and its chief expression was in the field of law, where it created the legal conceptions of private property and the family, and in a westernized form of Greek art and philosophy.

When the Roman Empire finally crumbled

away, Italy again assumed leadership through the Roman Catholic Church, which extended to all men the religious and social principles of the Gospel, by means of a common liturgy and by its juridical and political structure. For several centuries, European culture was entirely a product of Catholicism, with St. Thomas Aquinas (1225?–1274) and Dante as its most representative figures.

Meanwhile, the geographical boundaries of the world were steadily enlarging. In the international rivalry for new routes and the discovery of new lands, a number of Italians, among them Christopher Columbus (1446?–1506) and Amerigo Vespucci (1451–1512), played a major role. As the known world grew larger, men strove to widen their intellectual horizons. This was the aim of humanism, which arose among a small group of Italian scholars, anxious to recover the classical values of Greek and Roman culture, and subsequently spread all over Europe. This movement had leaders in every country of western Europe, so that beside the Italian Count Giovanni Pico della Mirandola (1463–1494) we find the Dutch Desiderius Erasmus and the English Sir Thomas More. Humanist ideals were not confined to a small circle; rather, with the assistance of Renaissance art, as exemplified in such figures as Leonardo da Vinci (1452–1519), Michelangelo Buonarroti (1475–1564), Titian (Tiziano Vecelli or Vecellio, c.1480–1576), and Raphael (Raffaello Santi or Sanzio, 1483–1520), they penetrated every social level and left an abiding influence behind them.

Out of the Renaissance came the 17th century scientific development. No name is greater here than that of Galileo Galilei (1564–1642), who discovered planetary orbits, founded modern mechanics, and gallantly defended the Copernican system. Other great Italian scientists were Santorinus (Santorio Santorio, 1561–1636), a professor of medicine who devised an apparatus for measuring the pulse and a clinical thermometer; Bonaventura Cavalieri (1598?–1647), mathematician who originated the method of indivisibles; Evangelista Torricelli (1608–1647), inventor of the barometer; Marcello Malpighi (1628–1694), founder of microscopic anatomy; and Giovanni Battista Morgagni (1682–1771), founder of pathological anatomy.

It has often been said that Italian culture declined after the 17th century. There is some truth in this statement, if we mean the relative decline brought about by the increase of intellectual effort the world over, and hence a lesser tendency toward monopoly of intellectual achievement on the part of a single nation. It is also true that since the mid-19th century a large portion of scholarly work has depended on collective study and modern apparatus, and so is more easily developed in wealthier countries than Italy. Nevertheless, Italians have made many and outstanding contributions to modern civilization. Italian writers scaled new intellectual heights with the profound philosophy of Benedetto Croce (1866–) and the literary relativism of Luigi Pirandello (1867–1936). Their accomplishments are matched in the field of science by the pioneer work in electricity of Luigi or Aloisio Galvani (1737–1798) and Count Alessandro Volta (1745–1827), inventor of the voltaic pile; by the application of electricity to power production of Antonio Pacinotti (1841–1912), inventor of the dynamo with ring winding.

3. HISTORY. The history of Italy extends over more than 2,500 years in an unbroken series of events. It is this continuity which is responsible for the development of one of the most clearly defined of nations. This is true despite the fact that people of diverse origins, belonging to different states, played prominent roles in that history. The Italian nation is thus very old—the oldest in Europe after Greece. As a modern state, however, it is very young, dating only from 1861. The Italian people appear, therefore, both new and ancient.

The complexity of Italian history and the slow development of the Italian nation are due not only to geographical diversity and the presence of a number of ethnic elements, but also to political and social trends. Perhaps no other European country has lived through so many events, been subjected to so much external pressure, suffered so many invasions. In no other country has the ecclesiastical element, ever since the early Middle Ages, assumed such dimensions and become so much a part of civil life. In no other land since antiquity do we find such disparity between cultural background and historical traditions on the one hand, and political efficiency and national independence on the other. The first element ranked high in Italy, sometimes very high, while the second was usually low or nonexistent.

Archaeology and Prehistory.—Traces of the Lower and Middle Paleolithic periods have been found in most parts of Italy except Sicily and Sardinia. The Upper Paleolithic period is represented in the northern, central, and southern parts of the peninsula, and in the islands as well. To this period belong the Grimaldi, Cro-Magnon, and Maiella types of man. The succeeding Neolithic period left evidence of great progress in both the peninsula and the islands. With it came the pastoral arts and the use of pottery. According to some authorities, pottery was introduced into Italy by foreign invaders; according to others, it resulted from local evolution, possibly as a consequence of foreign influence.

We also find a variety of peoples in this period. Among the ancient Italian peoples of whom we have written evidence, the Ligurians may correspond to the Mediterranean people of the Neolithic period. They seem to have lived, in

prehistoric times, in most parts of Italy. They were akin to the Siculi who inhabited Sicily at a later date. Soon, besides polished stone, copper utensils make their appearance, and we reach the Aeneolithic period, or Age of Copper. In addition to artifacts in stone, copper, and bone, this period produced painted pottery of definite artistic merit. Religious practices are further developed; the inhabitants of the peninsula foster trade and begin mining. The decorative arts make progress, and the plastic arts are introduced. Most archaeologists believe that the ethnic groups of the Neolithic period were still present. The well-known Italian historian Gaetano De Sanctis, on the other hand, assigns the beginning of the Aeneolithic period to the influx of an Indo-European-speaking people, the Italici. (See also *ARCHAEOLOGY*; *MAN, PREHISTORIC RACES OF*; *NEOLITHIC PERIOD*; *PALEOLITHIC PERIOD*; *STONE AGE*.)

During the Aeneolithic period, pile-built lake dwellings called palafitte appeared in northern Italy. They continued to be used through the Bronze Age, though in this period the analogous terramare (pile dwellings found in mounds of marl on swampy land) gained in importance. Although they are derived from the palafitte, they show far greater development and are found grouped in size and numbers which indicate embryonic cities. (See also *BRONZE AGE*; *LAKE DWELLINGS*.)

Palafitte and terramare dwellers practiced agriculture and molded new types of pottery. The terramare people cremated their dead instead of burying them as had the previous inhabitants. Both groups are generally identified with the Italici, but De Sanctis believes them Etruscans.

The Iron Age is represented in Italy by various groups of remains. Those of the Villanova civilization (named for a locality near Bologna where a typical burying vault was discovered) are particularly important. They are related to the Hallstatt civilization north of the Alps (see *HALLSTATT EPOCH*). Traces of the Villanova civilization are found in Emilia, Tuscany, and Umbria; they can be divided into four periods extending from around 1000 B.C. to 600 B.C., or into historic times. The Villanova people, as well as the other inhabitants of northern Italy, practiced cremation during the Iron Age; other groups south of the Piceno River buried their dead. According to general opinion, the Villanovans may have been the ancestors of the Umbrians and represented a second great invasion of Italic-speaking people from north of the Alps, but again De Sanctis dissents. He insists that the Villanovans, because of their affinity with the terramare dwellers, were Etruscans. According to the more generally accepted theory, however, the Etruscans came originally from Asia Minor and landed in small, warlike groups on the Tuscan coast between the 10th and 8th centuries B.C. They proceeded inland and gradually moved north. Greek colonization began in Sicily around the middle of the 8th century (the traditional date is 735 B.C.), displacing earlier Phoenician trading posts on the island. Other Greek colonies were established in southern Italy, which came to be called Magna Graecia (q.v.). Syracuse (modern Siracusa) in Sicily and Taranto in Apulia were the principal Greek cities. Phoenician traders reached Sardinia in the 8th century B.C., and the Phoenician colony of Carthage inherited their

trading posts on the island. In the 6th century B.C., the Carthaginians gained possession of the south coast of Sicily. See also CARTHAGE; ETRURIA; PHOENICIA.

The Greek-Etruscan Age.—By the mid-7th century B.C., the ethnic pattern had achieved a certain stability. In the northwest (present day Piedmont, Liguria, and Tuscany north of the Arno) were the Ligures; in Venetia, the Veneti, an Illyrian people. Between the two groups were the Umbrians, representatives of the Osco-Umbrian branch of the Italic-speaking peoples; they extended from north of the Po River down to the Arno. The Etruscans lived between the Arno and the Tiber. East and south of the Tiber, we find first the Sabines, who spoke a language belonging to the Sabellian branch of the Italic subfamily, and then the Latins, chief representatives of the Latinian branch. Around the Apennine region of Abruzzi were other Sabellian peoples, among whom the Samnites played a leading role. From southern Latium to the end of the peninsula lived other Osco-Umbrian and Sabellian-speaking peoples—Volsci, Aurunci, Campanians, Lucanians, and Brutii. The Iapyges (Iapygii or Iapygians), another Illyrian people, inhabited southeastern Italy. The coasts of southern Italy and Sicily were populated by Greek colonies. The Phoenicians, and later the Carthaginians, had settled on the southwest coast of Sicily, while the aboriginal Sicani and the Siculi still held the central part of the island. (See also ITALIC LANGUAGES and separate articles on the various peoples.)

The predominant civilizations in the 7th century B.C. were Greek and Etruscan. The civilization of the Siceliots and Italiotes, as the descendants of the Greek colonizers in Sicily and Magna Graecia were called, was similar to that of Greece. The basic political unit was the polis, or city-state; when larger states were organized, they were always federations of cities. The Italiote and Siceliote city-states were established after the monarchial period of Greek history and never had kings. There was a landed aristocracy which generally remained in power until the mid-6th century B.C., when it was challenged by a plutocratic nobility. Sharply divided social classes developed, and commoners fought the aristocracy for legal equality and political influence. As in Greece itself, this struggle favored the rise of tyrants. Greek art, letters, philosophy, and science flourished almost as much among the Italiotes and Siceliots as they did in the homeland. Greek civilization spread to the Etruscans and the Italic-speaking peoples, though its influence was not fundamental. Both groups, and particularly the Etruscans, assimilated external and technical elements far more readily than they did spiritual elements.

In Etruria also the city was the basis of social life. Etruscan cities were governed by kings, appointed for a stated period or for life, and assisted by aristocratic chieftains called lucumones. The cities were grouped in federations, but the bond was a very loose one. The chief of these federations was the league of 12 cities of Etruria proper.

In the case of the Italici, political grouping into cities was far less frequent than among the Etruscans. Groups of villages and rural leagues predominated. In contrast to the Etruscans, businessmen and plain dwellers, the Italici were small farmers and mountaineers.

The Etruscans achieved a great commercial, colonial, maritime, and territorial expansion in the 7th century B.C. From the Po Valley, which they had colonized intensively, they reached down to Campania. Their expansion caused disagreements with both the Greeks and the Latins. The latter united to fight them, and between the end of the 6th century and the middle of the 5th century, Etruscan supremacy declined. The Italic-speaking peoples were able to take greater advantage of this circumstance than the Greeks, who were divided among themselves. Syracuse, which already dominated Sicily and aspired to a leading position in Magna Graecia, came into conflict with the Italiotes, and its tyrant, Dionysius the Elder (r. 405–367 B.C.), formed a temporary alliance with the Lucanians against them. The Campanians, Lucanians, and Brutii were thus able to extend their territory in southern Italy at the expense of the Greeks. In the north, the Gauls descended from beyond the Alps in the 5th century, conquered the Etruscan cities in the Po Valley, and then penetrated central Italy. (See CELTIC PEOPLES; GAUL.) Toward the middle of the 4th century B.C., Rome began to predominate.

ROMAN ITALY

The Roman era of Italian history may be divided into four main periods: (1) the unification of the peninsula, ending in 272 B.C.; (2) expansion into the Mediterranean, up to the conquest of Greece (146 B.C.); (3) the century of social and political crisis and civil war ending with the Battle of Actium (31 B.C.); (4) the empire, to 476 A.D.

Unification Under Rome.—The pre-eminence of Rome was due to the continuity of a capable governing class and to a geographical position that favored commercial expansion. From obscure beginnings, the city gradually increased its power and, during the 5th century B.C., became supreme in Latium. In 390, the Gauls attacked Rome and burned the city, but they were bought off and the raid proved to be only a momentary setback. A tenacious rival was the Samnite confederation, but because of superior political organization, Rome defeated it in a series of three wars (343–341, 326–304, and 298–290 B.C.), and also overcame the Etruscans, Latins, Umbrians, Campanians, and Gauls, who had failed to unite their forces against her. The subjection of the Italic peoples was followed by the defeat of the Italiotes in the Tarentine War (281–272 B.C.), despite the aid that they received from Pyrrhus, king of Epirus. As a result all of peninsular Italy south of the Pisa-Rimini line was brought under Roman rule. (See also PYRRHUS; SAMNITES.)

Part of the conquered territory was organized into municipalities, which retained a certain amount of administrative autonomy, or made into colonies—that is, given to Roman citizens who had settled there. (Some of these Romans kept their citizenship in their new homes; others retained only private rights.) Far wider was the territory of the so-called federated states, which renounced an independent foreign policy and bound themselves to fight for Rome by furnishing military contingents.

The Roman-Italic federation paved the way for Italian national unity. To the military and political bonds were added intermarriage, commerce, and the spread of the Latin language

and Roman civilization, which in its turn had been influenced by that of Greece.

Mediterranean Expansion and Cultural Change.—The period of Italian unification was followed by a period of conquest in the Mediterranean, which began with the First Punic War (264–241 B.C.). In the course of this war, the greater part of Sicily was conquered and became, in 241, the first Roman province. Sardinia was acquired in 238, Corsica around 230, and the whole of Sicily in 211. (Meanwhile, in 222, the Gauls in northern Italy were decisively defeated, and Roman colonies were extended to the Alps. By 191, Cisalpine Gaul had become a Roman province.) By 201, the greater part of the Iberian peninsula had been conquered; it was organized into two provinces in 197. (All except the extreme northwest portion was acquired by 133 B.C.) Greece was acquired at the conclusion of the Macedonian Wars (215–206, 200–196, 171–167, 149–148 B.C.). In 146 B.C., the year in which Greece was reduced to provincial status, the Third Punic War was brought to a conclusion with the destruction of Carthage. The Mediterranean had become a Roman sea. (See also GREECE—*Ancient History and Culture*; PUNIC WARS.)

The initiative and political conduct of these wars were purely Roman; the other states and peoples merely contributed troops. Moreover, the provinces formed of the conquered territory belonged only to the Roman state. Yet the commercial and demographic expansion around the Mediterranean was an Italian as well as a Roman undertaking. The conquest of Cisalpine Gaul was accompanied by the declaration that all territory lying south of the Alps was *ager populi romani* (land of the Roman people). This was a fundamental step in the identification of geographical with political Italy. The transformation of Roman-Italian society accelerated the process of unification.

Until the period of expansion this society had consisted mainly of small farmers who lived a simple and traditional life. The neglect of agriculture during a period of continuous war and the competition of imports from the newly acquired provinces ruined the small owners of the peninsula, and their land was acquired by capitalists and war profiteers. Italian merchant fleets sailed east, competing with the Greek and Asiatic fleets. In agriculture, the transition from small to large ownership brought about the introduction of vineyards and olive groves beside the wheat fields. The economic and social transformation was accompanied by cultural changes. A Roman or Latin literature developed, influenced by Greek literature, but retaining its own character. The major writers were non-Romans from various parts of Italy. The development of Latin literature intensified the spread of Greek culture throughout Italy and helped create a new spiritual unity. Rationalism, individualism, and skepticism took hold of men's minds, undermining the strong but primitive Roman civic sense.

Social and Political Crisis and Civil War.—The agrarian problem which had developed during the period of expansion became acute toward the end of the 2d century B.C. The impoverished middle class demanded part of the public land that had been given to, or had been taken over by, the large landowners. The first effective agrarian laws were enacted. They were spon-

sored by two tribunes, the brothers Tiberius Sempronius and Gaius Sempronius Gracchus (q.v.), who served in 133 and 123–122 B.C., respectively. Both were defeated in armed strife with the nobility, but their program remained in part. Social problems were interwoven with the political claims of the Italians, who demanded Roman citizenship. The Italians of Osco-Sabellian descent broke their allegiance to Rome under the pressure of economic difficulties, organized an independent federal state, and set up a capital at Corfinium on the Pescara River. They were defeated in the Social War (90–88 B.C.), but Roman citizenship was then extended to all the Italian peoples, and later to all the inhabitants of Italy.

Nevertheless, Rome remained a city-state, not the capital of a national state. This structural defect was remedied in part by the municipalization of Italy, so that the Roman state came to consist of a network of city-states, locally autonomous but directed politically by the government in Rome.

The organization of Italy into municipalities coincided with the period of bitterest internal unrest, with rival groups fighting for power and for social and economic changes. The victorious faction would confiscate the land owned by the losers and distribute it among its own supporters, first choice being given to the soldiers. The army underwent a radical transformation. The earlier casual and unpaid assemblage of well-to-do citizens became a permanent and salaried force made up mostly of poor men, who were given grants of land upon their retirement. It was a potent instrument in the hands of leaders who had as their aim the end of the republic.

The civil wars aligned the *optimates* (the aristocratic-conservative faction) against the *populares* (the democratic-revolutionary party). The former were victorious with Lucius Cornelius Sulla against Gaius Marius and his son and namesake (88–81 B.C.); the latter, with Gaius Julius Caesar against Pompey (Gnaeus Pompeius Magnus) and his sons (49–45 B.C.). This second civil war established Caesar as dictator, at first for 10 years (46), and then for life (44). In March 44, however, he was assassinated, and a third civil war began between those responsible for his death (Decimus Junius Brutus, Marcus Junius Brutus, Gaius Longinus Cassius) and the heirs of his power and program: Mark Antony, Octavius (Caesar's adopted son), and Marcus Aemilius Lepidus, who formed a triumvirate in 43 B.C. In the following year, Mark Antony and Octavius defeated their opponents in the Battle of Philippi (q.v.), but were to fight each other in the fourth and last civil war, which ended with Octavius' victory in the Battle of Actium (q.v.), on Sept. 2, 31 B.C. This date marks the end of the republic and the beginning of the empire. Four years later, Octavius was given the title of Augustus by the Senate. See also biographies of the leading figures.

The Empire.—The advent of the empire made a national life for Italy impossible. From the city-state we pass to the universal state, governed formally by a diarchy (Senate and emperor), but substantially by an absolute monarchy. At its inception, the empire already extended from the Atlantic to the Rhine, and in Asia to the Euphrates, and included the greater part of the north coast of Africa. A provincial nobility grew in size and power beside the Italian

nobility. After some resistance on the part of the Romans and Italians, Roman citizenship was extended to many classes of provincials, and in 212 A.D., all free inhabitants, with a few exceptions, were made citizens by the Emperor Caracalla. Italy's economic prosperity, which was at its height at the time of the death of Augustus (14 A.D.), began to decline at the end of the 1st century following the economic revival of the eastern provinces and the development of Gaul and Spain.

The concentration of landed property in the hands of a restricted class of agrarian nobles was accentuated during the 2d century A.D. to the detriment of small farmers and city dwellers. Under the Antonine emperors (Antoninus Pius, r. 138-161, and Marcus Aurelius Antoninus, r. 161-180), Italy's population had already decreased. Industry and commerce declined in Italy in the 2d century, while they flourished in the provinces. Italian merchants were no longer established in the East, while a rapidly growing number of Orientals were found in the West.

The economic depression brought about a decadence of municipal government in Italy. As early as the 2d century, interference by the central government had become more frequent and extensive. Even more rapid was the elimination of the Roman-Italian element from the army. During the 3d century, the soldiers—by then almost entirely provincials or barbarians—wielded all power and made up the greater part of the civil service. This meant that Italians had lost almost all influence in government. The growing despotism of the militaristic monarchy, and the anarchy caused by the competition of the aspirants to the throne put forth by the various armies, resulted in the disappearance of city autonomy. The empire, which had attained the height of its territorial extent and power under Trajan (r. 98-117) and Hadrian (r. 117-138), was diminished by barbarian encroachments.

The temporary restoration of imperial prestige and power which took place during the reigns of Diocletian (r. 284-305) and Constantine I (r. 306-337) represented the definitive transformation of the imperial republic into an absolutistic, bureaucratic monarchy with a marked theocratic and Oriental character. Italy's distinctive personality within the empire vanished, and she became completely identified with the provinces.

The reign of Diocletian also saw the first division of the empire into eastern and western sections. Although Constantine reunited it in 330, it was again divided in 364, and after a temporary reunion (388-395 A.D.) under Theodosius I, it was permanently divided at his death into the Western Roman Empire and the Eastern Roman or Byzantine Empire with its capital at Constantinople.

In the 4th century the major part of surviving Roman vitality was found in the Catholic Church, which was granted legal status by Constantine's Edict of Milan in 313 A.D., and became the state church under Theodosius (r. 379-395). Bishops acquired great civic importance. The bishop of Rome not only claimed honorary primacy among them, but also effective supremacy in the direction of the church as the successor of St. Peter. Rome won in the religious sphere the importance which she was losing politically.

Early in the 5th century the barbarians, who had already invaded the provinces, attacked

Italy. In 402, a Visigoth army led by Alaric was defeated at Pollentia, and in 405 or 406 an army of Alani and other tribes was beaten by Flavius Stilicho at Florence. In 408, Alaric again invaded Italy and two years later sacked Rome. Attila invaded northern Italy in 452, and, in 455, Rome was again sacked, this time by the Vandals under Genseric. In that year, Valentinian III, last of the Theodosian emperors to rule in the West, died. The last two decades of the Western Roman Empire present a rapid succession of impotent emperors (nine in all) dominated by barbarian generals, while some influence was exerted in Italy by the emperor in Constantinople. Finally, in 476 A.D., the barbarian soldiers stationed in Italy, in order to obtain land grants similar to those that had been given to soldiers outside the peninsula, deposed Romulus Augustulus, last Western emperor, and placed one of their own captains, Odoacer (Odoavac or Odovakar), on the throne.

THE EARLY MIDDLE AGES

With the disintegration of the Western Roman Empire, Italy gradually reassumed a distinctive character. By 476, the empire had been reduced to approximately the territory of Italy. As a result, the terms Roman and Italian were once more identical, as they had been in the late republican period. This did not mean, however, that the Romans had been absorbed by the Italians. Rather it meant that the Italians were Romans—that is, citizens of the empire, or the republic, as it was still called. Italy was still considered part of the empire, not only by the Romans, but also by the barbarian conquerors. Odoacer and his successor Theodoric were legally, and intended to remain, vicars of the Byzantine emperor in Constantinople. The secession which took place in Gaul and Spain, and which was followed by the fusion of the Roman population and the Germanic invaders, giving birth to new nations, did not occur in Italy.

Barbarian Rule and Byzantine Reconquest.

—Odoacer was vanquished and killed (493) by Theodoric, king of the Ostrogoths, who were federated with the Eastern Roman Empire. Under both rulers, Roman civil administration remained untouched and was carried on by Romans, according to Roman law, with the participation, under Theodoric, of Gothic elements in both central and local government.

Among the Roman nobility (the large land-owning class) a pro-Byzantine tendency persisted, partly because the Ostrogoths were Arians. (See ARIANISM.) It became more marked towards the end of Theodoric's reign (526). The Romans took sides with the empire when Justinian I (r. 527-565) undertook to reconquer Italy. The Gothic War (535-555), conducted by his generals Belisarius (to 548) and Narses, brought about the destruction of the Goths and the devastation of Italy, which thereafter became a Roman province governed from Constantinople.

Because of the state of war caused by the invasion of the Lombards (q.v.) in 568, executive power was vested in the commander in chief of the imperial armies, who served as exarch, or imperial vicar, and had his seat in Ravenna. He was assisted by duces, who held the command of troops in the various districts.

By this time the last remnants of municipal government had disappeared, with the exception of a few cities such as Ravenna and Naples, and city councils had been disbanded. The Roman Senate, which had already been decimated by the Goths during the Gothic War, now disappeared. Now more than ever the bishop became the most important citizen, especially since the churches were among the largest landowners. In this period, large landownership was extremely important. As the cities declined, the courts within large estates became the centers of economic life.

The imperial reconquest tightened the bonds between Italy and Byzantium, particularly in the religious and cultural fields, spreading Byzantine art. The native element reacted by resisting Justinian's interference in ecclesiastical affairs in the Three Chapters schism (see *VIGILIUS*), and by organizing at the abbey of Monte Cassino, Benedictine monastic life, which differed widely from that of Eastern monasteries. The Benedictines gained more ground in other parts of western Europe, however, than they did in Italy.

Lombard Invasion and the Division of Italy.—The Byzantine Empire was unable to provide for the defense of Italy, which in 568 was invaded by the Lombards under Alboin. The Lombards did not succeed, despite repeated attempts, in conquering all of the peninsula. Its territorial and political organization was consequently split between a Lombard state ruled from Pavia and the Byzantine province with its capital at Ravenna. Neither state was clearly defined, and they were in turn divided into a great many fragments which were only weakly united. These conditions, and the weakness of the central power, contributed to the development of regionalism, which became characteristic of Italy into modern times.

The Lombard state was headed by a king elected by an assembly of freemen, which was identified with the army. The principle of dynastic continuity had a strong influence in the election. The assembly assisted the king in enacting laws and in making major decisions. Lombard territory was divided into duchies instead of provinces, and these in most cases were based on the administrative districts of the cities. Some border duchies, however, comprised entire provinces. The most important of these were Benevento (q.v.) and Spoleto. The duke was a state official, but he actually enjoyed considerable autonomy and in many cases the succession became hereditary. The weakness of royal power in dealing with the dukes was the principal cause of the fall of the Lombard kingdom. The duchies of Spoleto and Benevento, in particular, almost constituted independent states.

The Romans or Italians were treated at first as tribute-paying half-freemen. Their position gradually improved, however. They came closer to the Lombards, and a process of absorption began, especially after the conversion of the Arian or pagan Lombards to Catholicism. This took place in the late 7th century after a treaty based on the status quo had been negotiated between the Lombard kingdom and the Eastern Empire, in 681.

The division of Byzantine Italy favored the development of local autonomy under the direction of large landowners. The landowners headed local military organizations, which became very important. Among the chief causes of friction between the Roman-Italian people and the Byzan-

tine conquerors were the repeated religious quarrels between Rome and Constantinople, brought about by the emperor's persistent interference in ecclesiastical affairs. The Italian population took the part of the bishop of Rome, or pope, as he had come to be called.

In Rome, the pope gained in power and political influence. Assisted by a number of ecclesiastical and lay councilors, he predominated not only through ecclesiastical primacy, but also through extensive landownership and religious ascendancy as the successor of St. Peter. The devotion to St. Peter, widespread among the peoples of western Europe, was a potent factor in increasing the pope's influence and in maintaining the universal importance of Rome.

A special and singularly fortunate instance of the development of local government under the suzerainty of the empire was the case of Venice—that is, of the inhabitants of Venetia who had fled from the mainland to the lagoon during the invasions and had succeeded in exploiting the natural resources of their new home by trading in fish and salt. In 697, they substituted a doge for the earlier government by tribunes.

Temporal Power and the Carolingian Empire.—A serious conflict between the papacy and the Italians on the one hand, and the Byzantine Empire on the other, developed in the first half of the 8th century. It came about partly because of political and economic factors, but more especially because Emperor Leo III (called the Isaurian, r. 717–741) had determined to abolish the worship of images (see *ICONOCLAST*). There was a general rebellion in central Italy, and the Lombard king, Liutprand (r. 712–744), intervened with the intention of eliminating the empire and extending Lombard dominion in Italy. In 728, he captured Ravenna, and later defeated the dukes of Benevento and Spoleto. Pope Gregory II excommunicated the iconoclasts in 731.

With the iconoclastic threat removed, the popes turned to the Frankish kingdom for assistance against the Lombards, availing themselves of the great devotion to St. Peter existing among the Franks and the new Carolingian (Carlovingian) dynasty. The king of the Franks, Pepin (r. 751–768), invaded Italy and subdued the Lombard king Aistulf (r. 749–756), who was threatening Rome, and, in 755, compelled him to turn over the cities he had occupied to Pope Stephen II. The donation of Pepin, as the conquered territory was called, included the Roman duchy, the former Exarchate of Ravenna, and the Pentapolis (the Adriatic cities of Ancona, Fano, Pesaro, Rimini, and Senigallia). It formed the basis of the subsequent temporal power of the papacy. The pope made Pepin patrician of Rome. When King Desiderius (r. 756–774) threatened a new Lombard expansion, Pepin's son Charlemagne (Charles the Great, r. 768–814) invaded Italy, dispossessed the king, and appointed himself king of Lombardy, in 773. In the following year, Charlemagne confirmed Pepin's donation to the pope. The name Kingdom of Italy came into use, replacing that of Kingdom of Lombardy.

The Franks governed the conquered territory in collaboration with the Lombards. They replaced the dukes with counts and established margraves in the larger border states. Franks and Lombards continued to use their own laws, while the Italians and Romans followed Roman

law. In central Italy, the Duchy of Spoleto continued to exist as part of the Italian kingdom. The papal domains were under the suzerainty of Charlemagne, who was, like his father, given the title of patrician of Rome. Meanwhile in southern Italy the dukes of Benevento took the title of princes of the Lombards and wavered between Frankish and Byzantine sovereignty. The principalities of Salerno and Capua later separated from Benevento, while the Duchy of Naples remained Byzantine but had an autonomous government. Sicily and Calabria were directly subject to Constantinople. The general picture shows an increase in the number of Italian subdivisions and local distinctions. After 827 the Saracens, who had settled in Sicily, extended their control in southern Italy, even, as in 846, attempting raids on Rome. (The Saracen conquest of Sicily was completed in 878.)

On Christmas Day in the year 800, on the initiative of Pope Leo III, Charlemagne was crowned emperor of the Romans in Rome. A dual conflict was to result, first between emperor and pope, then between Frankish and Byzantine empires. The Frankish empire itself was divided among Charlemagne's three grandsons in 843 by the Treaty of Verdun. (See also CAROLINGIANS; CHARLEMAGNE; CHURCH STATES; FRANCE—27. *History*.)

In the Carolingian period, the Kingdom of Italy was at times governed by a king as imperial vicar, and at times by a king-emperor. Royal-imperial authority was fairly effective until the death of Emperor Louis II (r. 855-875). The quarrels between the French and German Carolingians marked the beginning of the disintegration of imperial power, and the process was accelerated after the deposition of Emperor Charles III (called the Fat), in 887. In this period, feudalism reached its fullest development in Italy. Local lords became masters of their territory. Repeatedly the Italian crown became a bone of contention among warring pretenders who followed one another in rapid succession. In Rome, the local aristocracy gained control early in the 10th century. Power was concentrated in the hands of Theodora, wife of a senator, and her daughter Marozia, who married a Lombard adventurer, Alberic I. This period, called the pornocracy, or rule of profligate women, was brought to a close by Alberic II (r. 932-954), an able ruler who was made prince and senator of the Romans.

In the same period, we find another energetic sovereign in Hugh, count of Arles, who was king of Italy from 926 to 947, ruling jointly with his son, Lothair II, after 931. Hugh was defeated in 945 by Berengar II (r. 950-961), who, in his turn, was first made a vassal and then entirely dispossessed by Otto I, king of Germany (r. 936-973). In 962, Otto was crowned emperor in Rome.

FROM THE ESTABLISHMENT OF THE HOLY ROMAN EMPIRE TO THE COUNTER REFORMATION

The six centuries extending from the coronation of Otto to the Treaty of Cateau-Cambrésis may be divided into three major periods. The first, in which the German emperors, the popes, and the rising Italian cities vied for power, lasted until the early 14th century. It was followed by a 150-year period in which the various Italian principalities at first contended with each other and then reached a state of

equilibrium. The third period extended from the French invasion in 1494 to the final establishment of Spanish hegemony in the peninsula in 1559.

The Holy Roman Empire.—The union of the crowns of Germany and Italy with the imperial crown in 962 marked the effective beginning of the Holy Roman Empire of the German Nation.* The elected king of Germany was at once king of Italy and emperor. Although the two kingdoms remained separate, northern and central Italy became an appendage of Germany, and Germans were added to the Lombards and Franks in the Italian governing nobility. In the south, however, an attempt made in 982 to expel the Saracens failed.

Under the first three emperors of the house of Saxony—Otto I (r. 962-973), Otto II (r. 973-983), and Otto III (r. 983-1002)—The Kingdom of Italy remained in quiet subjection to the empire. Rome, in contrast, showed repeated hostility to the emperors and the popes appointed by their orders. Under the last Saxon, Henry II (r. 1002-1024), an anti-German party gained ground in northern Italy as well, and proclaimed Ardoïn (Arduin), marquis of Ivrea, king in 1002. His success was short-lived, however, and he was deposed by Henry in 1014.

The first two emperors of the Franconian or Salian dynasty, Conrad II (r. 1024-1039) and Henry III (r. 1039-1056), encountered far greater difficulty than had the Saxons in governing northern Italy. This was particularly true of Milan, where the middle-class citizens, at first in agreement with their bishop and later in opposition to him, showed an independent spirit. In the south, Norman chieftains, who had taken part in local quarrels between Lombard princes and citizens of Apulia and the Byzantine governors, gradually acquired power and defeated expeditions sent by the emperors against them.

In Rome, the papacy, which, after the reign of the Ottos, was once more controlled by the local aristocracy, had lost most of its prestige. In 1046, Emperor Henry III intervened and nominated Clement II, the first of a series of German popes. With Henry's support, Clement and his successors inaugurated reforms for which the religious orders and many leading persons had appealed. In particular, the reform movement fought simony and clerical marriage.

Under Henry IV (r. 1056-1106), the struggle against simony was transformed into a fight against the royal privilege of conferring investitures upon high church officials, a privilege which gave the emperor control over church affairs. In 1075, Pope Gregory VII (Hildebrand, r. 1073-1085) issued a decree against lay investitures. He excommunicated Henry, who, however, by presenting himself at Canossa, was absolved. In 1084, Henry deposed Gregory and was crowned by the antipope Clement III. The investiture question was finally settled in 1122 by the Concordat of Worms, concluded between Emperor Henry V (r. 1106-1125) and Pope Calixtus II (r. 1119-1124). The concordat was a compromise, providing for different methods of episcopal appointment in Germany and Italy. See also GERMANY—3. *History*; HOLY ROMAN EMPIRE.

The Two Sicilies and the Communes.—During the struggle between the empire and the

* Actually, the designation holy was not used until after 1155, when Frederick I was crowned emperor.

papacy, important changes were taking place in Italy. Southern Italy passed entirely under the domination of the Norman brothers, Robert Guiscard and Roger I of Hauteville. In 1059, the reformist papacy, in order to gain support against the Roman nobility and the emperor, recognized Robert Guiscard as duke of Apulia and Calabria. With the capture of Bari in 1071, he eliminated the last seat of Byzantine power in Italy. Meanwhile, the brothers had begun the conquest of Sicily from the Saracens, and, in 1071, Roger became count of the island. Count Roger II (r. 1105–1154) assumed the title of grand count, and, in 1130, having inherited the Duchy of Calabria and Apulia from his cousin William, united the Norman domains on both sides of the Strait of Messina and was crowned king of the Two Sicilies. In this way, the entire south was united into a single kingdom, which was subtracted from the Byzantine Empire and placed under papal suzerainty. (See also SICILIES, KINGDOM OF THE TWO.)

An entirely different development was occurring in northern Italy, with the growth of a number of separate republics, the communes. Despite the disappearance of the Roman municipalities in the 6th century, the cities had preserved an individual life and character, not only as centers of population, but also as episcopal sees and as administrative headquarters of dukes and counts. The development of courts on the estates had hurt them economically, and even more injurious was the growth of feudalism, which concentrated power in the hands of the lords, who lived on their estates, and so deprived the cities of political influence. The city dwellers became to a certain extent the vassals of the feudal lords. Nevertheless, the importance of city bishoprics remained and it grew with the extension of episcopal power, particularly under the Ottos. In greater or less degree, the sovereign privileges of the bishops placed them in charge of the actual government of their cities. Because of the press of ecclesiastical duties, they delegated a good deal of administrative power to lay citizens. After about 850, the cities of northern Italy began to display a certain independence of their bishops, as well as of the feudal lords.

The principal cause of the revival of communal spirit was the development of economic life, and particularly of trade, with a concomitant increase of urban population. Economic revival became general in the 11th century and was intensified in the 12th, partly as a result of the Crusades. Italy, particularly Venice and the Po Valley, became the clearinghouse for trade between the East and central Europe. Currency changed hands in unprecedented amounts, causing a decline in the value of landed property and also facilitating its exchange. Traders and artisans organized *arti*, or guilds, uniting the members of each profession within a city. They exercised a monopoly over the economic life of the cities, and also offered their members protection and social security. The associations of traders, organized in Italy before those of other European countries, became instruments for co-operative investment and the sharing of profits. Out of them developed a number of supplementary business enterprises, including storage facilities, banks, clearinghouses, commercial papers, and the establishment of branches. Together with the merchants and artisans, the small

landowners gained in importance. Some were *secondi militi*, or minor nobles, who, while owning small landed estates, lived in town in order to take an active part in industry or commerce.

Out of the free association of these craft and trade guilds, at different times and in different ways, the communes came into being. The commune originated as a private organization, but gradually came to take over part of the administration of the city and so evolved into a public body. It did not at first try to supersede the authority of the bishops or feudal lords, but existed beside them and in active competition with them, limiting and combating their interference by organizing a growing number of individuals and public activities and by endeavoring to bring all the inhabitants of the city and its adjoining territories under its own leadership. In the commune, the Italian people acquired a distinctive and autonomous personality; after centuries they were once more a subject and not an object of history.

Although the communes upheld their authority against alleged ecclesiastical and feudal rights, they did not strive for complete autonomy, or for what we might term state sovereignty or independence from superior authority. The Italian communes recognized the sovereignty of the emperor and king of Italy. We might even say that the communes replaced the great feudal lords in their relationship with the sovereign. In fact, once they had reached maturity, the autonomy of the communes in ordinary times appears to have been complete.

In the first communes, a minority of citizens distinguished by birth, social position, or wealth took charge of the government. The *popolo grasso* (big people), as they came to be called, were mostly minor nobles and rich burghers who rapidly formed a new aristocracy which, besides possessing ready money, had acquired land, thus taking the place of the ancient nobility. Later, the minor artisans and dependents of the larger guilds—the so-called *popolo minuto* (little people)—grew in importance. The contest between the two groups for participation in city government took place through the guilds. Alongside the craft guilds or *arti* were the *societates armorum*, or armed companies, militia based mainly on the sectional divisions of the city, in each of which citizens were organized by a leader for the maintenance of public order and for defense against attack from outside the city.

The supreme governing body in the commune was the assembly of all citizens enjoying political rights: it was called *parlamento*, *concione*, or *arengo*. The assembly elected magistrates and passed on city bylaws, declarations of war, and peace treaties. More restricted bodies, such as the *consiglio di credenza* (fiduciary council), assisted the city magistrates in an advisory capacity. The magistrates were the administrative and judicial executives, and they commanded the city militia in time of war. In most cities they came to be called consuls, probably in imitation of Rome, because the memories of ancient Rome and the consciousness of being its descendants were characteristic elements of the renewed Italian national sense and of the civic pride of the communes. Consuls existed in Pavia in 1084, and in Milan in 1097.

Communal development in northern Italy generally preceded that in central and southern Italy.

Florence had its first consuls in 1138, while in Lucca they had appeared shortly after 1080. Development was even more precocious in the maritime cities of Pisa and Genoa (c. 1000). Venice continued her uninterrupted autonomous development without passing through a feudal period. The old real estate-owning aristocracy was gradually replaced by wealthy merchants. The head of the state was the doge, at first elected and later appointed for life. His power, however, was gradually superseded by the growing influence of the aristocracy.

The commercial expansion of Venice took place mainly in the eastern Mediterranean, through trade with the Byzantine Empire and the Moslems, and later with the Kingdom of Jerusalem and other states founded by the Crusaders. This expansion went hand in hand with the republic's growing naval power and territorial acquisitions. Venice endeavored to dominate the Adriatic and defend it against the Slavic people and the Saracens. To this end, she colonized the coasts of Istria and Dalmatia.

The maritime cities of Campania—Naples and Amalfi—had a similar development, though on a far smaller scale than that of Venice. However, they lost their autonomy after the Norman conquest, a fate which also befell other southern cities, particularly in Apulia, where communal organizations were already well under way. See also CRUSADES; GUILD; and articles on individual cities.

Conflict Between Communes and Empire; the House of Anjou.—Until the middle of the 12th century the communes encountered little opposition from the empire, which was occupied with dynastic struggles. They did not, therefore, feel the necessity of forming defensive leagues and concentrated on local expansion, which resulted in almost constant conflicts between one city and another. The cities formed counterbalancing alliances for war or for the maintenance of peace.

Emperor Frederick I (called Frederick Barbarossa, r. 1152–1190) of the house of Hohenstaufen or Swabia, having consolidated his power in Germany, resumed, in 1154, the program of the Ottos for the conquest of Italy. In all, he made six expeditions to the peninsula, coming into conflict with the communes in the north, with the papacy in the center, and with the Norman kings—William I (r. 1154–1166) and William II (r. 1166–1189)—in the south. In 1167, the communes formed the Lombard League, which entered into alliance with Pope Alexander III (r. 1159–1181) and William II. Frederick was defeated by the league's army at Legnano, on May 29, 1176. In the following year, he detached the pope from the league by the Treaty of Venice, and in 1183, came to an agreement with the communes at Konstanz (Constance), recognizing their right to local autonomy, but preserving imperial sovereignty. The league was dissolved and lost the opportunity of forming a permanent confederation, as the Swiss cantons were to do in 1291. In the south, the Hohenstaufen dynasty not only made peace but contracted a matrimonial alliance with the Normans. In 1186, Constance of Sicily, heiress of William II, married Frederick's son, Henry VI, who became emperor in 1190 and king of the Two Sicilies in 1194, after he had overcome the forces of King Tancred (r. 1190–1194).

After Henry's early death, in 1197, two contenders—Philip of Swabia (r. 1198–1208; never crowned), leader of the Waiblingen party, and

Otto IV of Brunswick (r. 1198–1218; crowned 1209), leader of the Welfs—fought for the imperial crown, and the power of the empire consequently declined. The communes of central Italy were able to take advantage of this situation, and so was Pope Innocent III (r. 1198–1216), who began by favoring Otto and later negotiated with Philip. Innocent was an active politician who aspired to the temporal leadership of the Christian world. He recovered a certain amount of power in Rome, where a commune had been formed in 1143–1144, and renewed papal sovereignty over Umbria and Marche.

In 1210, Innocent excommunicated Otto IV, and in 1212 he secured the election of the son of Henry VI, Frederick II (r. 1212–1250), who had been king of the Two Sicilies since 1198. Exploiting the resources of Sicily, which was ruled by a centralized, despotic government, he attempted to dominate Italy, only to come into conflict with the papacy in 1227, when he was excommunicated. (He was excommunicated for a second time in 1239, and again in 1245.) The Italian cities took sides for or against the empire. The former were Ghibelline (Ital. *Ghibellino*, a corruption of the German *Waiblingen*); the latter, Guelph or Guelf (Ital. *Guelfo*, from the German *Welf* family). (See also GUELPHS AND GIBELLINES.) The Guelphs, led first by Milan and then by Florence, gained supremacy. Frederick died excommunicate, without having triumphed over communal autonomy in northern and central Italy or over the papacy.

An illegitimate son of Frederick II, Manfred, became king of the Two Sicilies (r. 1258–1266) and leader of the Ghibellines. In the absence of imperial power, during the interregnum between Conrad IV (r. 1250–1254) and Rudolf I (r. 1273–1291), Italy's situation was in many ways reminiscent of that existing at the close of the Lombard period, and there was some possibility of finding a national solution. The popes, however, fearing Manfred's power, called Charles of Anjou, brother of King Louis IX of France, to Italy, and in 1266 he was crowned King Charles I of the Two Sicilies. Manfred was defeated and killed at Benevento in 1266, and his young nephew Conradin, the last Swabian, suffered a similar fate, at Tagliacozzo in 1268.

The dominion of the house of Anjou over the entire kingdom of the Two Sicilies was short-lived. Sicily, dissatisfied with the harsh rule of Charles I and with French customs, rebelled in the Sicilian Vespers (q.v.) in 1282, and called upon King Pedro III of Aragon for aid. The French were expelled from the island and the crown of Sicily was joined with that of Aragon. (In 1296, Frederick II, brother of James II of Aragon, became ruler of the separate Kingdom of Sicily.) The Angevins, who remained rulers of the Kingdom of Naples (in 1285, Charles was succeeded by his son Charles II, d. 1309), attempted to reunite the two Sicilies in a series of wars with the Aragonese, but were unsuccessful. (Angevin claims to Sicily were finally abandoned in 1373, by Queen Joanna I of Naples.) They had no greater success in their attempt to consolidate their dominion in Italy as leaders of the Guelphs. They played a major role, however, in thwarting the last imperial attempts to control Italy, undertaken by emperors Henry VII of Luxembourg (r. 1308–1313) and Louis IV of Bavaria (r. 1314–1347), but even in this respect the importance of Florence was greater than

theirs. See also SICILIES, KINGDOM OF THE TWO; and separate biographies of important figures.

The Signories.—At the end of the 13th century, Italy consisted of several hundred states, which included the kingdoms of Naples and Sicily and the Papal States, these in turn being broken up into a number of communes. Tuscany and Lombardy were divided into a large number of communes and a few feudal domains: The leading commune in Tuscany was Florence, followed by Pisa, Siena, and Lucca. In Lombardy, Milan was outstanding, followed by Pavia, Alessandria, Brescia, and Verona. In the west, Piedmont contained a few important feudal domains, such as the Marquisate of Monferrato and the County of Savoy (Savoia; Savoie). The counts of Savoy (dukes after 1416), however, because of their origin and their possessions beyond the Alps, were Burgundians rather than Italians. (See SAVOY, HOUSE OF.) In the east, in Friuli, the patriarch of Aquileia was predominant. In Liguria, Genoa had extended her dominion along the eastern and western Riviera, while in Venetia, Venice had not as yet begun her territorial expansion.

In 1297, with the transformation of the Gran Consiglio (Great Council) into a restricted, hereditary body, Venice became an aristocratic oligarchy. Meanwhile, transformations had taken place in other Italian cities. Around 1200, the communes, which had originated as unions of citizens, tended to break up into opposing groups. The nobles, who had played a leading role in founding the communes, gained in strength as their ranks were increased by country nobles who had come to live in town by necessity or choice, and by the rich burgher families which had attained nobility. The middle class, with its growing prosperity, built up its own organizations (*societates mercatorum*) and demanded participation in city government with its own officials (*consules mercatorum*). There were, therefore, two classes, *milites* (nobles) and *pedites* (commons), which organized and formed two states within the commune. Later, the wealthy burghers (*popolo grasso*) were challenged by the artisans (*popolo minuto*).

The original commune had been governed by a *collegio*, or assembly, which provided a form of proportional representation for the various classes and parties. As the interests of the classes drew further apart, the *collegio* became unable to function. In order to resolve this impasse, an attempt was made to substitute a single executive for the governing body—a magistrate chosen outside and above the parties, the *podestà*. (Florence had its first *podestà* after 1202.) The growing strength of the *pedites* brought about the introduction of another magistrate, the *capitano del popolo*. The *capitano* presided over the *consiglio del popolo* (people's council); the *podestà*, over the *consiglio del commune* (city council). Finally, the leaders of the principal guilds (*priori*) became city magistrates, and in some cities, among them Florence, were the most important.

Local feuds between social groups and rival families were interwoven with quarrels between cities, exiles taking refuge in rival cities, and with the general conflict between papacy and empire. They were consequently classed as Guelph or Ghibelline. Alliances of the two parties formed chains through entire regions, and even from one region to another.

Neither the institution of the *podestà* nor the

predominance of the people, which amounted to class dictatorship, sufficed to restore internal balance. A solution was sought through the *signoria*, or signory, which was a similar, but intensified and more permanent, form of government by *podestà*. Milan adopted this system in 1259. In the various cities, the *signore*, or lord, as he was called, became the head of the commune, following election by the popular assembly. Later, popular elections gave way to imperial or pontifical investiture. Republican institutions and magistrates survived for longer or shorter periods but lost both their significance and their autonomy.

The signory, in its fundamental character, in which mercenary armies played an essential part, and in its manner of functioning, was a monarchy. The people were excluded from the government and did not participate in political life. The process of development and political education which the communes had begun was destroyed for centuries to come. The monarchical character of the signory reached its full development when the office of *signore* became hereditary. Although political freedom was lost, the consolidation of the signory did insure order and impartial justice, respecting all parties and social classes. The institution of the signory hastened the grouping of minor cities around the larger centers, a process which had begun in the communal period. In this field also, the signory gave assurance of a greater degree of impartiality between the commune of the capital and those of the aggregated cities. The signory became an agglomeration of communes governed as a state by a single person. In time this personal unity evolved into a closer bond. Local autonomies were gradually replaced by uniform institutions and magistrates common to all, through which the *signore* governed and administered his state. The old elective magistrature was gradually replaced by a uniform and centralized bureaucracy. The signory, therefore, was the first step toward the development of the modern state, not only in the extension of its rule, but also in the organization of its government.

Italian Unity and Communal Civilization.—Progress in internal state unity was not accompanied by a trend toward complete external autonomy. Neither the signories nor the principalities which followed them claimed absolute independence of the empire, nor was any progress made toward national unity. The empire and the papacy were regarded as general directing principles, but they were at the same time too universal and too weak to bring about unity. Federalism, on the other hand, was not developed beyond brief, local enterprises. The number of Italian centers, the interlocking interests, and the physical nature of the country, unsuited as it was for cantonal demarcation, prevented the development of federalism and helped to maintain the fluidity of Italian political life. Italy was too uniform to permit rigid divisions, too varied to adopt a single constitution.

Nevertheless, an Italian national consciousness did exist. There was a historical unity which went beyond the specific internal problems of the various communes. There was also a unity of ethnic inheritance, of language, culture, and family life, and of economic, religious, and political affairs. A closely knit chain bound the life of each city or regional state with that of its neighbors.

This basic national unity became particularly apparent in the uniform and high civilization of

communal Italy, especially during the period from the birth of St. Francis of Assisi (1182) to the death of Dante Alighieri (1321). Italy played a leading part, on a level with, or immediately after, that of France, in the revival of European civilization in the 11th century. A product and an instrument of this revival were the universities, with which Italy rivaled France. The University of Paris held first place in theology, the University of Bologna in law. In theology and scholastic philosophy, Italy was second only to France. She made an important contribution to the Western rediscovery of Aristotle (which became all important in medieval philosophy), with the translation from the Greek texts undertaken in Sicily, and the most imposing scholastic synthesis was the work of an Italian Dominican, St. Thomas Aquinas (1225?-1274). Italy accomplished, with Bologna as its center, the resurrection of Roman law through the contribution of a long series of famous scholars. Moreover, canon law, which had papal Rome as its cradle, was studied intensively.

The 12th century saw a new flowering of Latin literature, which no longer seemed the outworn repetition of ancient formulas or the medium of rough transcriptions compiled for immediate use, but the adequate expression of a new moral and intellectual life. It prospered particularly in the historical field. Besides universal chronicles, we find a number of analytical records describing the events in the communes and in contemporary Italy in general. In these works we frequently note a vivid and even politically partial interest in the recorded events. Sometimes they attained real art, revealing the personality of the observer and writer. A masterpiece of this kind is the *Cronica* (1168-1287), by the Franciscan friar Salimbene (Ognibene di Guido d'Adamo, 1221?-1289). In the field of pure literature, Italy was in the lead with the literary studies known as *ars dicandi* (art of composition).

During the first half of the 13th century—later than in other Latin countries because of the greater vitality of the Latin tradition in Italy—the vernacular literature began to appear. Through it the life of the people found direct expression, the obstacle of an erudite language having been removed. In the early days, Italian vernacular was largely a reflection of French models, as is evident in the Provençal-sounding lyrics of the Sicilian school which had been formed at the court of Emperor Frederick II. In Bologna and Tuscany, during the second half of the 13th century, an original lyric—the *dolce stil nuovo*—came to be used. It was finished and powerful, and was used even by the youthful Dante. The sacred *lauda* (hymn of praise) had a more popular character and was fostered by the contemporary religious movement. It gave birth to the dramatic *lauda* and to the religious drama in the vernacular.

After 1300, Italy made such rapid progress in the field of culture as to stand in the forefront of Europe during the late Middle Ages. Italian culture of the *trecento* (14th century), while still imbued with the medieval spirit, had a distinctly lay character, both in its content and in the men who created it. It was actually the first great lay culture since the decline of the Roman Empire. This aspect, as well as the renewed interest in classical culture, made the Italian *trecento* a forerunner of the Renaissance. Almost contemporaneously, Tuscany gave birth to three giants of the new European culture. Dante Ali-

ghieri (1265-1321) gave in the *Divina Commedia* the most powerful synthesis of the Middle Ages, at a stroke raising the level of the Italian vernacular to the height of classical Latin literature, and by far surpassing all contemporary Romance literature. Petrarch (Francesco Petrarca, 1304-1374) in *Il Canzoniere* transformed the Provençal lyric and the *dolce stil nuovo* into a fine and powerful instrument of psychological analysis and made it an expression of a very personal sensitivity. In his Latin works, by promoting classical culture, he originated a historical and aesthetic understanding of the age, which was no longer medieval but modern. Giovanni Boccaccio (1313-1375) in the 100 tales of the *Decameron* created an entire world observed in everyday life, and originated the classic-sounding Italian prose, with its involved but harmonious and majestic periods. (See also sections on *Language* and *Literature*.)

Romanesque art, which was one of the major manifestations of Europe's new spiritual life, had one of its creative centers in Italy around 1100, although there it was tempered by the persistent influence of antiquity. It flourished especially in northern Italy with the so-called Lombard architecture (Sant' Ambrogio in Milan, the cathedral in Modena), and in central and southern Italy (Cathedral of Pisa), where the basilica tradition was strongest. In Venice, St. Mark's combined Byzantine architecture with some Romanesque elements. At the end of the 12th century, lay architecture also flourished in portals, towers (as in Pisa), and communal halls.

From the second half of the 12th century to the first of the 13th century, Romanesque sculpture attained its greatest development in intimate relation with ecclesiastic and lay architecture. Around 1200 we meet the outstanding personality of Benedetto Antelami (fl. 1177-1233), in whose sculpture we find the contained and powerful expression of a profound religious and moral life. During the first half of the 13th century, painting also broke away from Byzantine influence and gave evidence of a fresh and robust expression analogous to contemporary sculpture.

In the middle of the 13th century, Gothic art reached Italy after having flourished for a century in France. In Italy, however, the distinctive character of the Gothic was far less evident. Romanesque structures persisted, and Gothic was used mainly as a decorative adjunct. Italian Romanesque-Gothic architecture, both civil and religious, produced its masterpieces, especially in Tuscany and Umbria. More properly Gothic, but belonging to a far later period, is the Cathedral of Milan. The Gothic style influenced sculpture much more decisively, with Nicola (or Niccolò) Pisano or d'Apulia and his son Giovanni Pisano, and painting with the Siennese school, while the Florentine painter Giotto di Bondone (1276?-1337)—one of the most originally powerful personalities in all art history—stood apart as a precursor of the Renaissance. Dante and Giotto were the highest manifestations of Italian spiritual life, which had reached its full expansion. (See also section on *The Arts*; *GOthic ARCHITECTURE*; *ROMANESQUE ARCHITECTURE*.)

Characteristic of Italian art and literature at this period was their close relationship to the civil and religious life of the people. Italian religious life reached its greatest and most original intensity during the period from the 11th to the 14th centuries, in which the revival of lay culture

and civilian life was closely associated with ecclesiastical life and tradition. This was true despite the conflicts caused by the schismatic and heretical movements of Arnold of Brescia (1100?-1155, q.v.); the Waldenses; the Cathari, who were akin to the Albigenses of France; and the Fraticelli (Little Brothers), an offshoot of the Franciscans; and the stern repression of these movements by the church in the Inquisition (founded by Pope Innocent III around 1203). The principal instruments of this spiritual unity were St. Francis of Assisi (1182-1226), a highly original religious personality whose European-wide influence lasted for centuries, and the Franciscan movement. This movement was regularized by Honorius III in 1223, through the founding of the Franciscan Order, which collaborated with the other mendicant order, the Dominicans or Preaching Friars, founded in 1215 by the Spaniard St. Dominic (1170-1221), and also widespread in Italy. The Franciscan Order was harassed for more than a century by internal quarrels between different tendencies, some of which—such as the Fraticelli movement—brought it into conflict with the church. See also ALBIGENSES; CATHARI; DOMINICANS; FRANCISCANS; WALDENSES.

The Principalities and the Equilibrium Policy.—Following the fruitless attempt, in 1327-1330, of Louis IV to control Italy, the emperors practically abandoned the country. (Frederick III [r. 1440-1493] was the last emperor to be crowned in Rome by the pope, in 1452.) The papacy continued to be active in Italian politics, but first the popes' absence from Rome during the Avignon period (the so-called Babylonian captivity) from 1309 to 1377, and then the Western Schism (1378-1417), which set up a pope in Avignon against the pope in Rome, deprived their actions of effectiveness. (See also PAPACY.) Moreover, the Kingdom of Naples, following the death of Robert of Anjou (r. 1309-1343), ceased to have any guiding influence, while the Kingdom of Sicily stood apart and, upon the death of Frederick III (r. 1355-1377), became a dependency of Aragon (in 1409 it was joined to that kingdom).

From the mid-14th century, therefore, local influences were predominant in Italy. Naples and Sicily fought one another and were torn by internal strife, and in the Papal States, despite temporary reforms, the anarchy of local communal and feudal governments persisted. Between 1347 and 1354, there was an unsuccessful revolution against aristocratic power in Rome, led by Cola di Rienzi, who was killed by his opponents. The Florentine commune dominated Tuscany, while in Lombardy the Visconti (q.v.), lords of Milan after 1311, were able, in 1387, to overthrow the Scaligeri (della Scala) family, which had ruled Verona from 1260. Coalitions were formed against the Visconti, in which Florence and the popes joined, but these did not succeed in shaking their supremacy. Gian Galeazzo Visconti (r. 1378-1402), who was appointed hereditary duke by Emperor Wenceslaus in 1395, extended his dominion from Piedmont to Venetia, from Bologna to Pisa, and aspired to the crown of Italy.

After the death of Gian Galeazzo, the Visconti dominion fell apart. In Venetia, their inheritance was taken over by Venice, which had become the most powerful state in the peninsula, constantly tending to increase its territory, though lacking a general Italian policy. The power of the Visconti was reconstructed by Filippo Maria (r. 1412-1447), who was opposed by an alliance

of Venice and Florence. For three years after Filippo Maria's death, Milan was a republic and then passed into the hands of a new ducal dynasty headed by Francesco Sforza (r. 1450-1466), who had married Bianca Maria Visconti. (See also SFORZA.)

In the meantime, the power of the papacy was reconstituted by Martin V (r. 1417-1431), who brought to a close the Western Schism, and Naples and Sicily were reunited by Alfonso V of Aragon (Alfonso I of Naples, r. 1443-1458), who drove out the Neapolitan king, René I, duke of Anjou, in 1442. Florence, the most tenacious of the republics, was practically governed by the Medici (q.v.) after 1434, when Cosimo the Elder had with the support of the people defeated the oligarchy of the Albizzi family. Although a number of minor states continued to exist, these three principalities, with Venice and Milan, governed Italy.

During the second half of the 15th century, not without wars and disputes, a system of equilibrium was established among the five Italian powers under the patronage of Lorenzo de' Medici (r. 1469-1492). It was, however, an unstable equilibrium, deriving, as it did, not from a desire to enforce justice and peace, or even from the consciousness of political solidarity, but simply from mutual jealousy and suspicion. Temporary leagues were formed, but no stable and well-constituted federation was organized.

The independence of Italy was also imperfect and precarious. The emperor's nominal authority could always be re-established. Moreover, French control had been extended to Asti, and was often exercised in Genoa as a counterbalance to the domination of the Visconti. The Angevins, whose inheritance passed to the crown of France upon the death of Duke René in 1480, were perpetual pretenders to the Kingdom of Naples. Upon the death of Alfonso I, Naples and Sicily were again separated, Naples passing to his son Ferdinand I (r. 1458-1494), and Sicily being joined once more to Aragon. An Italian national consciousness, which might have opposed such foreign acquisitions, was lacking, particularly since the conquests seemed to have a personal character and the acquired states maintained their own individuality. The art of politics flourished in Italy, and Italian statesmen enjoyed a European reputation for ability and shrewdness. But their ability degenerated into virtuosity and intrigue, and they lacked vision or a direct and tenacious policy. For them, the pursuit of public affairs was a matter of personal interest, a problem of how to maintain and increase their power, and not a national service to be performed as a conscientious duty. Moreover, the various states (except, in part, Venice) were internally weak. They were still largely conglomerations of cities and territories—no longer city-states and not as yet unified modern states. The people, who no longer shared in public life, were estranged and passive.

The Renaissance.—The isolation of the governments from the people, which had developed during the 15th century, was accompanied by a detachment of cultural from social life. The traditional values of the Italian Middle Ages—religion and city—were shaken by the religious and political crisis. Beside these values, which were not forgotten but had lost their hold on popular feeling and were no longer so influential as they had been, we find in the higher levels of culture a

development of the individual, freed from the bonds of tradition but indifferent to the life of the community, and a pursuit of letters and science for their own sake. This spirit of free inquiry produced the cultural and artistic splendors of the Renaissance, which made of Italy during a century the mistress of arts and civilization of Europe. The political indifference of the age, however, prevented the development of national unity and made it impossible for Italy to withstand renewed foreign aggression.

Besides this change of point of view, there was in the 15th century a notable increase in the study of the authors of classical antiquity, a movement that has properly been termed humanism (q.v.). It meant research into original texts, correction of translations, and critical editions. Extremely important was the revival of Greek studies brought about by learned Byzantines—such men as Manuel Chrysoloras (1355?-1415) and Johannes Argyropoulos (1416?-?1486)—who had settled in Italy, and by their pupils. Together with the study of the classics, an original humanist literature developed in which Latin was no longer the medieval tongue modified by the use of vernacular, but became an art Latin claiming to be the original tongue of classical antiquity.

Italian literature, neglected during the 15th century in favor of Latin, rose to new heights at the beginning of the 16th century. It attained European fame and influence with the chivalresque poem *Orlando Furioso* by Lodovico Ariosto (1474-1533), which was followed by the epic poem *Gerusalemme Liberata* by Torquato Tasso (1544-1595); with the Petrarchan lyric school of Pietro Bembo (1470-1547); with the new classical school of comedy and tragedy; with the prose featuring ample and harmonious periods in oratory; with didactic writing (*Il Cortegiano* by Baldassare Castiglione, 1478-1529); and with political history. (See also section on *Literature*.)

The splendor and European influence of the Renaissance in the field of arts was as great or greater than it was in letters, with the Florentine, Venetian, and Lombard-Roman schools of painting and sculpture; with the new architectural styles of Filippo Brunelleschi (1377?-1446), Bramante (real name Donato d'Agnolo, 1444-1514), and their successors, who ingeniously renewed the ancient forms; and with the great and many-sided personalities of Leonardo da Vinci (1452-1519), Raphael (Raffaello Santi or Sanzio, 1483-1520), and Michelangelo Buonarroti (1475-1564). The Italian Renaissance created modern art and transmitted it to the other countries of western Europe. (See also section on *The Arts*.)

Modern science also received its first impetus from the Renaissance. The direct study of classical texts and insatiable curiosity seeking new paths led thinkers to shake off in science, or in natural philosophy, as it was called, the Aristotelian yoke. Scholastic philosophy, which had placed ancient thought at the service of faith, was replaced by the direct study, as an end in itself, of ancient authors, especially Plato and Aristotle. The result was a far freer and more intrepid philosophical thought, nourished by rationalism, which often neglected dogma and sometimes questioned it. (See also section on *Science*.)

Modern political history was also born in

Italy, with Niccolò Machiavelli (1469-1527), author of *Il Principe*, and Francesco Guicciardini (1483-1540), who wrote *Storia d'Italia*. Philology and erudition had their masters in the humanists Piero Vettori (1499-1583) and Carlo Sigonio (1524-1584).

The French and Spanish Invasions.—At the end of the 15th century, a divided Italy faced a united France and a united Spain, both of which wanted to increase their power by territorial acquisitions in the peninsula. The Italian principalities, instead of forming a union against foreign invasion, were drawn into the contest between France and Spain and sided with one or the other. France aspired to the Kingdom of Naples because of the Angevin inheritance, and to the Duchy of Milan because the duke of Orléans, the future King Louis XII (r. 1498-1515), was the grandson of Valentina Visconti, daughter of Duke Gian Galeazzo. Spain, already in possession of Sicily through the union of Aragon and Castile, opposed both French objectives.

The struggle began in 1494, with the invasion of the peninsula by King Charles VIII of France (r. 1483-1498), and ended with a Spanish triumph after Charles I, king of Spain (r. 1516-1556) and elected Holy Roman emperor as Charles V (r. 1519-1556), had defeated his rival Francis I, king of France (r. 1515-1547), and was crowned king of Italy by Pope Clement VII (Giulio de' Medici), in 1530. Empire and papacy were reconciled, after so many quarrels, over the body of Italian independence. The reconciliation was further confirmed by the final downfall of the Florentine republic (it had been restored in 1494, replaced by the Medici again in 1512, and renewed in 1527) in 1530, and the installation by the imperial armies of Alessandro de' Medici, a cousin of the pope, as duke in 1531. (His successor, Cosimo I [r. 1537-1574] was made grand duke of Tuscany in 1569.) The popes thereafter renounced the struggle for political supremacy in Italy, being satisfied with the Papal States, which the emperors, in their turn, fully recognized. The latter did not, however, exercise direct control over Italy, but renewed imperial sovereignty in the territory which had been the Kingdom of Italy. Empire and papacy, the supreme powers of the medieval world, which had lost all authority in the political field in matters which concerned western Europe, in Italy won out over local autonomies and the independent Italian states. With their victory, foreign domination was definitely established in the peninsula.

The two major contested principalities, the Kingdom of Naples and the Duchy of Milan, both passed to the king of Spain, who received the investiture for the first from the papacy, in 1504, and the second as a fief from the empire, in 1556. (Spain had controlled Milan since 1535, when Francesco II, the last Sforza duke, died.) Further French attempts against Spain by Francis and by Henry II (r. 1547-1559) failed. The Treaty of Cateau-Cambrésis (1559) sealed Spanish control of Italy. (In addition to the possessions already mentioned, Sardinia had been Aragonese since the end of the 13th century, and the State of the Presidii, an enclave in Tuscany, was now under Spanish control.) France abandoned all her Italian acquisitions. See also *FRANCE—History*; *SPAIN—History*; biographies of important figures.

FROM THE COUNTER REFORMATION TO
THE FRENCH REVOLUTION

The Counter Reformation and the 17th Century.—The Italian states which came under Spanish control in the 16th century retained separate administrations, preserving a formal individuality and local institutions. None of them, however, constituted an organic whole with powers derived from the will of the people. In the main, they represented class interests in conflict with one another. For this reason, they tended to favor the supreme foreign authority, which was largely absolute and met with little or no opposition. Such revolts as that of Masaniello (properly Tommaso Aniello) in Naples in 1647, and others in Palermo and Messina (1670) were inconsequential episodes.

Spanish hegemony in the peninsula encountered very little opposition from the Republic of Venice, the Papal States, or the Grand Duchy of Tuscany, all of which followed a neutral policy. The Duchy of Savoy, however, reconstituted after Cateau-Cambrésis by Emmanuel Philibert (r. 1553–1580), pursued an active policy with both France and Spain, endeavoring to extend its domains in Monferrato, Lombardy, and Liguria, as well as in France and Switzerland. Its success for the moment was limited, but the Duchy of Savoy eventually became the major independent power in Italy. (See also SAVOY, HOUSE OF.)

In all of these states, the passage from feudal to absolute government was smoothly accomplished. The most perfect despotism was probably that of the Republic of Venice, in which the oligarchy became increasingly restricted and rigid (Council of Ten; state inquisitors). The weakest was the papal power.

Religious absolutism went hand in hand with political despotism. The ideas of the Protestant Reformation at first spread widely in Italy, but they were soon crushed by the papacy, supported by the various governments, with the Inquisition or Holy Office (made universal in 1542) as its principal instrument. In 1559, the Inquisition was supplemented by the first index of forbidden books. The Catholic Counter Reformation, codified during the Council of Trent (Trento, 1545–1563), had its headquarters in Italy, with the papacy, the Jesuit Order (founded in 1534), and other religious orders, and its religious and moral influence permeated the Italian people. (See also COUNTER REFORMATION; JESUITS; REFORMATION; TRENT, COUNCIL OF.)

With the end of the Renaissance and the progress of the Counter Reformation, Italian culture lost the predominant position which it had held in Europe for about 200 years. In the countries beyond the Alps, particularly those of western Europe, new national cultural strains, once they had felt the vivifying influence of the Renaissance, developed autonomously and vigorously. Little by little, with a reversal of roles, they acquired a preponderant influence on Italian culture. This autonomous foreign evolution was noticeable in every field—philosophy, philology, physical and mathematical sciences, natural sciences, letters, and art.

Foreign influence was more evident in Italy in the scientific than in the artistic and literary fields. In philosophy as well as in science, Italy held an important place until the first years of the 17th century, but in the course of that century she fell behind other western European

countries. Post-Renaissance Italian literature commanded far less attention than science or philosophy, because there were no names which could compete with the great contemporary French, Spanish, and English writers. In art, on the other hand, Italy, and particularly Rome, was more than ever the land to which men turned for knowledge and inspiration. One and the other, however, were sought from the old masters, the landscape, and the classical ruins to a greater degree than from new artists. Italian painters and sculptors of European reputation became rare: a position of greater eminence was reserved to architecture, which spread widely outside of Italy with the baroque school. A great artist of European influence was the architect and sculptor Giovanni Lorenzo Bernini (1598–1680). (See also section on *The Arts*.)

During the first part of this period, Italy still enjoyed a leading place in scientific philosophy. She contributed to the definite advance from Aristotelian scholastic philosophy, with Bernardino Telesio (1509–1588), Tommaso Campanella (1568–1639), and especially Giordano Bruno (1548?–1600). An even greater impulse was given to modern science by Galileo Galilei (1564–1642), the great physicist and astronomer. But the imprisonment and exile of Campanella, the arrest of Bruno by the Inquisition and his death at the stake, and the retraction forced from Galileo concerning the Copernican system (1633), marked the extinction of independent thought in Italy. The country not only lost its intellectual primacy but dropped from the orbit of productive European culture, limiting itself to pure erudition and scholastic word battles. Modern thought lived and progressed outside of Italy. (See also section on *Science*.)

In the late 15th century, Italy had enjoyed an extraordinary economic prosperity, probably greater than that of any other part of Europe. This condition was altered simultaneously by political events and by geographical discoveries. The road to India, opened with the circumnavigation of Africa by Vasco da Gama, and the discovery of America by Christopher Columbus, transferred the center of world commerce from the Mediterranean to the Atlantic. This was a serious blow to Venice, Genoa, and all of Italy. In the Mediterranean, the predominant position of Venice was endangered and almost destroyed by the Ottoman Empire, which extended from Constantinople to Greece and Egypt. Isolated victories against the Turks, like the Battle of Lepanto (q.v.), in 1571, wrought no change in this situation until the end of the 17th century. The subsequent decadence of the Ottoman Empire was of advantage to Austria and Russia, not to Italy. Besides the Turkish menace, there were in this period raids of Moslem pirates from North Africa against the coasts of southern and central Italy.

18th Century Reformism.—The War of the Spanish Succession (1701–1714) brought to an end Spanish control of Italy. The treaties of Utrecht (1713) and Rastatt (1714) replaced Spain with Austria in Milan and Naples, a change which meant a better government in terms of order and administrative capacity. The duke of Savoy, Victor Amadeus II (r. 1675–1730), increased his territory in Piedmont with the acquisition of Alessandria and Monferrato. He also received Sicily with the title of king. In 1720, however, he was forced to cede Sicily

to Austria, receiving Sardinia in exchange. Thereafter, the territory of the house of Savoy was called the Kingdom of Sardinia. In 1748, by the Treaty of Aix-La-Chapelle (Aachen), at the close of the War of the Austrian Succession, the territory of the kingdom was extended to include that part of the Duchy of Milan west of the Ticino River. (See also SUCCESSION WARS; UTRECHT, PEACE OF.) Meanwhile, Tuscany passed, upon the extinction of the house of Medici, to Duke Francis of Lorraine (r. 1737-1745), who was married to Maria Theresa of Austria, and upon his death to their son, Leopold I (r. 1745-1790; later Emperor Leopold II). The advent of the house of Habsburg-Lorraine brought greater governmental efficiency to Tuscany. In 1734, the Kingdom of the Two Sicilies was freed from Austrian control and reconstituted as an independent state under a branch of the Spanish Bourbons. The first ruler, Charles IV (r. 1734-1759), upon his accession to the Spanish throne as Charles III, left the kingdom to his son, Ferdinand I (r. 1759-1806; 1815-1825).

These extensive territorial changes did not radically modify the condition of Italy, which remained divided under foreign control and impotent in international affairs. A far greater transformation took place in the internal policy of several of the Italian states. This was a period of governmental reform, led by Austrian Lombardy, Lorraine Tuscany (with the great figure of Leopold I), and, at some distance, Bourbon Naples. Their reforms were characterized by antifeudalism; administrative and bureaucratic reorganization on a uniform and centralized basis replacing the chaos of legislation, institutions, and strata of customary privileges; anticlericalism, or rather anticurialism (that is, limitation of the power of the church and especially of the pope in favor of the state); religious tolerance and incipient lay policy; and humanitarianism, which was especially manifest in the revision of penal law and in Tuscany went as far as the abolition of capital punishment.

These reforms, like similar ones outside of Italy, were largely the result of the application of the principles of 18th century rationalism. The spread of these principles in Italy, with the consequent spiritual revival of the nation, is the most important trend in this period. It marked the beginning of the Risorgimento (the rebirth of Italy). With this movement, Italy returned to the great, European-wide tradition of the Renaissance.

Italian culture made notable contributions to rationalism in the fields of history (Lodovico Antonio Muratori, 1672-1750; Pietro Giannone, 1676-1748; Giovanni Battista Vico, 1668-1744) and of economics and political science (Cesare Bonesana, marchese di Beccaria, 1735?-1794; Pietro Verri, 1728-1797; Antonio Genovesi, 1712-1769; Ferdinando Galiani, 1728-1787; Gaetano Filangieri, 1752-1788). As in the first *risorgimento* during the communal age, religious movements had a part in the second. Jansenism and Gallicanism (q.v.), which were associated in France, by joining with the 17th century Augustinian movement in Italy, emphasized the latter's innate anti-Jesuit character (see AUGUSTINIANS). Gallicanism and Jansenism gave the state a theoretical basis and a moral impulse in jurisdictional discussions with the church. They encouraged hopes and fostered

plans for ecclesiastical reforms of not merely political but moral value.

In the reforms undertaken by the governments and promoted by writers and thinkers there was a spirit both of civic progress and of moral and religious awakening. The reforms lacked popular appeal, however, and consequently had no wide national basis. The Italian thinkers of the 18th century reached a far more limited audience in Italy than would have been the case in either France or England. In general, the people remained indifferent and at times even hostile. Moreover, the rulers, who acquired added powers through the reforms, did not face the fundamental problems of which the best minds were already fully conscious—such problems as civil equality, civil and political liberty, constitutionalism, and popular control of, and participation in, government.

Far more effective than the action of the rulers, because of their moral and political inspiration, were the works of a number of Italian writers, particularly Giuseppe Parini (1729-1799) and Vittorio Alfieri (1749-1803). The former, by renewing Italian lyric poetry with his odes, became the interpreter and promoter of civil and moral ideals, and in his satirical poem *Il giorno*, by caricaturing the idle and pretentious nobility of the time, went beyond contemporary political reformism to develop a sense of social justice reflecting a philosophic and Christian consciousness. The latter, in his tragedies and other works, preached the hatred of all tyrannies, the love of liberty, and a sense of personal dignity.

FROM THE FRENCH REVOLUTION TO UNIFICATION

The Revolutionary-Napoleonic Period.—About 1790, the progressive reformism of the Italian governments was halted and there were signs of reaction. The events of the French Revolution, by frightening the rulers, caused the reactionary tendency to become permanent. At the same time, the new ideas influenced a restricted Italian circle, and Jacobin clubs were formed in a number of cities.

In 1792, Victor Amadeus III (r. 1773-1796), king of Sardinia, joined the First Coalition against revolutionary France and promptly lost Nice, Savoy, and part of Piedmont. Four years later, Napoleon Bonaparte, who commanded the French armies in Italy, defeated the Austrians at Millesimo, and the Piedmontese at Mondovì. Victor Amadeus was compelled to cede Savoy and Nice to France and to permit the establishment of French garrisons in the Piedmontese fortresses. Meanwhile, on May 10, 1796, Napoleon won the Battle of Lodi, and shortly thereafter controlled most of Lombardy. A strong movement for liberty, democracy, and unity developed in Lombardy and Emilia and spread to the rest of the peninsula. Under the protection of the French armies, a number of republics were formed—the Ligurian (1796); the Cisalpine (Lombardy and Emilia, 1797); the Roman (1798); and the Parthenopean (Naples, 1799). (See CISALPINE REPUBLIC; PARTHENOPEAN REPUBLIC.) A minority of cultivated noblemen and, to a greater extent, the middle class took part in this movement, but the people remained passive, if not hostile. Venice, which had also been transformed into a democratic republic, in 1796, was ceded by France to Austria in exchange for

Lombardy and the Belgian provinces under the terms of the Treaty of Campoformio (1797). In 1799, the French occupied Florence and forced the grand duke of Tuscany, Ferdinand III (r. 1790-1799), to flee.

In 1799, the Austro-Russian armies of the Second Coalition drove the French from Italy. There was a popular as well as a clerical and reactionary movement against the French and the Jacobins, and the latter were massacred in both Piedmont and Naples. The former rulers returned to their thrones. Within two years, however, Napoleon, now first consul of France, was once more in control of the peninsula, and the Treaty of Campoformio was confirmed by the new Treaty of Lunéville (Feb. 9, 1801), which further provided that Tuscany be ceded to Parma. In 1802, Piedmont was annexed to France, and King Charles Emmanuel IV (r. 1796-1802) abdicated in favor of his brother, Victor Emmanuel I (r. 1802-1821), whose kingdom had been reduced to the island of Sardinia. (French acquisition of Piedmont was confirmed in 1805 by the Treaty of Pressburg, by which France also received Parma and Tuscany.) In 1802 the Cisalpine Republic was renamed the Italian Republic, and, in 1805, the Kingdom of Italy, comprising Lombardy, Venetia (ceded by Austria under the Treaty of Pressburg), Emilia, and part of central Italy. Napoleon, who had become emperor of France in 1804, was now crowned king of Italy, Eugène de Beauharnais serving as his viceroy. The Ligurian Republic was annexed to France (1805). In 1806, Ferdinand I was driven from Naples by Joseph Bonaparte, who ruled until 1808, when he was succeeded by Joachim Murat. (Sicily continued to be ruled by the Bourbons.) Pope Pius VII (r. 1800-1823), with whom the Italian Republic had concluded a concordat in 1803, was deported from Rome in 1809, and the Papal States (except Marche, which became part of the Kingdom of Italy) were incorporated in France.

The Napoleonic government was a police regime serving an enlightened despotism. Italy was completely dependent upon France and French interests. Representative bodies, where they existed, had a fictitious life; political liberties were nonexistent. The administration of government, however, was almost entirely in the hands of Italians, who accomplished with revolutionary methods what the reformist movement of the 18th century had begun: the disappearance of feudal and economic bonds and of church privileges (*manomorta*, mortmain); the creation of regular and centralized administrations; and the establishment of uniform weights and measures. In addition, public instruction and hygiene were given due attention. With the suppression of customs and tariff barriers, industry and commerce received a new impulse. Great roads were built, public works were fostered, cities were enlarged, and progress was noticeable in industry and agriculture. Of no small importance was the organization of an army of the Kingdom of Italy. Foreigners created the army and commanded it, and it fought almost always for foreign interests. The officers and men were Italian, however, and the army provided them with technical training and gave them a focus of national sentiment. The very name Kingdom of Italy kept this sentiment alive. Nevertheless, the Napoleonic period represented on the whole a spiritual, and political retrogression when com-

pared with the ideals of liberty, democracy, and unity of the brief revolutionary years.

Restoration and Risorgimento.—In 1815, after the fall of the Napoleonic empire and the conclusion of the Congress of Vienna, the political and territorial condition of Italy resembled that of 1748, following the Treaty of Aix-La-Chapelle, but it was even less favorable to internal progress or to the development of national independence. The independent republics of Venice and Genoa had disappeared, and the Republic of Lucca was made into a Bourbon duchy under Maria Luisa of Parma, who served as regent for her son Charles Louis. The other states were reconstituted, the Kingdom of Sardinia receiving Liguria. Lombardy and Venetia were under Austrian control, and Austria became the dominant power in the peninsula, which was regarded as her sphere of influence by the other states in the Holy Alliance. Austrian sovereigns ruled in the Grand Duchy of Tuscany (Ferdinand III, restored in 1814, was succeeded by his son Leopold II, r. 1824-1859); in the Duchy of Modena (Francis IV of Este-Lorraine, who was succeeded by his son Francis V, r. 1846-1859); and in the Duchy of Parma, which, with Piacenza and Guastalla, was given to Marie Louise, wife of Napoleon and daughter of Emperor Francis I of Austria. The Kingdom of the Two Sicilies (Ferdinand returned to Naples in 1815; he was succeeded by his son Francis I, r. 1825-1830), was bound by a treaty to Austria. In Piedmont, the restored Victor Emmanuel I and the ruling class regarded Austria with hostility, or at least with suspicion, but were bound to her in the common conservative interest of opposing liberal movements. This interest also made the other Italian sovereigns dependent upon Austria. The Papal States were reconstituted by Pius VII, who returned from exile. (See also VIENNA, CONGRESS OF; HOLY ALLIANCE.)

The restoration of the old order probably went further in Italy than in any other European country. This was particularly true of Piedmont under Victor Emmanuel I. The Austrian provinces, Tuscany, and Naples preserved to some extent the traditions of 18th century and Napoleonic reformism. In these states also, however, there was a marked retrogression from the Napoleonic period, which had taken Europe by storm, brought new energies to the fore and new classes into public life, and maintained the principle of popular sovereignty in place of divine right. Restoration Italy appears reactionary even in comparison with the period of 18th century reformism. The reforms which had taken place before and during the Napoleonic period were maintained, when they were maintained, only through fear of social disturbances or as instruments of absolutism and as a barrier against further innovations—that is, in a conservative and reactionary spirit.

In contrast to the situation in the 18th century, the distance between the governments and progressive public opinion in restoration Italy was very great. Classical and medieval memories, the tradition of local autonomy, the teachings and the reforms of the 18th century, the recent revolutionary experience, all fostered liberal ideas. National sentiment, pride in the Italian people, who had created ancient Rome, and the present foreign oppression, all helped to increase the desire for independence and to develop the idea of a *risorgimento*, or rebirth. This

term had at first merely a literary and cultural significance, but later, after the writings of Vittorio Alfieri, assumed an ethical and political meaning. The conception of governmental unity, for which a united nation offered a solid basis, and to which the Napoleonic Kingdom of Italy had given an initial reality, was among the last to reappear. When it did reappear, it was rather timid and uncertain.

These ideas and sentiments were active in the minds of a chosen few. The nobility—with some exceptions in Lombardy—was largely uninterested, the clergy was almost entirely hostile, and the peasants knew nothing about them. National ideas found sympathy instead in the middle class, which was the most alert and most active part of the population, and which had suffered more than any other group from the reactionary ordinances of the restoration. The bureaucracy was in the hands of noblemen, church officials, and foreigners. Industry and commerce were hampered by customs barriers, weights and measures were no longer uniform, a suspicious vigilance was constantly exercised, and a number of aggravating rules were enforced. The administrative and judicial organizations were insufficient; cultural life was obstructed; and so was every form of activity with which the middle class, which had for some time grown and prospered in Italy, was concerned.

Although the Italian liberals and patriots constituted a minority, it was a larger and more varied one than is generally presumed. From the upper middle class, with a few noblemen, the movement extended rapidly to the artisans. The bravest and most impatient conspired through secret societies. Of the origins, bylaws, and programs of these societies, little is known with certainty. Probably they derived their common origin from Freemasonry, which in the revolutionary and Napoleonic period had spread widely in Italy. Chief among them was the Carbonari (q.v.), which seems to have absorbed others, such as the Gueffi (Guelphs) in Lombardy and Romagna, whose purpose was to promote Italian independence and to form a league among the various states, probably with the pope as president. The Carbonari advocated constitutional government and independence, but spoke neither of a republic nor of unity.

During the 15 years following the restoration, the Italian national movement was intimately connected with similar movements elsewhere in Europe, particularly in France. They all had common memories of the Revolutionary-Napoleonic period. Napoleon, deposed and exiled by the Holy Alliance, became a symbol of liberty. The armies were hotbeds of liberal movements. There was a common public opinion and state of mind in Europe, so that events in one country had immediate repercussions in others.

The revolution which broke out in Spain in January 1820 had its effect in Naples in July of the same year, with the insurrection of soldiers belonging to the Carbonari, led by Guglielmo Pepe, a former general in Murat's army. Ferdinand I granted a constitution, and a Parliament was assembled. Then the king, having left the country, accepted Austrian intervention, which the Congress of the Holy Alliance, meeting at Troppau and Laibach, had approved. Austrian troops easily scattered the constitutionalists (March 1821), and the absolute monarchy was restored.

As the revolution in Naples was ending, another one broke out in Piedmont. Here also the Carbonari had penetrated the army and had become a rallying point for all who were dissatisfied with the restoration. The movement supported the house of Savoy, but wanted Victor Emmanuel to establish a constitutional government and march against Austria, reviving the ancient Savoy aspiration for a union of Lombardy and Piedmont. Agreements had been made with the federalist Lombards and with the Carbonari in Romagna and Marche. The second in line to the throne, Prince Charles Albert of the Savoy-Carignan branch of the family, sympathized with the Carbonari and entered into negotiations with them. The revolution began on March 10. Victor Emmanuel abdicated in favor of his brother Charles Felix (r. 1821-1831). Charles Albert became regent and granted a constitution, but he was disavowed by the new king and left the country. The royal troops, with Austrian aid, defeated the constitutionalists near Novara, on April 8.

Neither the people nor the middle class took part in these revolutions, which were the work of officers and noblemen. Joint plans, organization, common sense, and constancy were lacking. The two movements had, however, demonstrated that ideas of liberty, independence, and even national unity were spreading without encountering great hostility among the majority of the population, and that the rulers alone, without Austrian support, were unable to prevent their success. Insurrections did not take place in Lombardy and Venetia, but the Carbonari conspired actively. Numerous arrests were made, and severe sentences of hard labor in the fortress of Spielberg in Brno (Brünn), Moravia, followed. The moral and material sufferings of the prisoners were revealed to Europe with the publication in 1832 of *Le mie prigioni* by Silvio Pellico; his simple and unembittered little book "was worse for Austria than a lost battle."

The Italian and French Carbonari were in touch with one another. When the latter shared in the successful revolution in Paris, in July 1830, and Louis Philippe had succeeded to the French throne, the Italian patriots, trusting in the principle of nonintervention which had been proclaimed by the new French government, revolted in Modena, Parma, and the Papal States (February 1831). In Bologna, an assembly declared the temporal power of the pope at an end, proclaimed the union of the liberated territory under the name United Italian Provinces, and drew up a provisional constitution. Austria, ignoring French opposition, intervened and re-established the former governments in March. New revolts later in the year were put down in January 1832. Louis Philippe sent troops to occupy Ancona. (The foreign troops were finally withdrawn in 1838.)

The failure of the revolution in central Italy caused the decline of the Carbonari and its affiliated societies. They were replaced by another secret society, Giovane Italia (Young Italy, q.v.), which was of an entirely different character. It was founded in 1831 by a young Genoese and former member of the Carbonari, Giuseppe Mazzini. He gave the society as its aim an insurrection of all the people of Italy, and as a program the establishment of a united republic, which was to make Italy, in the name of God and the people, the leader of a European

revolution for social, religious, and political reconstruction. The Young Europe movement was organized in 1834. The confederated nations of the movement were to serve a united and redeemed humanity, which was to progress toward a divine sublimation. The European importance of the Italian revolution and the unitarian idea, which were closely connected, found in Mazzini, for 40 years, an eloquent and tireless champion. By intimately associating the political program with moral renovation and the mission of serving all humanity, he brought the Italian Risorgimento to its greatest moral height and contributed more than anyone else to lending it universal significance.

Mazzini's propaganda was highly successful at first. Affiliated groups were organized all over Italy, particularly in the Kingdom of Sardinia. Charles Albert (r. 1831-1849), having discovered the diffusion of Giovane Italia in the ranks of the army, undertook very severe measures of repression in 1833. An attempt to invade Savoy from Switzerland, in February 1834, failed, and the movement declined for several years. Around 1840, Mazzini revived the work of Giovane Italia, this time from London, with a center of organization and propaganda in Paris. Other uprisings took place, particularly in Romagna and the Kingdom of the Two Sicilies. The expedition of Attilio and Emilio Bandiera in Calabria, in 1844, ended in their execution and that of their comrades.

The failure of these insurrections favored the development of a moderate liberal party which would endeavor to obtain from the existing governments political reforms and an Italian confederation. It was hoped that these reforms would be the first step toward Italian independence. The latter, the moderates thought, might be obtained at a later date, either through war with Austria, or through an agreement whereby Austria would renounce Lombardy and Venetia in exchange for territorial compensation in eastern Europe. One group of the moderate party, called the Neo-Guelphs, attributed great importance to an agreement with the pope, who they thought should be the head of the proposed confederation. Its most authoritative spokesman, Vincenzo Gioberti, demanded in *Del primato morale e civile degli italiani*, published in 1843, that the moral direction of the national movement be assumed by the papacy. Other distinguished writers among the moderates were Cesare Balbo (*Delle speranze d'Italia*, 1843); Massimo d'Azeglio (*Ultimi casi di Romagna*, 1846); and Niccolò Tommaseo.

The writings of these moderates are part of the general picture of Italian literature during the first half of the 19th century, all or mostly all of which had a patriotic, or at least a moral and civic, character. The romantic movement, which came to Italy by way of Germany and France—and of which the greatest Italian representative was Alessandro Manzoni (1785-1873), author of the *I promessi sposi*—made an essential contribution to patriotic writing. Other writers, democrats and republicans, played an important part in this civic literature. Besides Mazzini, there were Carlo Cattaneo (1801-1869) and Giuseppe Ferrari (1812-1876), who advocated radical liberalism and a federalist, republican organization of Italy. To the political writers and poets like Manzoni, Giovanni Berchet (1783-1851), and Giovanni Prati (1815-

1884), we may add historians such as Balbo, Carlo Troya (1784-1858), and Michele Amari (1806-1889), all of whom fostered patriotism by recalling Italy's past. Reviews like *Il Conciliatore* and *Antologia* made use of literature for the same purpose.

This political, historical, and literary production lent to the political movement of the Risorgimento an idealistic foundation such as few political movements have ever had. Only the strength of these spiritual currents can explain the proportions which the Italian popular movement suddenly assumed in 1846-1848, and the fact that after an initial failure it began again and moved rapidly toward its final, overwhelming success. (See also section on *Literature*.)

The election of Pope Pius IX (r. 1846-1878) seemed to favor the success of the liberal-moderate program. The pope proclaimed a broad political amnesty and initiated reforms which were imitated first by Leopold II of Tuscany, and later by Charles Albert. These reforms—greater press freedom and the institution of a civil guard and of administrative and consultative bodies—were accompanied by popular manifestations of great enthusiasm, systematically organized. These manifestations were evidence of the return of the Italian people to public life, from which they had been excluded by centuries of servitude and passivity.

An anti-Bourbon revolution, victorious in Sicily in January 1848, created a strong liberal movement in Naples. On February 10, King Ferdinand II (r. 1830-1859) granted a constitution to his subjects. Similar constitutions were introduced by the rulers of Tuscany (February 17) and Sardinia (March 4), and by the pope (March 14). (In 1847, Tuscany had purchased Lucca from Charles Louis, who had succeeded to the throne of Parma as Duke Charles II upon the death of Marie Louise.) At the same time, the French revolution of February 1848, which replaced the house of Bourbon-Orléans with a republic, spread to Germany, Austria, and Italy. The people of Milan arose in the "five days" (March 18-22) and drove out the Austrians. Venice followed their example and proclaimed a republic on March 22. Charles Albert, on whom the Lombard moderates had called for aid, declared war on Austria on March 23 and adopted the three-colored flag inherited from the revolutionary movements of 1796-1797. Tuscan, Roman, and Neapolitan troops took the field against the Austrians. Lombardy and Venetia voted to unite with Piedmont and to recreate a kingdom of northern Italy.

After a few initial successes, Charles Albert was defeated by the Austrians in the Battle of Custoza (July 23-25), and was obliged to conclude, on August 9, the Armistice of Salasco and withdraw beyond the Ticino River. The other rulers abandoned the cause of national independence. Previously, on April 29, the pope had declared that he could not participate in the war because of his position as the head of all Roman Catholics. This statement pointed up the incompatibility between the positions of head of the church and national sovereign and meant the end of the Neo-Guelph movement. The democratic movement gained the ascendancy, particularly after Pope Pius and Leopold II had left their states (in November 1848 and February 1849, respectively). On Feb. 9, 1849, a constituent assembly proclaimed a republic in Rome,

which Tuscany joined. Giuseppe Mazzini was placed at the head of a governing triumvirate, which also included Aurelio Saffi and Carlo Armellini. The Catholic powers—Naples, Spain, Austria, and France—intervened on behalf of the pope. A French army commanded by Gen. Nicolas Oudinot besieged Rome, which, after a heroic resistance led by Giuseppe Garibaldi, was forced to capitulate (June 30). The Austrians re-established papal sovereignty in the provinces of Bologna and Romagna, and in Marche and Umbria. An Austrian garrison was established in the legations, and a French garrison in Rome. On July 17, the pope revoked the constitution. Meanwhile, the dukes of Modena and Parma (Charles II, who had abdicated, was succeeded by Charles III, r. 1849–1854) were restored, and in May 1849, Leopold II was reinstated in Tuscany by the Austrians. (The Tuscan constitution was abolished in 1852.) Ferdinand II abolished the constitution of Naples in 1848, and, in May 1849, reconquered Sicily by bombardments which earned him the name King Bomba.

On March 12, 1849, Charles Albert again declared war on Austria, but was defeated at Novara on March 23 and immediately abdicated in favor of his son, Victor Emmanuel II. The new king made peace with Austria on August 9, but remained faithful to the constitution and to the national cause. Exiled patriots from every part of Italy made Turin, the capital of Piedmont, their meeting place. See also biographies of important figures.

The Unification of Italy.—The federalism of the moderates lost ground after the catastrophes of 1849, and the advocates of a united Italy gained support. Of the two principal groups of Italian patriots, the republican-Mazzinian and the Savoy-monarchist, the latter was less unitarian than the former and was prepared, if necessary, to accept a compromise between federalism and unity. Mazzini, although he did not reject the contribution of the house of Savoy, believed that the secret conspiracies and popular insurrections should be continued. From Lausanne and London he directed his followers in Italy, as in the abortive revolts of Mantova (Mantua) in 1852, and Milan in 1853. Although Mazzini's enterprises all failed, they were not useless to the national cause. They kept alive the spirit of resistance and hatred of Austria, which was aggravated by the repressive government of the Austrian officials, and by such actions as the execution, in 1853, of five patriots, called the martyrs of Belfiore. The Mazzinians also spread the idea of unity and counteracted the propaganda in southern Italy for a separate kingdom under Prince Napoléon Murat, son of Joachim, by means of the expedition of Carlo Pisacane to Sapri, Campania, in 1857. Finally, they offered an excellent means of presenting the national cause to the other countries of Europe.

From November 1852 to July 1859, Count Camillo Benso di Cavour was prime minister of the Kingdom of Sardinia. He believed that progress could be made by constitutional means and that groups of different political tendencies could work together in harmony. Himself the leader of the Right Center wing of the Piedmontese Liberal Party, he formed his government with the support of Urbano Rattazzi, leader of the Left Center. Cavour's was a career of manifold and indefatigable activity.

His subtle and resourceful mind was always ready to make the best of every situation and to adapt itself to any circumstance. Before he took office, the ecclesiastical courts had been abolished, and the right of religious bodies to acquire real property had been restricted (April 1850); now, in 1855, all religious orders which were not engaged in preaching or educational and charitable activities were abolished—that is, deprived of their juridical personality. The conservative Catholic element was strongly opposed to these measures, and a conflict with the papacy ensued.

With regard to Italian aspirations, Cavour acted with prudence and adroitness. He made the liberals of the peninsula understand that they must rest their hopes in Piedmont. At the same time, he abstained from provoking Austria. He did, however, react to an Austrian provocation in 1853 by recalling the Piedmontese ambassador. It was Cavour's aim to place Piedmont at the head of the national movement which was endeavoring to form at least a kingdom of northern Italy. But he wanted the initiative to be taken by the government of Piedmont, and thereby assure the preservation of the monarchy and of bourgeois-liberal constitutionalism. He counted on the support of France and Great Britain, and particularly on Napoleon III's interest in Italy. (Mazzini, on the other hand, was bitterly opposed to an alliance with a foreign and illiberal monarch.) In the meantime, Cavour endeavored to take advantage of Piedmont's participation in the Crimean War on the side of the Western powers. Although the Congress of Paris at the close of the war (1856) did not bring Italy tangible results, Piedmontese prestige was increased, relations with France became more intimate, and Russia was approached at a moment in which she was hostile to Austria, which was also losing the support of Prussia.

At this time, a fusion of the monarchists with a majority of the republicans took place through the agency of the Società Nazionale, which was founded in 1857 by Daniele Manin (president of the Venetian Republic in 1848–1849), with the assistance of Giuseppe La Farina and Giorgio Guido Pallavicino-Trivulzio and the secret support of Cavour. The society accepted the house of Savoy on the condition that it favor Italian unity and independence. Garibaldi adhered to its program; Mazzini did not.

In July 1858, Napoleon III and Cavour made a secret agreement at Plombières, which was ratified by a formal treaty in January 1859. It provided that Napoleon would join Piedmont in a war against Austria, that an Upper Italian Kingdom would be formed, and that France would receive Nice and Savoy. War followed (April 29, 1859), and the Austrians were defeated at Magenta (June 4) and Solferino (June 24). In May, there were peaceful revolutions in Tuscany, Parma, and Modena, with the flight of their rulers (Leopold II; Robert, r. 1854–1860; and Francis V), and in June, there were revolts in the legations. Napoleon, frightened by these revolts and by the cost of the war, made a separate armistice with Emperor Francis Joseph of Austria on July 8. The two emperors met at Villafranca on July 11 and agreed that Austria should retain Venetia, but that Lombardy, with the exception of Mantova and Peschiera, should be ceded to France, which would turn it over to Piedmont. The rulers of Tuscany and Modena should return, but without external force. (These terms

were confirmed by the Treaty of Zurich, on November 10.) Victor Emmanuel accepted the Austrian retention of Venetia, and Cavour resigned. Meanwhile, assemblies in the three duchies and Romagna had voted for union with Piedmont. Cavour, who returned to office in January, entered into diplomatic negotiations with Napoleon III, with a view to annexing this territory. In March, plebiscites were held in the four areas, all of which voted to join the Kingdom of Sardinia. By way of compensation, Sardinia ceded the provinces of Nice and Savoy to France (Treaty of Turin, March 24), subject to a referendum, which was held in April and resulted in approval of the acquisition of these two areas by France.

From this moment, the making of a united Italy progressed rapidly. The expedition of the One Thousand, headed by Garibaldi, overthrew the Bourbon government in Sicily (May 27, 1860) and Naples (September 7) with the program "Italy and Victor Emmanuel." King Francis II (r. 1859–1861) fled to Gaeta. In order to overcome the last Bourbon resistance, and assume once more the direction of the movement, the Piedmontese government occupied Marche and Umbria (September 1860), detaching them from the Papal States. Following favorable popular referendums in all these states (Naples and Sicily, October 1860; Marche and Umbria, November 1860), Victor Emmanuel II, on March 17, 1861, assumed the title of king of Italy by means of a law voted by the first national Italian Parliament, which met in Turin on February 18.

The collaboration between the Action Party (democratic-republican movement) and the liberal monarchist government of Piedmont was accepted by Mazzini, who set his republican program aside. He intended, however, that the Italian people should be consulted and allowed, freely, directly, and integrally, to choose their form of government; he demanded that a national covenant be drawn up by a constituent assembly. Moreover, the wing of the Action Party which did not follow Mazzini and was grouped around Garibaldi would not wait for the government to take the initiative in liberating Venetia and Rome, and repeatedly acted of its own accord. Out of this situation arose the Battle of Aspromonte (Aug. 29, 1862) between the royal troops and Garibaldi, who wanted to march on Rome. Garibaldi himself was taken prisoner, but was freed by an amnesty on October 5.

On March 27, 1861, Rome had been proclaimed the capital of Italy, on the initiative of Cavour, who also endeavored to have Pope Pius IX renounce temporal power in exchange for full liberty for the church in ecclesiastical affairs, according to the principle of a "free church in a free state," which Cavour believed would mean a renovation of the Catholic world. His efforts having failed, he entered into negotiations with France. Because of his early death (June 6, 1861), the negotiations were continued by others and resulted in the September Convention (Sept. 15, 1864), whereby Italy pledged herself not to attack, or to allow attacks on, the Papal States. France in exchange would withdraw her troops within two years from February 1865. Following the convention, the capital was moved from Turin to Florence (1865). Hopes centered on a Roman insurrection, once the French troops had departed (December 1866), but this did not

occur, not even after Garibaldi had almost reached Rome with an army of volunteers in October 1867. Instead, Napoleon III sent back his troops, Garibaldi was defeated at Mentana (November 3), and the French once more garrisoned Rome.

In order to acquire Venetia, the Italian government, encouraged by Napoleon III, entered into an alliance with Prussia against Austria (April 8, 1866). The Austro-Prussian War, which began in June, was entirely successful for the Prussians, while the Italians were defeated by the Austrians on land at Custoza (June 24), and at sea near Lissa (July 20). They resumed the offensive with a considerable army, but were halted by a truce signed between Austria and Prussia (July 26). The Treaty of Vienna (Oct. 3, 1866) sanctioned the cession to Italy of Venetia, which Austria had ceded to France in July. However, the Italian claims to Trentino, Trieste, and Istria had to be abandoned. A plebiscite, held on October 21–22, approved the acquisition of Venetia by an overwhelming majority.

At the beginning of the Franco-Prussian War (July 1870), France began the withdrawal of her garrison from the Rome area, completing the removal of troops by August 19. Urged on by the Left-wing parliamentary parties, and by the Action Party, the Italian government sent an expedition which occupied Rome on September 20. After a plebiscite (overwhelmingly in favor of union with Italy), the annexation of Rome was effected on October 2, and the city became the capital of Italy. The pope's situation was regulated by the Law of Guarantees (May 13, 1871), which gave the pontiff sovereign honors, as well as extraterritorial privileges in the Vatican and Lateran and the summer residence of Castel Gondolfo. A yearly income was assigned to him, and he was to have complete liberty in the exercise of his spiritual ministry. The state renounced all interference in the life of the church, but maintained the exequatur and placet for the destination of ecclesiastical property and the provision of major and minor benefices. The pope did not accept the law, and, considering that he was "placed under hostile domination," shut himself in the Vatican. MODERN ITALY

The history of modern Italy may be divided into three major periods: the post-Risorgimento period (1870–1919), in which the country was a liberal monarchy; the period of the rise and fall of fascism and World War II (1919–1945); and the postwar period.

The Post-Risorgimento Period.—With the acquisition of Rome, a national and united Italian state had come into being for the first time in history. The new state was a constitutional monarchy. The king was empowered to nominate and remove his ministers, but it became constitutional practice for him to follow the wishes of Parliament in the choice of the prime minister, in the approval of the list of Cabinet ministers submitted by him, and in the retention or dismissal of the Cabinet. Notwithstanding the respect of the crown for parliamentary suggestions, however, Italy did not have a completely parliamentary government of the British type, with a regular two-party alternative, because

parties and parliamentary groups in Italy were far more numerous and less clearly defined than in Great Britain. Therefore, the king had more initiative in the choice of a government.

In any case, during the first 10 years after the union of Rome with Italy, the division between Right and Left was in practice definite enough to make the formation of a government fairly simple. The Right was substantially a continuation of the government party created by Cavour. It favored restricted suffrage, with a certain tendency to oligarchy and a diffidence in regard to democracy and the popular masses. It believed in the idea of a strong state directing national political life, though respecting existing laws and individual liberty. The Left represented the fusion or mingling of the groups which had opposed Cavour and his successors. While it supported a constitutional monarchy, it had not lost contact with the extreme and tentatively republican elements and showed on the whole a more popular character and a more democratic tendency than the Right. The Left favored an extension of the suffrage and greater freedom in political manifestations. On the margin of this constitutional Left (led by Urbano Rattazzi from 1870 until his death in 1873, then by Agostino Depretis), more radical and republican elements found their place. The pure or Mazzinian republicans remained outside Parliament (Mazzini himself died in March 1872).

The organization of the new state from 1860 to 1873 was accomplished largely by the Right. In order to insure independence and unity, it favored centralization, excluding not only federalism, but also local autonomy. Municipal and provincial administrative elections were held (city mayors were for a long time appointed by the king), but the elected officials had limited powers, and were under the strict control of the prefects. Difficult and tremendous was the government's task in restoring state finances, developing railroads and other public works, and organizing the army and navy.

This program, whereby Italy with notable speed and efficiency approached the status of other major European states, was continued by the Left, which came into power in March 1876. In the 15-year period between 1876 and 1891, elementary education was made compulsory and free (1877); the suffrage was extended from 600,000 to about 3,000,000 persons; railway conventions were signed (1885); landed property was taxed according to its value; communal and provincial administration was reformed; a new penal code was published (1888); the number of army corps was increased from 10 to 12 (1882); and great battleships were built.

During the first years of the government of the Left, Humbert I succeeded Victor Emmanuel II (d. Jan. 9, 1878), and Pope Pius IX (d. Feb. 7, 1878) was followed by Leo XIII. The latter took a firm stand with regard to temporal power, but his language was more moderate than that of his predecessor and for some years he may even have thought of a reconciliation with the Italian government. In any event, Vatican policy was directed toward the restoration of temporal power, and the support first of Germany and then of France was vainly sought. The Leftists continued substantially the ecclesiastical policy of the Right respecting religious freedom and the pope's spiritual independence. At times, however, they displayed weakness in handling the

outbursts of anticlericals, who in turn accused the clericals of provocation. Catholics, on orders from the Vatican, abstained from participation in the political life of Italy.

The Left broke up into various groups which had in part a personal rather than a political character. From 1876 to 1881, Depretis and Benedetto Cairoli governed successively and then formed a Cabinet together; from 1881 to 1887, Depretis remained alone at the head of the government. He introduced a policy known as transformism, which meant the contact and combination in parliamentary majorities and in the Cabinet of elements belonging to the two original parties. But the leadership and the majority of Cabinet appointments remained with the Left, while a section of the Left (especially the so-called Pentarchy, consisting of Cairoli, Giovanni Nicotera, Francesco Crispi, Giuseppe Zanardelli, and Alfredo Baccarini) went into opposition against their former leader.

From the death of Depretis in 1887 until 1896, Crispi was the leading political figure, serving as prime minister in 1887-1891 and 1893-1896, and he continued the policy of transformism. Besides fostering parliamentary expediency, transformism served to unite the conservative elements in defense of the monarchy, for which French influence and the propaganda of the Irredentists for the annexation of Trentino and Trieste (conducted mainly by republicans) were considered dangerous. Against the eventuality of a French attack, Italy concluded, on May 20, 1882, the Triple Alliance (q.v.) with the two authoritarian states of Austria-Hungary and Germany, allied since 1879. The alliance was motivated in part by the French occupation of Tunisia (May 1881), which had a large and prosperous Italian colony.

The alliance was renewed in 1887 (and again in 1891) with better terms for Italy, which received guarantees of German support if the French attempted to move on Tripoli, and guarantees of compensation if Austria advanced in the Balkans. Crispi's foreign policy resulted in tension between France and Italy accompanied by a tariff war. Crispi gave a vigorous impulse to Italian colonial settlement in Eritrea and Italian Somaliland, which were acquired between 1882 and 1890. This African expansion, for which an organic plan and sufficient means were lacking, brought about a conflict with Ethiopia. Italy's defeat at Adua (Adowa) caused Crispi's dismissal (March 1896). He had already been attacked because of his megalomania and his dictatorial and illiberal policy—he dissolved the Socialist Party in 1894—as well as for personal reasons. On Oct. 26, 1896, Italy recognized the independence of Ethiopia by the Treaty of Addis Ababa. (See also ETHIOPIA.)

Under Antonio Starrabba, marchese di Rudini (the leader of the Right, but supported by the Left), an uncertain period followed. It ended with the bread riots of May 1898, which were severely repressed, and in the reactionary policy attempted by the ministry of Luigi Pelloux (1898-1900). Pelloux met resistance from the Extreme Left, and also the Constitutional Left headed by Zanardelli and Giovanni Giolitti.

Following the death of King Humbert I, who was killed by an anarchist on July 29, 1900, the new king, Victor Emmanuel III, called Zanardelli to office (March 1901). This was the beginning of the kingdom's most prosperous period.

The new government adopted a liberal policy in domestic affairs and received extreme Leftist support in Parliament, especially in matters concerning labor organizations. These were allowed to organize and act freely within legal limits, while the government maintained an impartial stand in the conflict between capital and labor. The epidemic of strikes which followed (1901–1902) brought about a better standard of living for the working class, while it did not arrest the full development of Italian economy.

Agriculture flourished following vast land reclamations undertaken through private initiative, production increased, and specialized farming was developed. Income from agriculture advanced from around 3,000,000,000 gold lire in the first years of the kingdom to 8,000,000,000 lire after 1900. The metallurgical industries grew (they were, however, overprotected by tariffs, a matter of serious dispute in the economic field), as did the mechanical and rubber industries, silk production, textiles (from 27,000 looms in 1882 to 78,000 in 1902), sugar refineries, and the production of fertilizers. The electrification of industry made great strides. Joint stock company capital rose from 846,000,000 lire in 1898 to 1,500,000,000 lire in 1903. Foreign trade, which had increased from approximately 2,000,000,000 to 3,000,000,000 lire between 1890 and 1900, reached 5,326,000,000 in 1910. Although the trade balance showed a deficit, this was canceled by the 470,000,000 lire remitted by emigrants and the 450,000,000 lire brought in by foreign tourists (1910 figures). Emigration increased steadily, but a good portion of it was temporary, and the emigrants, in addition to remitting large sums of money, often, especially in the south, returned and invested their savings in land purchases. The budget of 1897–1898 showed the first of a series of surpluses which continued until 1911–1912. The quotations on the public debt rose above par, preparing for the conversion from 4 per cent to 3.75 per cent, which took place in 1906, and for the subsequent conversion to 3.5 per cent. Italian paper money sold at a premium over gold.

Italy's economic progress as a united state was accompanied by manifold and impressive cultural accomplishments. During the second half of the 19th century, literary production was less forceful and original than in the first half, but showed greater variety and was more widely spread, bringing Italy into closer relation with the culture of other European countries. In narrative prose, Giovanni Verga (1840–1922), Antonio Fogazzaro (1842–1911), and Edmondo De Amicis (1846–1908) occupied distinguished places, but the forceful social organism represented by the French novel and even more by the French theater did not have its counterpart in Italy. On the other hand, Italy, as in the past, produced a great isolated personality in the poet Giosuè Carducci (1835–1907), who, besides inheriting the Italian literary tradition, was well versed in foreign philology. Classical in form and conception, his work echoed modern romanticism. Toward the end of the century, the leading place in Italian literature passed to Gabriele D'Annunzio (1863–1938), poet, novelist, and dramatist of European fame and influence. Second to him in influence was Giovanni Pascoli (1855–1912), a poet who, though imperfect in form, echoed new voices celebrating the love of nature and the human soul. The field of philosophical and historical writing

was extremely active, capped by the intense and manifold work of Benedetto Croce (1866–1952). (See also section on *Literature*.)

In the political field, the beginning of the 20th century belonged to Giolitti: he was at the head of the government in 1903–1905, 1906–1909, and 1911–1914. The great majorities which he won in the elections of 1904 and 1909 included the votes of conservatives, liberals, and radicals, so that transformism was again a valid expedient. Giolitti's policy, with all its opportunism, was substantially liberal, but it did not further the formation of organic political parties. The Socialists generally supported his social policy, but declined to take part in the government and split into various factions, among them the revolutionary syndicalists. At the other extreme stood the new Nationalist Party, which was frankly anti-liberal and imperialistic. In this period, for the first time, Catholics shared in the country's political life, supporting the moderates in the elections, and in 1909 a few of them entered Parliament. With the electoral reform of 1912, Giolitti introduced almost universal male suffrage, increasing the electorate from about 3,000,000 to more than 8,000,000.

In foreign policy, Italy steered a somewhat different course, beginning with the downfall of the Crispi ministry in 1896. The Triple Alliance was maintained—it was renewed twice, in 1902 and 1912—but merely as a defensive instrument (particularly with regard to Austria), and the friendship of France was sought. According to an agreement signed in December 1900, France renounced any interest in Tripoli, and Italy in turn held France free to act in Morocco. Later, in 1902, France and Italy reached an agreement whereby the two countries would maintain reciprocal neutrality in case of aggression. Meanwhile, Italy endeavored to halt Austrian expansion in the Balkans. Relations with Austria became strained, the Irredentist movement was once more active, and, in October 1909, the Raconigi agreement with Russia was signed (it provided that both countries would endeavor to maintain the status quo in the Balkans, and that Russia would not oppose Italy's attempt to acquire Tripoli). Through the Italo-Turkish War (1911–1912), Italy was able to annex Libya (Tripoli and Cyrenaica).

When World War I began in July 1914, Italy proclaimed her neutrality (August 3), stating that she was not bound by the Triple Alliance because Austria was an aggressor. She did, however, enter into negotiations with Austria in an attempt to obtain some compensation for Austrian acquisitions in the Balkans. When the Austrian concessions in this regard proved insufficient, Italy turned to the Allies and concluded with them the secret Treaty of London (April 26, 1915). On May 3, Italy denounced the Triple Alliance, and, after a crisis caused by the conflict between the supporters of neutrality (including Giolitti) and of intervention—the so-called *giornate di maggio* (May days)—declared war on Austria-Hungary (May 23, 1915), to take effect on May 24, 1915. Later, on Aug. 27, 1916, Italy also declared war on Germany.

Because of the strategically poor frontier she had inherited from the settlements of 1866, Italy entered the war under difficult conditions, and, in two years, her armies made a net advance of only 10 miles (11 battles of the Isonzo). The Italian Army ended, as Russian resistance was collaps-

ing, by sustaining the entire shock of the Austrian Army augmented by German divisions. Defeated at Caporetto (now Kobarid), on Oct. 24–Nov. 5, 1917, the Italians held firm on the Piave, repulsed a new offensive in June 1918, and finally won a substantial victory at Vittorio Veneto (Oct. 24–Nov. 4, 1918) while the Austro-Hungarian empire broke apart. (See also WORLD WAR I—9. *Italian Front*.)

By the Treaty of Saint-Germain (Sept. 10, 1919), Trentino and Alto Adige (South Tirol) were ceded to Italy. Decisions concerning the frontier with the new state of Yugoslavia (then called the Kingdom of the Serbs, Croats, and Slovenes) were the occasion for bitter controversies concerning Istria, the port of Fiume (now Rijeka), and Dalmatia. The Treaty of Rapallo, concluded directly with Yugoslavia on Nov. 12, 1920, gave Italy all of Istria to the natural Alpine frontier, while Yugoslavia received all of Dalmatia except Zara (now Zadar). Fiume, which had been seized in September 1919 by Gabriele D'Annunzio, was made a free state, but on Jan. 27, 1924, by agreement with Yugoslavia, the city was annexed to Italy. In the general settlements decided at the peace conference in Paris, Italy had little influence; she did not receive any mandates over former German colonies, and only some years later received a modest enlargement of her African colonies (Somaliland, 1925; Libya, 1919 and 1935).

See also WORLD WAR I—15. *Diplomatic History of the War*; 16. *The Postwar World*.

The Rise and Fall of Fascism.—The crisis of May 1915 had put an end to Giolitti's policy of progressive transformism. The war and the disappointments of the peace settlements produced a dangerous state of unrest in Italy, which was aggravated by the propaganda of extremists. The elections of November 1919—the first held with universal male suffrage and proportional representation, and with the last papal ban on Catholic participation lifted—resulted in a victory for the Socialists (156 deputies) and the Populists (Christian Democrats, 101 deputies). The Socialists, who included a wide range of political opinion (the Communists broke away in 1921), supported a series of strikes which culminated in a temporary occupation of industrial plants by the workers (September 1920), and refused to take part in the government though they were the largest party. The Populists, who had attracted a large part of the liberal and conservative votes, followed a middle-of-the-road policy with scant success. New elections, held in May 1921, resulted in 157 seats for the Liberal Center, 108 for the Populists, 123 for the Socialists, 15 for the Communists, and 22 for the Fascists (actually elected in a joint list with the Liberals).

The Fascists, led by a former revolutionary Socialist, Benito Mussolini, found their support in groups without political consciousness, who lacked class feeling and belonged to no political party. They exploited a number of different sentiments and interests, especially the nationalism of the lower middle classes (misled by the nationalistic slogan of a "mutilated" or "betrayed" victory) and the fear of bolshevism on the part of the wealthy. Fascism, aided by the inertia or complicity of the leading classes, fought its opponents with the systematic violence of *squadismo* (squadism, or the use of armed groups to silence opponents), and in the end attempted to seize power by the march on Rome (Oct. 28,

1922). This gesture had little consistency and would have failed had not King Victor Emmanuel refused to proclaim martial law, and, on October 28, sent for Mussolini and commissioned him to form a government.

Mussolini at first maintained a show of constitutional government, although broad use was made of pressure, intimidation, and violence. He was granted dictatorial powers, and, in November 1923, forced a new electoral law through Parliament, providing that the party receiving the largest number of votes would be given two thirds of the seats, which the Fascists received after the election of April 1924. After the murder of Giacomo Matteotti secretary of the United Socialist Party and deputy (June 10, 1924), and the passive anti-Fascist reaction called the Aventine secession (whereby the majority of the non-Fascist third of Parliament abstained, protesting the illegality of the regime—their seats were finally declared vacant in 1926), the Fascists, by means of state and party power, broke the opposition of the remaining political parties and organized a totalitarian state. The Chamber of Deputies, which had first been rendered subservient to fascism, was later, in 1938, replaced by the Chamber of Fasci and Corporations, whose members were appointed by the council of the Fascist Party and the National Council of Corporations. Individual liberty was suppressed, justice was made dependent upon political power, party privilege replaced equal rights among citizens, and the national economy was exploited by profiteers. Italian culture was used for party purposes and vitiated by the spread of gross and inconsistent theories in marked contrast to the fundamental humanistic outlook of modern Italy.

The crown was a necessary accomplice in this work of destruction, because it gave fascism a free hand and repeatedly expressed spontaneous approval of Fascist policy. The upper middle class, especially the so-called plutocracy, also offered the regime its support. In addition, fascism was strengthened by the Lateran Treaty (Feb. 11, 1929), and the Concordat of 1929, by which Pope Pius XI and Mussolini settled the Roman question by creating Vatican City, and by the signing of a concordat favorable to the Holy See.

Fascist foreign policy encouraged nationalist and imperialist aspirations. It supported revision of peace treaties, showed hostility to France and to the League of Nations, and defied the latter by invading Ethiopia (Oct. 3, 1935). Sanctions imposed by the League were ineffectual, Ethiopia was conquered, and, on May 9, 1936, Victor Emmanuel assumed the title of emperor of Ethiopia. Following these events, Italy announced her withdrawal from the League of Nations, in December 1937. On April 7, 1939, Italy invaded Albania, which was rapidly conquered, and five days later, Victor Emmanuel became king of Albania. Mussolini had bound himself to Nazi Germany in October 1936 (Rome-Berlin Axis). He was supported by Adolf Hitler in his policy of intervention in support of Gen. Francisco Franco in the Spanish Civil War, and in his turn he supported Hitler in the German annexation of Austria (March 1938) and of the Sudetenland (September 1938), and in the occupation of Bohemia and Moravia (March 1939), and finally he concluded with Germany a defensive and offensive alliance (May 22, 1939).

At the outbreak of World War II, in Sep-

tember 1939, Mussolini proclaimed Italian nonbelligerence. Then, during the invasion of France, on June 10, 1940, he drew Italy into the war against France and Great Britain; on June 22, 1941, against Russia; and, finally, on Dec. 11, 1941, against the United States. After some initial successes in North and East Africa, Italy underwent a series of reverses, on land, with the loss of all her colonies; on the sea, with the destruction of most of her fleet; and in the air. The general discontent among the Italian people against war and fascism brought about a series of strikes and far-reaching conspiracies among old and new political parties, which formed a clandestine anti-Fascist alliance.

On July 25, 1943, the king dismissed Mussolini and formed a Cabinet of crown dictatorship led by Marshal Pietro Badoglio. An armistice was concluded with the Allies on September 3, but the Germans, who had been permitted to enter Italy in considerable numbers, took possession of northern and central Italy, and Mussolini organized the Republican Fascist Party (September 15) and proclaimed a "social republic" in the north.

Italy declared war on Germany on Oct. 13, 1943, and was recognized by the Allies as a co-belligerent. She took part in the war with regular armed forces, and, to an even greater extent, with partisan action behind the enemy lines. The fighting continued until April 1945, when the country was entirely liberated.

Postwar Italy.—In the political sphere, a beginning had been made to shift control from military to civilian authorities soon after the liberation of Rome. On June 9, 1944, Ivanoe Bonomi formed a coalition Cabinet of anti-Fascist parties; he was replaced on June 17, 1945, by Ferruccio Parri, who himself was forced out on November 24 by Anglo-American pressure. The leader of the Christian Democratic Party, Alcide de Gasperi (1881-1954), then formed his first Cabinet on December 10. The national elections of June 2, 1946, replaced the monarchy with a republic (established June 10) and gave the Christian Democrats a leading position in the new Constituent Assembly. Earlier, on May 9, King Victor Emmanuel III (1869-1947) had abdicated in favor of his son, but the reign of Humbert II was brief and he joined his father in exile after the elections. De Gasperi, a staunch anti-Communist, provided Italy with its strongest postwar government, presiding for more than eight years over a series of coalitions, and steadfastly pursuing a policy of close cooperation with the West. In the critical elections of April 1948 (the first held under Italy's republican constitution, effective January 1), he was established firmly in power by a decisive victory over the Communists; and on May 11, Parliament selected Luigi Einaudi as first constitutional president.

In the field of international relations, the main postwar problem of Italy was that of its adjustment to the conditions created by the peace treaty of Feb. 10, 1947. The treaty's provisions included the surrender of Istria to Yugoslavia (except for the Free City of Trieste), the renunciation of all titles to the African colonies, and reparations payments totaling \$360,000,000 to the Soviet Union, Greece, Ethiopia, and Albania. Other clauses severely limited land, naval, and air forces. These provisions were substantially mitigated and in many ways obliterated by subsequent developments which led to Italy's participation in the Marshall Plan (June 1947),

the North Atlantic Pact (April 4, 1949), the Council of Europe (May 5, 1949), and the Western European Union (October 1954). The Trieste (q.v.) problem was solved by an agreement signed in London on Oct. 5, 1954. Italy was admitted to the United Nations on Dec. 14, 1955, and became a founding member of the European Economic Community (Common Market) in 1957. In succeeding years the Italian government favored expansion of the Common Market and greater European political unity.

The political situation in Italy was often chaotic in the 1950's and 1960's. Italy's multi-party system prevented any party from securing a majority in parliament. As a result the Christian Democrats, in ascendancy since 1945, sought alliances with other center and left-center groups to form coalition governments. Their efforts were complicated by their division into right and left wings and by the large Communist Party vote in parliament.

De Gasperi's government fell in 1953. Christian Democratic premiers rapidly succeeded one another thereafter. Governmental crises were even more frequent than the rotation of premiers indicates. Often the premier had to form several different cabinets during his term in office. There were periods with no cabinet at all and periods with temporary "caretaker governments."

POSTWAR PREMIERS OF ITALY

Alcide de Gasperi	Dec. 1945 to Aug. 1953
Giuseppe Pella	Aug. 1953 to Jan. 1954
Amintore Fanfani	Jan. 1954 to Feb. 1954
Mario Scelba	Feb. 1954 to June 1955
Antonio Segni	June 1955 to May 1957
Adone Zoli	May 1957 to June 1958
Amintore Fanfani	June 1958 to Jan. 1959
Antonio Segni	Feb. 1959 to Feb. 1960
Fernando Tambroni	March 1960 to July 1960
Amintore Fanfani	July 1960 to June 1963
Giovanni Leone	June 1963 to Nov. 1963
Aldo Moro	from Nov. 1963

Governmental continuity was maintained through the office of the president, who is elected for a fixed 7-year term. Luigi Einaudi, the first president, was succeeded by Giovanni Gronchi in 1955. Antonio Segni succeeded Gronchi in 1962. Segni resigned because of ill health in 1964, and was succeeded by Giuseppe Saragat.

Bibliography.—**BIBLIOGRAPHICAL MATERIAL:** Two full and organic bibliographies of Italian history are those of Luigi Salvatorelli, *Sommario della storia d'Italia*, 5th ed. (Turin 1948); and the article on the history of Italy in the *Enciclopedia Italiana* (Rome 1933).

GENERAL WORKS: Lodovico Antonio Muratori's *Annali d'Italia* (Milan 1744-49) was continued by Antonio Coppi for the period 1750-1861 (Rome 1848-67); Isaia Ghiron for the period 1861-70 (Milan 1888-90); and Pietro Vigo for the period 1870-98 (Milan 1908-1915); recently revised is Janet P. Trevelyan's *Short History of the Italian People*, 4th ed. (New York 1956).

PREHISTORY, THE GREEK-ETRUSCAN AGE, AND ROMAN ITALY: Bailey, Cyril, ed., *The Legacy of Rome* (New York 1923); Homo, L., *Primitive Italy and the Beginnings of Roman Imperialism*, tr. from French by V. G. Childe (New York 1926); Devoto, Giacomo, *Gli antichi italici* (Florence 1931); Rostovtzeff, M. I., *Social and Economic History of the Roman Empire* (Oxford 1926); Ital. ed. (Florence 1933); Patroni, Giovanni, *La Preistoria*, 2 vols. (Milan 1937); Whatmough, J., *Foundations of Roman Italy* (London 1937); Trever, A. A., *History of Ancient Civilization*, Vol. 2, *The Roman World* (New York 1939).

THE EARLY MIDDLE AGES: Hodgkin, Thomas, *Italy and her Invaders*, reissue, 4 vols. (New York 1931); Hampe, Karl, *Deutsche Kaisergeschichte in der Zeit der Salier und Stauffer*, 7th ed. (Leipzig 1937); Salvatorelli, Luigi, *L'Italia medioevale, dalle invasioni barbariche agli inizi del secolo XI* (Milan 1938); Amari, Michele, *Storia dei Musulmani di Sicilia*, rev. ed., 3 vols. (Catania 1933-39); Cochrane, C. N., *Christianity and Classical Culture* (New York 1944); Cessi, Roberto, *Storia della Repubblica di Venezia*, 2 vols. (Milan 1945-46).

THE LATE MIDDLE AGES: Salvatorelli, Luigi, *Vita di San Francesco d'Assisi*, 2d ed. (Bari 1928); Croce, Benedetto, *Storia del regno di Napoli*, 2d ed. (Bari 1931); Doren, Alfred, *Italienische Wirtschaftsgeschichte* (Jena 1934); Kretschmayr, Heinrich, *Geschichte von Venedig*, 3 vols. (Gotha 1905-34); Schevill, Ferdinand, *A History of Florence* (New York 1936); Scarsella, A. R., *Il Comune dei Consoli*, vols. 2 and 3 of *Storia di Genova* (Genoa 1941-42); Morghen, Raffaello, *Osservazioni critiche sulle eresie medioevali*, Archivio della società romana di Storia patria Monograph No. 67 (Rome 1944); Cessi, Roberto, *Storia della Repubblica di Venezia*, 2 vols. (Milan 1945-46); Saporì, Armando, *Studi di storia economica medioevale*, 2d ed. (Florence 1946).

THE RENAISSANCE AND THE 17TH CENTURY: Pastor von Camperfelden, Ludwig von, *Geschichte der Päpste seit dem Ausgang des Mittelalters*, 16 vols. (Freiburg im Breisgau 1891-1933); Brandi, Karl, *Kaiser Karl V* (Munich 1937); Ettore, Rota, ed., *Problemi storici e orientamenti storiografici*: Cantimori, Delio, *La Riforma in Italia*; Chabod, Federico, *Il Rinascimento* (Como 1942); Symonds, John Addington, *The Renaissance in Italy*, 7 vols. (London 1875-86 and subsequent eds.); Ady, Cecilia Mary, *Lorenzo dei Medici and Renaissance Italy* (New York 1955); Burckhardt, J., *Civilization of the Renaissance*, tr. by S. G. C. Middlemore, *Modern Library Series* (New York 1956).

18TH CENTURY REFORMISM AND THE RISORGIMENTO: Lemmi, Francesco, *Le origini del Risorgimento italiano, 1748-1815*, 2d ed. (Milan 1924); Trevelyan, G. M., *Garibaldi*, reissue (New York 1933); Marriott, J. A. R., *Makers of Modern Italy*, 2d ed. (New York 1937); Salvatorelli, Luigi, *Pensiero e azione del Risorgimento*, 2d ed. (Turin 1944); Spellanzon, Cesare, *Storia del Risorgimento e dell'unità d'Italia*, 5 vols. (Milan 1933-45); Mack Smith, Denis, *Cavour and Garibaldi, 1860* (Cambridge, Eng., 1954); Salvemini, Gaetano, *Mazzini*, tr. from Italian by I. M. Rawson (London 1956).

MODERN ITALY: Croce, Benedetto, *Storia d'Italia 1871-1915*, 3d ed. (Bari 1928); id., *A History of Italy, 1871-1915*, tr. from Italian by C. M. Ady (New York 1929); Borgese, G. A., *Goliath, the March of Fascism* (New York 1937); Salvatorelli, Luigi, *La Triplice Alleanza* (Milan 1939); Bonomi, Ivanoe, *La politica italiana da Porta Pia a Vittorio Veneto* (Turin 1944); Perticone, Giacomo, *La politica italiana nell'ultimo trentennio*, 3 vols. (Rome 1945-47); Barbagallo, Corrado, ed., *Cento anni di vita italiana, 1848-1948*, 2 vols. (Milan 1949); Albrecht-Carré, R., *Italy from Napoleon to Mussolini* (New York 1950); Hughes, F. Stuart, *United States and Italy* (Cambridge, Mass., 1953); Salvemini, Gaetano, *Prelude to World War II*, tr. from Italian by Hélène Cantarella (London 1953).

LUIGI SALVATORELLI,

Author of "A Concise History of Italy."

Revised in "The Encyclopedia Americana" Editorial Office.

4. LANGUAGE. We shall discuss in this article two main questions: how the numerous dialects spoken in modern Italy grew out of Latin, and how the Tuscan dialect took precedence over the others and became the Italian language. First, however, we must set the linguistic boundaries of our inquiry and mention such peripheral variations as the Sardinian and Latin dialects.

Linguistic Boundaries.—The area in which Italian dialects are spoken and standard Italian is the accepted legal and literary language coincides for the most part with the territory of the Italian Republic. The following are the principal exceptions to this general rule.

Non-Italian Areas in Which Italian Dialects Are Spoken.—The dialects of Corsica are of the Italian type, but the official language and that taught in the schools is French. The Ligurian dialect, strongly influenced by Provençal, is current in several French border villages and in the principality of Monaco.

In Switzerland, Lombard dialects are spoken, and standard Italian is the official language of the canton of Ticino and the valleys of Mesocco (Mesolcina), Bregaglia, and Poschiavo of the canton of Graubünden (Grisons).

The majority of the people of the Free Territory of Trieste are Italians. Italian dialects of

the Venetian and archaic Istrian types are spoken in western Istria, which is part of Yugoslavia. Venetian dialects are also spoken by sizable minorities in the cities of Dalmatia and by a small group of Jews on the island of Corfu.

In the Republic of San Marino, dialects of Romagna are spoken, and Italian is of course the official language. Until 1934, Italian was used in the schools and courts of Malta on an equal footing with English, and about one sixth of the people on the island speak Italian. Finally, Italian is used extensively in the former Italian possessions in Africa and by Italian immigrants all over the world.

Italian Areas in Which Non-Italian Dialects Are Spoken.—There are in Italy a number of "peninsulas" (areas contiguous to foreign countries across the Alps) and "islands" where languages other than Italian are spoken. French dialects of the Franco-Provençal and Provençal groups (see *PROVENÇAL LANGUAGE*) are spoken in approximately 70 communes of Valle d'Aosta and in several valleys of western Piedmont where the Waldenses (q.v.) are established. Mid-14th century Waldensian migrations created two Franco-Provençal villages in the Province of Foggia, in Apulia, and one Provençal village in the Province of Cosenza, in Calabria.

German dialects are spoken by a majority of the people of the Alto Adige (South Tirol), but in some sections there are sizable Italian minorities, and in four valleys Ladin is spoken. Other small German-speaking groups, some of long standing, are scattered along the Alps from Monte Rosa in the west to the Carnic Alps in the east. They include in all no more than 9,000 persons.

There are a few Slovenes in the eastern part of Friuli, and a Croat "island" of three villages in the Province of Campobasso, in Molise. In southern Italy we find 47 Albanian-speaking villages, founded by Albanians who fled across the Adriatic during the wars of Scanderbeg (q.v.) against the Turks in the mid-15th century.

Greek is spoken in 13 villages grouped in two small areas at the extreme southern point of Calabria and near Lecce in Apulia. At Alghero, in Sardinia, the language is Catalan.

Inter-Italian. Linguistic Migrations.—At Carloforte, on the tiny island of San Pietro west of Sardinia, a Ligurian dialect is spoken, and several villages in Sicily were founded by Lombards who came south from the valleys of Lago Maggiore between the 11th and 13th centuries.

Sardinian, Ladin, and Dalmatian.—There are two groups of dialects (the last trace of a third disappeared at the end of the 19th century) spoken along the borders of Italy, which without actually belonging to the Italian group are closer to it than they are to any of the other Romance languages.

Sardinian.—The dialects of Logudoro (north central Sardinia) and Campidano (southern Sardinia) have a conservative character all their own. In contrast to Italian, they retain the hard sound of the Latin *c* before *e* and *i*: Latin *decem*, Sardinian *deghe*, Italian *dieci* (ten); Latin *dulcis*, Sardinian *dulke*, Italian *dolce* (sweet). Final *s* is also retained: Latin *tres*, Sardinian *tres*, Italian *tre* (three); Latin *facis*, Sardinian *faghes* (you do or make). The definite article in Sardinian is *su*, *sa* (plural: *sos*, *sas*), derived from the Latin *ipse*, *ipsum* (self). All the other Romance languages except the Catalan spoken in the Balearic Islands have definite articles taken

from the Latin *ille, illud* (that). Although Sardinian was formerly used in official papers and is a vehicle in folk literature, it has never been a literary language.

Ladin.—Three groups of Rhaeto-Romanic languages—the first in the Swiss canton of Graubünden; the second in several valleys of the Dolomites in Venezia Tridentina (Val Gardena, Val Badia e Marebbe, Val di Fassa, and Livinalongo); the third covering Friuli around Udine (and formerly Trieste)—were scientifically studied and first described as an independent linguistic unit under the name of Ladin by Graziadio Ascoli (q.v.) in 1873. (Strictly speaking, the name Ladin applies to only one of the Graubünden types.) Other scholars prefer the general term Rhaetian or Rhaeto-Romansh.

Even scholars who maintain that these dialects are a single unit consider their unity to be of a negative or passive kind. They are similar not in the active development of common characteristics, but in their retention of archaic traits and their refusal to accept innovations stemming from Italian dialects. The most widespread characteristic of the Ladin dialects is the palatalization of the *ca* group: as in Latin, *calida*; Ladin *cauda*, *çada*, *çada*; Italian *calda* (warm).

Friuli has a minor literary tradition, and the canton of Graubünden has produced a considerable body of verse and prose since the 16th century. In 1937, Romansh was recognized as a fourth national language by the Swiss Parliament, although it was not admitted to the official status of German, French, and Italian.

Dalmatian.—Dalmatian was spoken in the Middle Ages in the coastal cities of Dalmatia. It has been extinct for a fairly long time—in Dubrovnik (Ragusa), for example, since the end of the 15th century. Antonio Udina, the last man to speak Veglioto, the local Dalmatian dialect of Krk (Veglia), died in 1898.

Latin vowels change in Dalmatian to diphthongs—Latin and Italian *capra*, Veglioto, *kuobra* (goat)—but consonants have been retained. Here, as in Sardinian, *ce* is hard: Latin *cena* (supper), Italian *cena* (palatal), Veglioto *kaina*.

Italian Dialects.—Italian dialects differ more among themselves and from the standard language than those of any other country. So great are the differences that a Piedmontese and a Sicilian who knew only their own dialects would have great difficulty in understanding each other. Despite these differences between the dialects of one end of the peninsula and the other, however, there are very few cases of sharply drawn dividing lines between one dialect and another geographically adjacent to it. Different words and grammatical constructions cover areas which coincide only partially, if at all, with other factors. For these reasons, the classification of Italian dialects is in great part arbitrary and dependent upon nonlinguistic criteria. Keeping this point in mind, we may list the following groups.

Gallo-Italian Dialects.—This group includes dialects belonging to the following subdivisions: Piedmontese, Ligurian, Lombard, and Emilian. Each corresponds roughly to the region of the same name. We say roughly because Lombard, for example, not only includes the dialects of the Swiss canton of Ticino and the three Italian valleys of the canton of Graubünden, but is carried over into the dialects of western Trentino. Moreover, Voghera, Pavia, and Mantova, which be-

long administratively to Lombardy, have dialects of the Emilian type.

Generally speaking, the Gallo-Italian dialects closely resemble French dialects, particularly those of the Provençal group. Piedmontese, Ligurian, and Lombard have the mixed vowels *ü* and *ö*, while Emilian has only *ü*. They almost all drop final vowels, except for *a*: Latin *septe* (*m*), dialect *set*, Italian *sette* (seven); Latin *octo*, dialect *ot*, *vot*, *öt*, Italian *otto* (eight).

Venetian Dialects.—These dialects fall into three subdivisions: Venetian proper, Trentino, and Istrian. Their lack of mixed vowels and retention of final vowels brings them closer to Tuscan usage than to that of the Gallo-Italian group. On the other hand, Gallo-Italian affinities are seen in the substitution of the voiced for the voiceless stop—as in *séda*, Latin *seta*, Italian *seta* (silk)—in the reduction of a double to a single consonant—*sète*, Latin *septe* (*m*); *òto*, Latin *octo*—and in vocabulary.

Tuscan Dialects.—This group has the greatest historical importance, since it became the basis of standard Italian. Cultivated Florentine speech is almost identical with the standard written language, although we may note the recent reduction of the diphthong *uo* to *o*—*bòno*, *còre*, instead of *buono* (good), *cuore* (heart)—and the aspirate pronunciation of guttural *c*—*amerihano* instead of *americano* (American). The latter does not occur, however, when *c* follows another consonant, as in *barca* (boat) and *panca* (bench). Vernacular Florentine speech has several characteristics of its own. There are also quite a few variations from cultivated Florentine in the popular spoken language of northwestern Tuscany (Lucca, Pisa) and southeastern Tuscany (Siena, Arezzo).

If we compare Tuscan with other Italian dialect groups in regard to its fidelity to Latin, we find it almost always more conservative. It has few peculiar deviations from Latin: let us look, for example, at the changes in the Latin ending *-ariu* (*m*), as in *Januariu* (*m*) and *librariu* (*m*). In northern and southern Italy, except for some later changes, it is pronounced *-aro*; only in Tuscany (and Umbria) do we find *-aio*, as in *gennaio* (January) and *librario* (bookseller).

As might be expected from its geographical position, Tuscan is often midway between northern and southern forms. The definite article, for example, in the north is usually of the *el* type, and in the south of the *lo* or *lu* type. In Tuscan both forms are used, depending upon the noun: *il libro* (the book); and *lo stato* (the state). In northern Italy the past indefinite (*ho fatto*, have done or made) is used rather than the past definite (*feci*, did or made) current in the south, while Tuscan assigns to each a separate use. Such compromises helped to bring about the adoption of Tuscan as the standard language.

Corsican Dialects.—In their modern form, Corsican dialects are very much like Tuscan, but beneath the surface there are traces of an archaic phase in which they must have resembled Sardinian. The dialects of northern Sardinia, both the Sassari type and that of Gallura, are closely akin to the Corsican.

Central Italian Dialects.—The dialects of northern Latium, Umbria, and Marche form a compact group in which characteristics of the south are visible. (This is particularly true of the central region around Ancona, since Pesaro is closer to the Emilian dialect, and Ascoli to

the Abruzzan.) Over a wide area a distinction is made between Latin endings in *o* and *u*.

Southern Dialects.—These include the dialects of southern Latium, Abruzzi, Campania, Calabria, Apulia, and Sicily. Throughout this area and in part of central Italy, we find Latin *nd* changed into *nn* (Latin and Italian *quando*, dialect *quannë*, when) and *mb* into *mm* (Vulgar Latin *camba*, Italian *gamba*, dialect *gammna*, leg). Somewhat restricted to the south is the change of *pl* to *kj* (Latin *plus*, Italian *più*, dialect *kju*, more), and even more restricted (but interesting because it is found also in Corsica) is the change of *ll* to *dd*, a *d* sound pronounced with the tip of the tongue far back in the mouth (Latin and Italian *bella*, dialect *bedda*, beautiful). In the far south (Calabria, southern Apulia, and Sicily) the accented Latin vowels *i* and *e* appear as *i* (Latin *pilu*[*m*], Italian *pelo*, dialect *pilu*, hair; Latin and Italian *tela*, dialect *tila*, cloth), and the vowels *ü* and *ö* as *u* (Latin *ingulm*], Italian *giogo*, dialect *jugu*, yoke; Latin *spo*[*n*]*su*[*m*], Italian *sposo*, dialect, *spusu*, spouse).

Dialectal Diversity and Origins.—In order to give some idea of the complex differences among the Italian dialects, here are four versions of a passage from the *Decameron* (*First Day, Ninth Tale*), preceded by an English translation printed in 1620:

English Version: "Sir, I presume not into your presence, as hoping to have redresse by you, for divers dishonourable injuries done unto me; but, as full satisfaction for them, doe but teach me how you suffer such vile abuses, as daily are offered to your selfe. To the end, that being therein instructed by you, I may the more patiently beare mine owne."

Original Text, Florentine of the 14th Century: "Signor mio, io non vengo nella tua presenza per vendetta che io attenda della ingiuria che m'è stata fatta, ma, in sodisfacimento di quella, ti priego che tu m'insegni come tu sofferi quelle le quali intendo che ti son fatte, acciò che, da te apparando, io possa pazientemente la mia comportare."

Turin: Sgnor, i véno nen ant vostra presensa pèrch'i spera d'otnine vendèta dèl'ingiuria ca m'an fame; ma, per chi pòsa soportella, i v' prego de mostreme com i feve a tolerè cule ch'i sento ch'a fan a voi, pèrchè, 'mparand da voi, i pòsa soportè pasientement la mia."

Bologna: "Sgnour mi en t' pinsar ch'at seppa vgnò dinanz perchè t'fagh el mi vendè del'inzuri, ch'm'ein sta fatti da zert galiut, ma in scambi d' quelli a pregh bèn ch' t' m'insegn almanch, cum t' fa a supurtar quelli, cha intènd, ch' t' ein fatti dal zèint alti: aziò ch'a possa imparar d' guernarom, e d' supurtar anca me la mi cun pazenzia."

Palermo: "Maistà, iu nun vègnu a la tò prisenza pirchi m'aspettu giustizia di l'offisa ch'haju avuta fatta, ma pri prigarivi di 'nsignàrimi comu soffritti tutti l'offisi ch'i iu haju 'ntisu diri chi vi fannu, acciuchhi, 'mparannu da vui, putissi iu cu pacenza supurtari la mia."

What are the reasons for such conspicuous differences? Linguists offer us three distinct explanations. According to the substratum theory, many differences are due to the fact that as the Latin language spread through Italy with the Roman conquests it was adopted by peoples of other stocks and languages, who pronounced it according to their own ways of talking and began to modify it. Changes would have taken place, then, either immediately, when the various peoples first learned Latin or later, when the decline of the Roman Empire and its cultural influences paved the way for mutations. The substrata which appear to have had the strongest influence were the Celtic (on the Gallo-Italian dialects) and the Osco-Umbrian (on the central and southern dialects). Tuscany, however, seems to have been practically immune to the influence of the Etruscan substratum.

According to the superstratum theory, much change is due to the Germanic invasions which

brought about the fall of the Roman Empire. But while everyone recognizes a strong Germanic influence on the Italian vocabulary, phonetic and morphological influences are highly debatable.

The third theory is based on the development of local patriotism at the height of the Middle Ages, and particularly during the era of the Italian communes. This theory is substantiated by the fact that many of the differences found in modern Italy do not occur in the earliest texts and appear to have had a late origin.

There is no essential contradiction in these theories. We need only establish in what measure each of the three influences contributed to the changes that took place.

Standard Italian.—Latin remained the only written language for many centuries after it was no longer spoken and had been transformed in the former Roman provinces into a variety of dialects. Very gradually, in the countries which were to belong to the Romance language group, the spoken language crept into writing. The requirements of written language and the example of Latin prevented the development of writing in outright dialect form. On the contrary, there was an effort to eliminate terms that were too colloquial and to refine and broaden the dialect—in short, to make it into a language.

Except for a riddle written in Verona in the 9th century (which we cannot be sure the author intended to write in the vernacular rather than in Latin), the earliest examples of sentences written in the vernacular come from four documents written in the principality of Benevento between 960 and 963, referring to properties of monasteries connected with Monte Cassino. These sentences were prepared statements for witnesses on the stand. The first runs: "*Sao ho kelle terre, per kelle finì que ki contene, trenta anni le possette parte Sancti Benedicti.*" ("I know that the land within the boundaries mentioned here has been for 30 years among the possessions of St. Benedict.")

There are few other examples of vernacular writing until the early part of the 13th century, when a courtly form of lyric derived from a Provençal model appeared at the court of King Frederick I of Sicily (Emperor Frederick II). Though quite cold and conventional in feeling, this type of poetry is extremely important as the earliest example of Italian lyric verse. Unfortunately, we lack a thorough acquaintance with the language of the poets of the Sicilian school because their manuscripts were copied in Tuscany at the end of the 13th century and extensively altered. We can reconstruct the original Sicilian dialect to some degree only by studying the rhymes.

There was an attempt made in the 13th century to create a literary language in Bologna, seat of one of the most important medieval universities. During the second quarter of the century, Guido Fava (c.1190–c.1243) published *Gemma purpurea*, a collection of model letters written under various circumstances by imaginary characters. The purpose of the letters was practical, but their style aimed at a certain elegance. In the same period, Guido Guinizelli or Guinicelli (q.v.) wrote half-amorous, half-philosophical lyrics which are highly important in the development of the language, although here too the existing texts are none too exact. Guinizelli's example and the humble efforts of poets in Lucca, Pisa, and Arezzo came to a climax when Dante

Alighieri (q.v.) and his contemporaries created the *dolce stil nuovo* (sweet new style).

A number of circumstances combined to give Florence in the period from the end of the 13th century through the first half of the 14th century a privileged position among the cities of Tuscany, and indeed of all Italy. Speaking of its political influence, Giovanni Villani (1280?–1348) said that Florence, originally an offshoot of Rome, had begun at this time to rise while Rome was in decline. Other factors were the growth of commercial enterprises trading with all of western Europe, and the extraordinary flowering of the arts which accompanied the building of Santa Maria del Fiore (begun c. 1298) and the Palazzo Vecchio. Dante, who in the *Divina Commedia* sang of earthly passions and heavenly bliss, and in *Il Convivio* wedded prose to the subtleties of scholastic thought, won immortality for the language in which he wrote. The Florentine tongue, which in the 13th century had been the humble vehicle of commercial registers, chronicles, the rules of confraternities, and translations, was now the basis for literature of every kind. In the following generation, Petrarch (Ital. Francesco Petrarca) and Giovanni Boccaccio (q.v.) continued the Florentine tradition. The subtle analysis and veiled melancholy of Petrarch's *Il Canzoniere* and the exuberant tribute to the man's ingeniousness of Boccaccio's *Decameron* made with the *Divina Commedia* a perfect three-sided picture. Different as the three writers were, their common greatness was such as to inspire a host of followers to use the Florentine vernacular and to withstand the humanist attempt in the 15th century to reinstate Latin as a literary language.

Books were printed in Italian for the first time in 1470. Within three years, along with the Bible and a very few other works, there were three editions of *Il Canzoniere*, three of the *Decameron*, and three of the *Divina Commedia*. The introduction of printing marks a decisive period in the history of the Italian language. Previously, in northern and southern Italy alike, each author had written as best he could, striving to dignify his native dialect with the aid of Latin and occasional reference to such Tuscan writings as might have come his way. Now the advent of printing made it plainly necessary for Italian, as well as Latin, to acquire uniformity. The printer's work reached readers in various parts of the peninsula, and he could not offend their taste with an excess of dialectal usages. Moreover in this same period national states were developing in other parts of Europe: in Spain with the union of Castile and Aragon (1479) and the expulsion of the Arabs (1492); in France with the triumph of Louis XI (r. 1461–1483) over feudal individualism and the annexation of Brittany (1491). In Italy the time was not yet ripe for political unification, but in the 16th century a considerable degree of linguistic unity was attained. This unity was accomplished by literary influences, that is, by imitation of the three great writers of the 14th century. Such imitation was recommended particularly by Pietro Bembo (q.v.), a Venetian who held undisputed sway over the fields of literature and linguistics in the early part of the 16th century. Tuscan as well as northern writers followed the rules which he laid down in 1525 in his *Prose della volgar lingua*. Writers of the south, too, tended to imitate the great 14th century models, as is shown in the

work of Jacopo Sannazaro (q.v.), author of *Arcadia* (1504).

To what extent did the three great Tuscan writers influence the progress of linguistic unification? The following metaphor may give an idea. Imagine a forest where for several centuries hundreds of plants of the same species but of different varieties have reproduced themselves spontaneously without human interference. Then suppose that a horticulturist comes along, chooses the best variety, and grafts it on all the rest. If we compare the spontaneous growths to all the dialects of Latin origin, and Tuscan to the variety chosen for grafting upon the others, we shall see what happened in Italy in the 16th century.

A number of phonetic characteristics show that modern standard Italian grew out of the Tuscan, or rather the Florentine, dialect. We saw that in both northern and southern Italy the Latin ending *-ariu(m)* changed to *-aro*, while in Tuscany it became *-aio*. Moreover, closed *e* and *o* in certain positions (before palatal *gl* and *ng*) changed only in Florence and its immediate neighborhood to *i* and *u*. If dialects from various regions had combined to make Italian, or if another Tuscan type, such as the Sienese, had prevailed, then we should say *fameglia* instead of *famiglia* (Latin *familia*, family), and *lungo* instead of *lungo* (Latin *longus*, long). Nevertheless, we must remember that in the 16th century the matter did not yet appear to be definitely settled, and innumerable disputes raged about what was called the *questione della lingua* (language question).

The position of Tuscan as a literary language was consolidated by an institution founded in 1582 which exercised for some time a considerable influence: the Accademia della Crusca (literally, Academy of the Bran, or Chaff). This name, originally somewhat of a joke, soon came to be considered symbolic of the academy's chief task, that of distinguishing between good language and bad, in the same way that wheat is separated from chaff. In 1612, the academy published the first great historical and grammatical dictionary of a modern language. This dictionary was imitated in other countries for two centuries thereafter.

The general trend of the 18th century dominated by Enlightenment and French influence, lessened the literary and linguistic sway of the classics. In the early 19th century writers wavered between a ponderous imitation of 14th or 16th century language and a loose style containing many Gallicisms. The two editions of Alessandro Manzoni's celebrated novel *I promessi sposi* (1825–1827 and 1840–1842) constitute what may be called a linguistic manifesto. (See BETROTHED, THE). The great Milanese romantic writer insisted on using a live, modern language patterned not on mere imitation of the past, but on the contemporary usage of the city of Florence. Thereafter, the course of the Italian language followed the political developments which led to the formation of the Italian nation and its life as a single political unit. Commercial and cultural exchanges increased, and the standard language became more uniform.

The formation of standard Italian took place in a different way from that of other major languages. Literature, as we have seen, was the chief factor in its evolution, rather than the extension of royal government, as was the case in France, or the translation of the Bible and the

influence of the usage of the imperial chancery, as in Germany. This explains why it was so difficult for Italian to take definite shape. It achieved uniformity only after long struggles between various stylistic ideals, and this meant strong divergencies in both vocabulary and grammar. For this reason, modern Italian retains a number of legitimate variations of usage. We may say *danaro* or *denaro* (money); *obiettivo* or *obbiettivo* (objective); *patriota* or *patriotta* (patriot); and *soprintendere*, *sovrintendere*, *sopraintendere*, or *souvaintendere* (superintend). Many grammatical rules, too, are optional. We may use either *pomodori* or *pomidori* as the plural of *pomodoro* (tomato), and the forms *io ho visto i libri* and *io ho visti i libri* (I have seen the books) are both equally correct.

The struggles over usage, grouped together as the *questione della lingua*, were particularly sharp in the 16th and 19th centuries. First there was much discussion on what precisely the Italian language should be and whether the prevalent tongue should be called courtly or vernacular, Florentine, Tuscan, or Italian. In the first half of the 19th century controversy centered about the 14th century revival proclaimed by Father Antonio Cesari (1760-1828); in the second half about whether literary language should conform to the usages of the cultivated Florentine, as Alessandro Manzoni proposed. The constant patterning of the Italian language on literary models is due to the highly developed individuality of the Italian people and their strong aesthetic sense. Moreover, literary influence came to predominate on a large scale because, after the modest beginnings of its literary history, Italy produced three writers of the stature of Dante, Petrarch, and Boccaccio.

We must add a word about the stability of Italian grammatical forms. Italian never underwent changes so great as to upset its phonetic system; there was no mutation in vowel sounds such as took place in both French and English up to comparatively recent times. Here, then, we have the most striking characteristic of Italian as compared with other languages, its longevity. In France an understanding of the 11th century *Chanson de Roland* requires the study of what is almost a foreign language, and even writers of the 16th century use forms that are considered archaic today. The same is true of English, German, and Spanish. But the average modern Italian, although the meanings of some words and constructions may escape him, can still feel that his language is that of Dante.

Professor of History of the Italian Language, University of Florence.

5. LITERATURE. From the Earliest Times to Dante.—The writing that was done in Italy from the fall of the Western Roman Empire to the beginning of the 13th century was Latin; it belongs to a period of transition from Roman literature to Italian literature, and it was European rather than Italian in scope. Its chief

subject was philosophy, especially scholastic philosophy, and such purely literary works as were written were of inferior caliber. A study known as *ars dictandi* (art of composition), which aimed at setting up standards in the literary field (more exactly, in letter writing), began at Monte Cassino in the 11th century and was elaborated in a number of treatises even beyond the 13th century. These treatises showed no trace of the classical spirit, which continued to be lacking until Dante revived it.

Among the literary documents of this period we may recall the *Chronicon Novaliense* (first half of the 11th century), a crudely but vigorously told cycle of legends, and the 12th and 13th century verses of the wandering students or jesters known as the goliards, which broke out in every country of Europe (see GOLIARD). The tone of these verses was sensual and anticlerical, and they were written in rhythmical meter. The use of rhythmical meter and the development of the Italian language are milestones in the separation of Italian from Latin literature.

The first literary documents in popular Italian date from the 13th century; they consist largely of religious poetry and that of the so-called Sicilian school. Among the religious poems of the time are *De Jerusalem celesti* and *De Babilonia civitate infernali* by Giacomino da Verona (fl. second half of the 13th century); the *Libro delle tre scritture* of Bonvesin da la Riva (1240-1315), containing a vivid description of the torments of hell; *Il cantico del sole*, or *delle creature* (see CANTICO OF BROTHER SUN, THE), of St. Francis of Assisi (1182-1226), which set the tone of the tender and spontaneous ascetic prose of the 13th to the 15th century; and the *laudi* (hymns of praise) of the Franciscan monk Jacopone da Todi (c. 1230-1306), reputed author of the *Stabat Mater* (q.v.), which range from the heights of mystical ecstasy to the depths of despair and are, despite their faults, expressions of the most powerful Italian poetical genius before Dante. The Sicilian school, which centered about the court of King Frederick I of Sicily (Emperor Frederick II, q.v.) in the first half of the 13th century, was an offshoot of Provençal poetry and celebrated a somewhat conventional courtly love. The leaders of this school were Giacomo da Lentini or Lentino, Giacomino Pugliese, and Guido delle Colonne. Other poets were Rinaldo d'Aquino and Odo delle Colonne, who wrote two spontaneous popular poems. Also in the popular vein is *Rosa fresca aulentissima*, a sprightly tale of a lovers' quarrel by another Sicilian, Cielo d'Alcamo (fl. mid-13th century).

Epics wrought of Carolingian, Breton, and classical material in Franco-Venetian verse or Italian prose occupy a secondary place, together with such moral allegories as the *Fiore*, *Li Livres dou Trésor* (in French prose) of Brunetto Latini (1212?-1294), and the same writer's *Il Tesoretto*, in seven-syllable verse. Of distinct value is *Il Milione* (tr. into English as *The Book of Marco Polo*), a fabulous narrative of Polo's travels through Asia as told to Rustichello da Pisa and written in a mingled French and Italian prose.

Several Tuscan poets of the transitional period stem from the Sicilian school, among them Guittone d'Arezzo (c. 1230-1294) and Chiaro Davanzati (fl. second half of the 13th century). Superior to them were the poets of the *dolce stil nuovo* (sweet new style). This school begins

with Guido Guinizelli or Guinicelli (1240?-1274). Its leaders were Dante Alighieri and Guido Cavalcanti (c. 1250-1300) of Florence, and a later follower of less importance was Cino da Pistoia (Guittoncino de' Sinibaldi, 1270-1336). Their poetry is idealistic with psychological overtones and is influenced by religion and philosophy. The chief subject is the angelic woman, described by Dante as "*venuta di cielo in terra a miracol mostrare*." Beside these idealistic lyrics are examples of realism and satire, best represented by Cecco Angiolieri (1250?-1312) of Siena, the author of many sonnets, of which the most famous is a curse on the entire world, including his own father and mother.

The prose of this period is simple almost to the point of being elementary; translations from the Latin were only just beginning to nourish and invigorate its syntax and capacity for expression. It deals with the details of city life, adventures culled from the Breton cycle, and moral reflections. The best prose is to be found in *Il Novellino*, a collection of biblical, classical, and medieval stories, told in short sentences and occasionally displaying real talent in pinning down the salient features of an event or a character. In the *Tavola rotonda* we find a more complex style and in certain passages a feeling of epic solemnity. Little originality is to be found in *Il libro dei Sette Savi*, *I conti di antichi cavalieri*, or *I fatti di Cesare*.

Dante.—With Dante a new spirit enters into the favorite themes of medieval literature and the echoes of classical antiquity. He was by nature vigorous and prone to synthesize; his art he learned from Vergil and his disciplined thinking from St. Thomas Aquinas. Dante Alighieri was born in Florence in May 1265. The most influential events of his life were his love for Beatrice (c. 1289) and the exile imposed upon him on Jan. 27, 1302, by the Neri (Black) faction of the Guelphs (q.v.), who, supported by Pope Boniface VIII, prevailed at this time over the Bianchi (Whites). After many wanderings the poet died in exile at Ravenna in 1321. Dante's love for Beatrice inspired *La Vita Nuova*, a youthful volume of poems and prose pieces whose heroine is celebrated in terms even more idealistic than those of the *dolce stil nuovo* and is promised the dedication of another and loftier work, the *Divina Commedia* (see DIVINE COMEDY).

In the *Divina Commedia* the themes of love and politics are mingled. Beatrice saves Dante from a life of sin and leads him, first through the intermediary of Vergil and then herself in person, through hell, purgatory, and paradise to the contemplation of God, while at the same time we have projected into the three realms of the after-life a picture of the spiritual and political life of the poet's time. The power of this masterpiece lies, then, in its depiction of Dante's own world as seen from beyond the grave. Other periods of history are involved, but only sporadically and as forerunners of the events of Dante's lifetime. Dante saw the world around him as ill governed because of the evil ways of the church and the abandonment of Italy by the Holy Roman Empire. It is plain in various parts of the poem that exile contributed to his pessimistic views and made him a scornful judge of his own times and a prophet of dire things to come.

This work, which he called simply the *Commedia* (the adjective *Divina* was added later) is, as we have seen, the story of Dante's spiritual

purification in the course of an imaginary visit to the next world, accomplished through his contact with the inhabitants thereof, so that the poet is seen among the passions, struggles, and civilization of his age. The broad scope of the poem derives from its double meaning as an autobiography and the spiritual history of a period. Dante himself, who is vigorously portrayed, undergoes a change as he moves from region to region of the afterlife. In the *Inferno* he is an enemy of those whom he meets and an implacable judge. In the *Purgatorio* he turns inward and meditates as he walks in brotherly fashion beside the thoughtful souls who dwell there. In the *Paradiso* he rises above all earthly passions. Each region has an individual coloring, which is reflected in its physical background and the characters who people it, as well as in the frame of mind of the poet. Quite naturally, then, the characters of the *Inferno* are the most powerfully drawn, attached as they still are to the sinful passions that brought about their damnation. The souls of the *Purgatorio*, torn between their earthly sins and their desire for expiation, no longer live in mutual hate and enmity but are bound by a new feeling of brotherhood. In the *Paradiso* individuals lose their identity and are made one in a chorus of harmony and praise. The landscape of the *Inferno* is dark, rough, and fearsome; that of the *Purgatorio*, isolated in the ocean, is calm and invites to meditation; the *Paradiso* is laid among ever-widening and more luminous vistas of the heavens.

This is the general layout of the poem. If it had been rigidly maintained the result would have been methodical to the point of monotony, but, as it is, every now and then the pattern is broken. The damned are portrayed with sympathy, affection, and even admiration, for grave sins, after all, may be caused by humanly comprehensible motives; they may go hand in hand with great qualities or be essentially pitiful and tragic. Thus we have in the *Inferno* such figures as Francesca da Rimini, Brunetto Latini, Ulysses, and Ugolino della Gherardesca (qq.v.), and Farinata degli Uberti. The meditative pages of the *Purgatorio* are interrupted by the political invective of Canto VI and the reproaches and prophecies of Canto XIV. In like fashion, the bliss of the *Paradiso* is broken by the satire directed at degenerate religious orders and St. Peter's wrath at corrupt holders of the papacy. There is immense variety in Dante's poetry, especially in the *Inferno*, which is the richest of the three parts, while the *Purgatorio* is the smoothest, and the *Paradiso* most nearly touches the summits of sublimity. In its structure and balance the poem is a model of architectonic solidity; it is also one of the most imaginative and many-sided productions of world literature.

While he wrote the *Commedia*, Dante was working on *Il Convivio* (*The Banquet*), and some pages of the latter are permeated with the elevated and sorrowful feeling of the poem. *Il Convivio* is unfinished; it was intended to be a sort of encyclopedia of philosophy, a banquet of philosophical ideas served up to the unlearned. It is made up of four treatises—that is, an introduction and three commentaries, each accompanied by a poem—containing discussions of morals, politics, metaphysics, and astrology. Many passages are commentaries on the poetical interludes, and the style, which is far removed from the dreamy tone of *La Vita Nuova*, displays the manliness

and maturity of the author of the *Commedia*.

Important for Dante's poetical theory and for the history of Italian literature, language, and versification is *De vulgari eloquentia*, a Latin work broken off at Chapter 14 of the second book. In the first book, Dante speaks of the origin and history of the Italian language; he derives Italian, French, and Provençal from a single source, thus anticipating the classification Neo-Latin or Romance later applied to them. He divides Italian dialects into 14 groups and tries to ascertain which is best suited to a tragic or lofty style, reaching the conclusion that none will suffice and that a new language must be formed by putting together the best elements that they have in common. In the second book he takes up the use of noble language in the loftiest form of poetry, which is to him the *canzone* or lyric, and studies the structure of this form.

The 13 Latin *Epistolae*, which are of considerable autobiographical interest, are close to the *De vulgari eloquentia*; they are practical demonstrations of the importance which Dante attached to painstaking study as the way to attain art. The *Epistolae* reflect many of the convictions we find in *De Monarchia*, a Latin work of a later date than *Il Convivio*, whose political views it amplifies and emends. In the three books of *De Monarchia*, Dante maintains that the world should be governed by one emperor, that this world empire is a prerogative of the Romans, and that emperor and pope are independent of one another, deriving their authority direct from God.

Among Dante's minor works we may note some of the *Rime pietrose* and the splendid political poem beginning: "*Tre donne intorno al cor mi son venute*."

Petrarch.—Politics did not play a major role in the life of Francesco Petrarca (1304-1374), known in English as Petrarch, whose chief themes are his love for Laura, his studies, and his soul. Petrarch's great love inspired *Il Canzoniere*, an idealized account of his sentiments from the first time he saw Laura until some time after her death. The prevailing feeling in *Il Canzoniere* is one of meditative sadness against a religious background that emerges more and more distinctly until the work ends with a hymn to the Virgin Mary. The originality of this book lies in the gentle contrast between love and religion, set forth in an intimate story whose bare facts count for less than their reflection in the thoughtful mind of the poet. *Il Canzoniere* set the style for lyric poetry for centuries thereafter and had a lasting influence on the love lyrics of every country of Europe. (See PETRARCH'S SONNETS.)

Petrarch also holds a prominent place in the history of the Renaissance, and may be called the first of the humanists. The Latin of the poem *Africa*, the *Epistolae metricae*, the prose letters, the moral and religious works, and *Secretum*, a book of confessions, is much closer to the classical model than that of Dante. Because of his mastery of Latin style, his deep study of the classics, and his search for lost ancient manuscripts, we may say that with Petrarch the history of humanism begins.

Boccaccio and the Lesser 14th Century Writers.—Giovanni Boccaccio (1313-1375) is less important than Petrarch in the history of humanism and linguistic development, but equally so with regard to the imprint he left on subsequent literature. His masterpiece, the *Decameron*

(q.v.), was the only model followed by Italian short story writers up until the 18th century and has exercised a continuous influence on Italian prose. This work is made up of 100 tales told by seven young ladies and three young gentlemen who take refuge in the country near Florence during the plague of 1348. The subject matter comprises tragedy, burlesque, adventure, and love; the style is now slow and solemn, now rapid and vivacious. The whole makes up a many-sided picture of the life of the gentry, clergy, scholars, rascals, and common people of the time and has a greater variety of realistic characters than any Italian prose work before the 19th century *I promessi sposi*. There is promise of the masterpiece that was to follow in Boccaccio's youthful prose and poetry, particularly in *Il ninfale fiorentino*, an idyll rich in tender and dramatic scenes.

Franco Sacchetti (1335?-1400) is a talented writer of anecdotal short stories pitched in a minor key and concerned with middle-class and peasant life. Dino Compagni (1265?-1323) writes in a fast-moving and dramatic style of the Florence of the time of Dante. Religious writers of diverse temperaments include the anonymous author of the *Fioretti di San Francesco*, the simplest and most graphic biography of St. Francis of Assisi; Domenico Cavalca (c. 1270-1342), who adapted from the Latin the psychologically penetrating *Vite dei Santi Padri*; Jacopo Passavanti (c. 1300-1357), whose *Specchio di vera penitenza* contains some of the most effectively dramatic pages of medieval literature; and St. Catherine of Siena (1347-1380), whose letters are the most passionate expression of mysticism in Italian literature.

Humanism and the 15th Century.—The period from the age of Dante to the middle of the 16th century was one of deep transformation in Italian life and letters. The change came about slowly until halfway through the 15th century, when it consciously quickened its pace. By the second half of the century educational, literary, artistic, civic, and moral ideals were far removed from those of the 13th century and in some cases diametrically opposed to them. The ancients came to be considered masters of literature and the plastic arts and of the art of living as well. The rediscovery of Greek and Roman manuscripts and archaeological remains influenced art and letters, while at the same time the destiny of man and philosophical problems in general were seen in a new light and explained in a new manner. This period of change is called the Renaissance, and the philological inquiry which brought about the renewal of classical culture is known as humanism (q.v.), from *studia humanitatis* (studies aimed at perfecting the development of the human spirit by acquaintance with the grandeurs of the past).

Forerunners of humanism besides Petrarch were Albertino Mussato (1261-1329) and Lino Coluccio di Piero Salutati (1331-1406); its center was Florence; and the first great humanists to find and annotate ancient manuscripts were Giovanni Francesco Poggio Bracciolini (1380-1459) and Lorenzo Valla (1406-1457). Other centers were the academy at Rome headed by Giulio Pomponio Leto (1428-1498), and the Accademia Pontaniana at Naples, named after its most illustrious member, Giovanni Pontano (1426-1503). At this time the first great libraries were formed and culture was encouraged by the wealthy noblemen of Naples, Ferrara, Milan, and

other cities as well as by the popes. Many authors wrote in Latin; Pontano, the greatest among them, while he imitated classical verse, also sounded a note of contemporary reality.

Colloquial Italian, submerged for a while in the humanist illusion that Latin could once more become a living language, was used in such works of a popular character as the *sacre rappresentazioni* (miracle plays) and love lyrics of Leonardo Giustiniani and the writings of other authors of various degrees of learning. Among them were Lorenzo de' Medici (1449-1492), who was prominent in the cultural life of Florence and wrote poems and songs for carnival celebrations, among them *Trionfo di Bacco e Arianna*, which is among the best lyrics of the century; Politian (Angelo Poliziano, real name Angelo Ambrogini, 1454-1494), author of *Orfeo* and *Stanze per la Giostra di Giuliano de' Medici*, an unfinished poem of incomparable polish and charm; and Luigi Pulci (1432-1484), whose poem *Il Morgante Maggiore* recalls in a style alternately tripping and stately the events of the Carolingian cycle and creates the new and immortal figure of the glutton Margutte. Away from Florence, in Ferrara, we have Matteo Maria Boiardo (1434-1494), author of *Orlando innamorato* (q.v.), wrought from material half Breton and half Carolingian in a preponderantly chivalrous, fairy-tale manner. The most notable prose writers are the architect Leon Battista Alberti (1404-1472), author of the treatise *Della Famiglia*, in dialogue form, of which certain pages are the best extant documentation of the humanistic ideals of wisdom and balance; Leonardo da Vinci (1452-1519), whose observations on life and nature show the religious element in the humanistic attitude toward the world; and Jacopo Sannazzaro (1458-1530), author of *Arcadia* (q.v.), a pastoral and amorous romance which enjoyed extraordinary success all over Europe for several centuries.

First Half of the 16th Century; Ariosto and Machiavelli.—The exaggerated rhetoric and sensuality of much of 16th century literature have detracted from its reputation. There flourished during this period a literature serious in form and content and another that was frivolous in both. That is, there was a formal literary school and also a literary production that remained light and casual even when it was camouflaged by rhetorical devices derived from Latin writers and from Boccaccio. The literature of the first half of the century was based on Platonism (q.v.) and on classical wisdom and moderation. The moral aspirations and strength of the period turned toward the world and were bounded by a concern for man's position within its confines. In this sense, the 16th century grew out of the century that preceded it and is fittingly represented by Machiavelli and Ariosto.

Lodovico Ariosto (1474-1533) was for many years in the service of the Este family in Ferrara and the Garfagnana region. His *Satire* depict the worries and restrictions imposed upon him by his court duties in contrast to the poetical genius that drew him toward a quiet life where his imagination might find free rein. His poem *Orlando Furioso* (q.v.) portrays in a series of varied and skillfully arranged episodes his own half-dreaming, half-practical nature. His imagination is agile but never extravagant; it is restrained and colored by an intense feeling for reality which never fails to surprise us in this teller of extravagant tales. The plot, drawn from

the Carolingian cycle, tells of the struggle between Christians and Saracens around Paris, where the scene of the poem is laid. But the real subject is Orlando's ill-fated love for Angelica, which eventually drives him mad. This madness dominates the greater part of the poem, but around it are built up any number of other love stories, intermittently connected with one another in an abrupt rhythm which is the poem's magical charm. The focus of the action is the palace of Atlante, where the knights wander about in a vain and illusory search for the image of their loved ones; another central episode is Astolfo's ascension to the moon. In this poem everything is at the same time concrete and elusive; the reader seems to be looking at a scene from real life when it melts away as if in a dream. Every sentiment appears and disappears again in an endless whirl of adventures; only Orlando's love for Angelica endures, in increasing tempestuousness. The style is the most natural and flowing ever to be achieved by a poet, and it has been imitated over and over again. We can see its influence in Francesco Berni and numerous poets of chivalry of the time, and it crops up continually in the mock-heroic verse of the 18th century, either alone or mingled with the heritage of Torquato Tasso and Giambattista Marino.

Niccolò Machiavelli (1469-1527), living in a period when Italian independence was disappearing, was the first prophet of its resurrection and the chief of its political thinkers. His two masterpieces are *Il Principe* (*The Prince*, q.v.), a political treatise, and a comedy entitled *La Mandragola* (*The Mandrake*).

Il Principe is based on a new and realistic political morality. The kingdom of this world is to the strong, and fortune smiles upon him. Amid a floating and spineless multitude we find a few men endowed with intelligence and will power. The heart has no place in Machiavelli's political system, and kindness is tolerated only when it does not sap a leader's energy and block the accomplishment of his plans. Machiavelli esteems strength of mind and purpose harnessed to a single goal, the highest good of the state. This treatise is a handbook for political leaders; it was written in order to instruct a prince how to take advantage of the fatal weakness of the multitude and turn it into the basis for a powerful and well-organized government. Machiavelli's philosophy is aristocratic as well as pessimistic to the point of cynicism; he has no love for the common people. It is significant that the characters of *La Mandragola*, which ranks with Carlo Goldoni's *I rusteghi* as a masterpiece of the Italian theater, should be people of humble estate whom the author treats with the utmost scorn. His attitude toward these characters is identical with the one that he recommends for a prince toward his subjects.

Machiavelli's political philosophy is inconceivable divorced from the idea of the people as passive and sheeplike masses; this is the core of his realism. No one has ever analyzed as thoroughly as Machiavelli did the temper of the leader and that of the crowd. Before his analysis political theorists had studied how man should behave rather than his actual behavior; they pursued Utopian ideals while he adheres to the "real truth." We must look for the cause of Machiavelli's attitude in the inert fatalism in which most Italians of his day had taken refuge when their country was in danger. His reaction was to call

for a prince or strong man able to stand up against fate.

The *Discorsi sulla prima deca di Tito Livio* and the series of dialogues called *Dell'arte della guerra* complete Machiavelli's political works. In these writings, Machiavelli reveals himself as a pupil of the ancient philosophers, not in regard to his style, whose terse, muscular, and trenchant quality is far from the prevailing classical model, but in his theories of life and government. The theme of *La Mandragola* is as indelicate and comic as that of a tale by Boccaccio and arouses a feeling of amusement tempered by severity. The atmosphere is cynical and sardonic from beginning to end, while the positive thought and lucid style remind us continually of *Il Principe*. In the *Storie fiorentine* we again meet the Machiavellian conception of history as the creation not of the people but of strong personalities.

Colder and more exact are the historical works of Francesco Guicciardini (1483-1540). His *Ricordi civili e politici* stems not from a desire to formulate general rules of human conduct, but from an attempt to describe the myriad variations of human behavior. His historical method is analytical, especially in the *Storia d'Italia*, where he demonstrates an unusual ability to weigh and coordinate the circumstances surrounding a given action and leaves with the reader an impression of wide-ranging vision.

Machiavelli and Guicciardini are both realists. Other writers have left us a more idealistic picture of the 16th century, among them Baldassare Castiglione (1478-1529), whose *Il Cortegiano* is an ample and artistic picture of court life; and Pietro Bembo (1470-1547), whose *Gli Asolani* is an exaltation of Platonic love. These moralists, too, show in their style and their balanced outlook on life the strong influence of the classics. Noteworthy for the same reason are *La prima veste dei discorsi degli animali* by Agnolo Firenzuola (1493?-1545), many pages of Antonio Francesco Doni (1513?-1574), and *La Circe* by Giovanni Battista Gelli (1498-1563).

There is an abundance of Latin writing in the 16th century, but even more remarkable is *Baldus*, a poem by Teofilo Folengo (1496?-1544) written in macaronic or dog Latin, a parody of the classical tongue. (See MACARONIC VERSE.) This poem takes up the cudgels against the courtly and literary life; it embraces nature as opposed to refinement and represents a diametrically opposite view to that of *Il Cortegiano*. Without any intention of parody, Angelo Beolco (1502-1542), known as Il Ruzzante, makes use of the same realistic background in his brief dialect comedies of peasant life. Defiant of convention and often immoral are the copious writings of Pietro Aretino (1492-1556), who is a typical representative of the widespread degeneracy of the age, mirrored less in his comedies than in the huge bacchanalian work called *Ragionamenti*. Benvenuto Cellini (1500-1571) had the same impetuous temperament and left us in his *Vita or Autobiography* the liveliest and most complete picture of the boldness and vanity of a 16th century artist. (See CELLINI'S AUTOBIOGRAPHY.) The comic verses of Francesco Berni (1497-1536) have less intrinsic value, but his style influenced this form of writing for two centuries and we must grant him both cleverness and facility of expression.

Around these important authors is a galaxy of minor figures, chiefly writers of short stories and comedies. Such short story writers as Matteo

Bandello (1480?-1562) and Il Lasca (Antonio Francesco Grazzini, 1503-1584) are followers of Boccaccio; the comedians copy classical Latin models with the addition of contemporary material. *La Veneziana*, of unknown authorship, is by far the best comedy of the 16th century and, with *La Mandragola*, the only one which does not conform to a conventional pattern. Lyric poetry, except for Gaspara Stampa (1524?-1554), Caleazzo di Tarsia (1520-1553), and Michelangelo, is still limited to the forms laid down by Petrarch.

The Age of Tasso.—Toward the middle of the 16th century conscience and taste underwent a revolution. The Counter Reformation called men back to forgotten duties, although men proceeded to perform them mechanically and without enthusiasm. Michelangelo Buonarroti (1475-1564) interpreted in painting the spiritual needs of the time, but no writer gave himself up wholeheartedly to the stern injunctions of the church in its attempt to recover the mastery of men's souls. The only important writers of this period, besides Tasso, were the physicist Giambattista della Porta (1538?-1615), who introduced elements of fancy and imagination into comedy; Giordano Bruno (1548?-1600), who in his philosophical works, particularly *Spaccio della bestia trionfante*, succeeded by means of a grandiose and baroque style in tracing a vast, powerful, and noble conception of the world; and Giovanni Battista Guarini (1538-1612), whose pastoral drama *Il pastor fido* did more than Tasso himself to transform poetry into a musical attenuation of reality.

Torquato Tasso was born at Sorrento in 1544 and lived for some time at the court of the Este family in Ferrara. He was driven to a wandering existence by a restlessness which for several years took the form of insanity, and died at the convent of Sant'Onofrio in Rome in 1595. His *Gerusalemme Liberata* (*Jerusalem Delivered*, q.v.) marks the beginning of a new period of Italian literature, which was to be strongly influenced until after the romantic period by his style and way of thinking and feeling.

Gerusalemme Liberata is a serious and melancholy poem in 20 cantos which portrays in the guise of history Tasso's own frame of mind. It relates, rather than the conquest of the Holy City, the passions of the two Christian heroes, Rinaldo and Tancredi (Tancred). The love story of Rinaldo and Armida occupies most of the poem from Canto IV to Canto XX, while the romantic adventures of Tancredi, which are first mentioned in Canto III, end only in Canto XIX. These two stories form the framework and plot of the poem. Beside the two heroes we have the feminine figures of Armida, Erminia, and Clorinda, who give rise to some of the most famous passages, including Erminia's flight among the shepherds, and Clorinda's death, brought about by a fatal error, at the hands of her lover. A dramatic fatality pervades the whole poem, and even the two pagan protagonists, Argante and Solimano (Suleiman), who do not enter into the sentimental episodes, are seen in a fundamentally melancholy light. There is in *Gerusalemme Liberata* a new feeling for life and nature, quite different from that of *Orlando Furioso* and its time, and expressed in a plaintive style in which words are valued less for their meaning than for their musical quality. The poem was immensely popular. It set the rhythm and style of the poetry of the century to follow, and for over 200 years was a source of romantic

subtleties heretofore unknown in Italian literature.

Tasso's earlier pastoral drama, *Aminta*, a finely balanced compromise between the traditional treatment of a conventional subject and the expression of a dreamy and meditative personality, met with less success. Here his poetic talent was muzzled by the requirements of dialogue, for which he had not yet found the form midway between the dramatic and the lyrical that he used in *Gerusalemme Liberata* for the expression in apparently objective terms of his innermost feelings.

The 17th Century.—In the 17th century poetry, uprooted from reality, became superficial and overrefined and ceased to interpret the life and spirit of the age. It was a mere tour de force, built on rhetorical figures of speech, particularly on complicated metaphors, and on alliteration and other devices related to the music of the period. Lyric poetry adopted new themes, but its departure from tradition was motivated merely by a frivolous desire for the strange and new. Sensuality was pronounced, and there was a taste for description, preferably of luxuriant scenic backgrounds. Religious themes were often marred by the poet's sensuality, yet there was in the 17th century a vein of sincere melancholy arising not only from the stern teachings of the Counter Reformation, but also from the contrasting pomp and theatricality of society and the fine arts. The writer most representative of this religious spirit was Federigo della Valle (1565–1628), whose tragedy *Judit* was the only great work of its kind before Vittorio Alfieri. Tommaso Campanella (1568–1639) was another poet of high moral standards, though more of a philosopher by vocation.

Perhaps the most typical 17th century writer was Giambattista Marini or Marino (1569–1625), who produced a number of poetical works, conspicuous among them *L'Adone*, made up of a plethora of incidents told in the exaggerated and disorderly manner characteristic of the time. Fulvio Testi (1593–1646), more oratorical than poetic, had ideas opposed to those of Marini, and so did Gabriello Chiabrera (1552–1637), a forerunner of the insipid airs and graces of the Arcadian school. A prose writer of the same verbosity as Marini but free of his metaphorical extravagance was Daniello Bartoli (1608–1685), author of *Storia della Compagnia di Gesù*, a long history of the Jesuit order. Giovanni Battista Basile, count of Morone (1575–1632), who wrote entertaining fables in Neapolitan dialect, obtained unusual artistic effects from the flowery imagery proper to the 17th century. Two poems unconnected with contemporary literary trends were the burlesque *La secchia rapita* of Alessandro Tassoni (1565–1635), containing characters and episodes of enduring liveliness; and the dithyrambic *Bacco in Toscana* of Francesco Redi (1626?–1697 or 1698), a lively story of the inebriation of Bacchus.

The more serious side of 17th century literature is represented by the profound and sometimes keen-witted scientific prose of Galileo Galilei (1564–1642), the great opponent of Aristotelian philosophy and the Ptolemaic system, author of *Dialogo dei due massimi sistemi del mondo* and *Il saggiaiore*, and founder of a literary trend as well as a scientific school. Other serious writers were Paolo Sarpi (1552–1623), author of *Storia del Concilio di Trento*; and Traiano Boccalini (1556–1613), whose *Ragguagli di Parnaso*

and *Pietra del paragone politico* were the best political essays of the time.

The 18th Century.—In 1690, there was founded in Rome the Arcadia, an academy whose purpose was to combat the bad taste of the 17th century. This academy held sway for the greater part of the 18th century, steering into oversimplification and impoverishment the idyllic and Anacreontic trend of the school it sought to supplant and accentuating its saccharine quality. The chief exponents of this academic effort were Paolo Rolli (1687–1765) and Carlo Innocenzo Frugoni (1692–1768); its only real poet was Metastasio (originally Pietro Trapassi, 1698–1782), who wrote two restrained and graceful songs and several dramas, including *Didone abbandonata*, *Olimpiade*, and *Demofonte*, in which he endowed poetry with a new and melodramatic tone. Metastasio is the only poet in whom melodrama is not a fault but an original and genuine lyrical expression in which feeling is transformed into song, and melancholy, sorrow, regret, jealousy, and doubt no sooner appear than they vanish in melodious echoes.

There are traces of Metastasio's influence in Carlo Goldoni (1707–1793), the greatest Italian writer of comedy. His comedies are in appearance realistic depictions of the Venetian life of the age, but their realism is filtered through an optimistic and typically 18th century temperament and falls into cadences not far removed from those of Metastasio's melodrama. Goldoni continued Metastasio's gracefulness, enriching it and turning it away from the ancient heroic world toward the middle-class atmosphere of modern times. His plays impress us not as direct reflections of life, but as theatrical fictions based on lifelike models. The best of his comedies, which are written partly in Italian and partly in Venetian dialect, are *I rusteghi*, *La locandiera*, *Il ventaglio*, *Le baruffe chiozzotte*, and *La casa nuova*. Before Goldoni the Italian comic theater was the province of the *commedia dell'arte*, entrusted to the brilliant improvisation of great actors. (See **DRAMA—The Renaissance**.) The *commedia dell'arte* was famous throughout Europe and popularized such figures as Arlecchino (Harlequin), Pantalone (Pantaloon), and Brighella, but with the passage of time it degenerated into buffoonery. Goldoni opposed this tendency with his carefully thought-out comedies drawn from direct observation.

In the second half of the century the academic versification of Arcadia gave way to poetry of a more serious kind. Even Giovanni Meli (1740–1815), the great poet of Sicilian dialect, whose choice of subject matter and background recalls the Arcadian school, followed new and healthier ideals, as if he had been touched by the spirit of Jean Jacques Rousseau. The literature of this period stemmed from a general renewal of culture, as in the work of Giovanni Battista Vico (1668–1744) and Lodovico Antonio Muratori (1672–1750), who marked the revival of the traditional study of philosophy and history and paved the way, each in his own field, for the exact philological and critical scholarship of the 19th and 20th centuries. The decade of greatest interest falls later, from 1755 to 1765, the years dominated and epitomized by Giuseppe Parini.

Between Metastasio and Alfieri a large number of writers, both followers of the Arcadian school and independents—literary critics, moralists, and disseminators of ideas—contributed to a

renewal of literature. Among them we may name Francesco Algarotti (1712-1764), Saverio Bettinelli (1718-1808), Gaspare Gozzi (1713-1786), and, most talented of all, Giuseppe Marc'Antonio Baretti (1719-1789), whose review *La frusta letteraria* opposed the lazy superficiality of Arcadia, and Ferdinando Galiani (1728-1787), the most biting critic of the abstract, antihistorical, and encyclopedic mentality of his time. New ideas were spread by such periodicals as *La frusta letteraria*, Gozzi's *Osservatore veneziano*, and *Il Caffè*, published in Milan and written largely by Pietro Verri (1728-1797) and Cesare Bonesana, marchese di Beccaria (1735?-1794), author of *Dei delitti e delle pene* (1764), which won fame throughout Europe in the field of penology.

Beccaria's influence extended to Giuseppe Parini (1729-1799), who wrote odes of public and personal interest (*Il bisogno*, *A Silvia*, *La caduta*, *Alla Musa*, *Il messaggio*) in a taut and finished style and on a more solid basis than the contemporary neoclassic poets, and a longer free verse poem, *Il giorno* (*The Day*). In this poem the writer pretends to be the mentor of a young man of fashion, and, while instructing him as to how he should pass the day, he satirizes his idle and vicious existence. The picture of society, narrow in the first section, *Il mattino*, is gradually enlarged in the *Mezzogiorno*, *Vespro*, and *Notte* until it comprises a wide variety of aristocratic types and foibles.

The decline of the Arcadian school was hastened by new romantic trends, particularly the melancholy vein of Thomas Gray, Edward Young, and the poems of Ossian (q.v.). The latter were introduced to Italy by the verse translation of Melchiorre Cesarotti (1730-1808).

This, then, was the background of Vittorio Alfieri (1749-1803), whose ideas and temperament, however, make him less a product of his century than a rebel against it, a forerunner of romanticism and the Risorgimento (q.v.) rather than an interpreter of the currents around him. Although Alfieri was brought up in Piedmont, a region where French culture prevailed, he became an enemy of the French; he despised the word philosophy, which was venerated by his contemporaries; he opposed the Enlightenment, and lived in a heroic world of his imagination. His principal works are his *Vita*, an autobiography, and his tragedies. Everything that Alfieri wrote is stripped down to essentials, which means that it is concerned with himself as protagonist, with his stubborn, reserved, and melancholy childhood, his youthful dissipation accompanied by an unconscious and desperate longing for a brilliant future, and the manhood out of which he created some masterpieces of despair: *Saul* (q.v.), *Mirra*, and *Filippo II*. The theme of Alfieri's tragedies is an iron will which is fed by an all-absorbing passion or struggles to escape from its bonds. Their noble tone derives from this element of will, which projects the emotions of a world vaster than our own. Several of the tragedies deal with the passion for freedom and influenced the period of the Risorgimento, but they are his best works from a literary point of view.

Foscolo, Leopardi, and Manzoni.—The pre-romantic themes which influenced Alfieri were enriched in the following years. On the other hand, the vogue of the classics, brought about by the studies of the great German archaeologist Johann Joachim Winckelmann, the ambitions of

Napoleon, and the reaction against Arcadian superficiality, caused a recrudescence of classical forms. Vincenzo Monti (1754-1826), who lived during the zenith of the Arcadia, the influx of nocturnal and graveyard poetry inspired by Ossian, and the revival of classical style and taste (which was nevertheless open to new influences), is the poet most representative of his time. His translation of the *Iliad* is still known today.

The themes which are occasional and uncertain in Monti's poetry become strong and persistent in Ugo Foscolo (1778-1827). Love of country, which was superficial in Monti, is one of the prevailing themes of *Ultime lettere di Jacopo Ortis* (*Last Letters of Jacob Ortis*, q.v.) and *I Sepolcri*; the memory of past grandeur becomes a sacred tradition and the object of a cult; and classicism, which in Monti was mere ornamentation, means to Foscolo a purification of his romantic soul and a sublimation of his own melancholy and unrest in the sphere of an ideal world. Romanticism, which was only an external stimulus to Monti's poetry, takes on in Foscolo a note of profound pathos. Foscolo, the heir to Alfieri's patriotism and romantic feeling, the master of the Risorgimento and of the later poet Giosuè Carducci, and the forerunner of Giacomo Leopardi's pessimistic negation, is akin in his imaginative and melancholy spirit to the romantic poets north of the Alps, and his work forms an integral part of contemporary European literature. This work ranges from *Ultime lettere di Jacopo Ortis*, an early and unorganized but rich explosion of his romantic temperament, to *I Sepolcri*, in which romanticism and the discipline of classical training are perfectly balanced, and to the fragmentary *Grazie*, where classicism takes the upper hand, inspiring passages of exquisite poetry which lack, however, the passion that was the most fertile source of his inspiration. Closer in spirit to the *Grazie* are his two odes, and particularly delicate is the one *All'amica risanata*. Akin rather to *I Sepolcri* are his sonnets, among which *Alla sera* and *In morte del fratello Giovanni* give us a finished poetic portrayal of the writer.

While Monti is the decorative historian of the Napoleonic period and Foscolo its prophetic antagonist, a third poet, who wrote in Milanese dialect, Carlo Porta (1775-1821), is not the mere chronicler that he may appear at first glance, but a vivid painter of the age. He depicts life among the common people, nobility, and clergy and unobtrusively tells in verse of the repercussions of history upon the existence of the ordinary citizen. In the minor writers grouped around these great figures we see the continuation in both poetry and prose of the neoclassic tradition.

Though he belongs to the classical school, Giacomo Leopardi (1798-1837) stands in a category all his own. By virtue of his self-control, the chiseled lines of his poems, and the severity of his form, he is the most classical of Italian lyric poets; the atmosphere of his poems is as limpid and uncluttered as that of *I Sepolcri* is wavering and shadowy. But Leopardi is also influenced by the romantic tradition, whose despair, the *mal du siècle*, was anticipated in Foscolo's *Ultime lettere di Jacopo Ortis*. Leopardi does not belong to the age of Napoleon, but to the following period of depression and pessimism which set in as a reaction to its tumultuousness and was fertile soil for the growth of romanticism. He takes over many of Foscolo's most melancholy themes and early in his career

shuts himself up in a state of grief which reflects not only the unhappiness of his own life but the mood prevalent in contemporary European literature. But Leopardi's despair is not morbid; it assumes well-defined contours and rises to a wider sphere where worldly troubles disappear and melancholy is the product not of human vicissitudes but of a deep feeling for man's inevitable fate. This is the meaning of such lyrics as *L'infinito*, *Canto notturno d'un pastore errante dell'Asia*, *Il sabato del villaggio*, and *La sera del dì di festa*, and the more subjective *A Silvia*, *Le ricordanze*, and *Alla sua donna*. It is, indeed, the significance of all his best poetry, which has as its point of departure the familiar scenes of his native town of Recanati but reaches out into the world. (See also ODES.) The prose *Operette morali* (*Dialogues of Leopardi*, q.v.) are thoughtful rather than sentimental. Their form is either narrative or dialogue, interspersed with imaginative passages which lend a gloomy majesty to the writer's conclusions. They are clear evidence of Leopardi's pessimism and serve as an introduction to his *Storia del genere umano*, a description of man's fatal satiety with the goods of this earth and his consequent state of ennui.

Alessandro Manzoni (1785-1873) is half classical, half romantic, although he is generally known as the leader of the Italian romantic school. An important factor not only in his private life but in his writing was the religious conversion he underwent in 1810. He had received his early philosophical education during the revolutionary period, that is, under the influence of clear, logical, and ironical French culture. His conversion took place at a time when mortal weariness and a wave of intellectual disillusionment were paving the way for the political, philosophical, and literary ideas of the period after Napoleon. The first fruits of his conversion were the *Inni sacri*, greatest among them *La Pentecoste*, and the *Osservazioni sulla morale cattolica*. There is religious feeling in his tragedies, *Il conte di Carmagnola* and the better written *Adelchi*, memorable for the choruses *Dagli atri muscoli* and *Morte d'Ermengarda*.

Manzoni's acknowledged masterpiece, *I promessi sposi* (*The Betrothed*, q.v.), which first appeared in 1825-1827, but is better read in the revised 1840-1842 edition, is based on a Christian concept of life. This novel is the love story of two young peasants whose marriage is opposed by an overbearing petty nobleman, abetted by the brutality and public disasters of the time. The action takes place around the Lago di Lecco and in Milan from 1628 to 1630. These scenes were dear to Manzoni and he displays his affection in mellow descriptions and a wealth of detail concerning everyday life. The period of the novel is made vivid to the reader not only by painstaking though not too obvious research, but also by the writer's extraordinary ability to infuse a rich, lifelike quality of thought and feeling into past events and to master and transfigure them with his own austere moral and religious ideas. Manzoni reconstructs and interprets this period with greater penetration than any of the others he studied. It lends itself to the display of the spiritual and artistic richness of his temperament and offers him numerous and skillfully woven themes illustrative of his irony and melancholy and a view of life which appears optimistic and pessimistic in turn and escapes categorical definition as either, because it has passed beyond senti-

mentality and prejudice and faces the complexities of real life.

Romanticism; De Sanctis.—Romanticism had only a limited influence on Italian literature: it never brought about the complete transformation that took place in other European countries. Italian romanticism restricted itself to a choice of certain themes and to a statement of theories of literature and nationality. In this respect, the most typical writer was Giovanni Berchet (1783-1851), a contributor to *Il Conciliatore*, author of the romantic manifesto *Lettera semiseria di Grisostomo*, and of the poetical works *Romanze* and *Fantasie*. A half patriotic and half satirical poet was Giuseppe Giusti (1809-1850), whose chief concern was with his native Tuscany, as that of the Roman dialect poet, Giuseppe Gioacchino Belli (1791-1863), was with Rome. Historical novels, notably those of Tommaso Grossi (1791-1853) and Massimo Taparelli, marchese d'Azeglio (1798-1866), flourished; they were modeled after Manzoni and had a patriotic and romantic tone. This same tone prevailed in autobiographies and autobiographical novels by such writers as Silvio Pellico (1788-1854), Luigi Settembrini (1813-1877), Giovanni Ruffini (1807-1881), and Ippolito Nievo (1831-1861). Nievo died very young, leaving an enormously promising book, *Confessioni di un ottuagenario*. The writers of the following generation—Giuseppe Mazzini (1805-1872), Francesco Domenico Guerrazzi (1804-1873), and Aleardo Aleardi (1812-1878), were deeply romantic. For some passages of excellent poetry we should mention Giovanni Prati (1815-1884). More complex are the later Lombard poets of an ultraromantic group known as the *scapigliati*, Emilio Praga (1839-1874) and Arrigo Boito (1842-1918). Giacomo Zanella (1820-1888), the meditative poet of *Sopra una conchiglia fossile nel mio studio*, and the series of sonnets, *L'Astichello*, and the poet-novelist Niccolò Tommaseo (1802-1874) hold a place of their own.

The greatest work of the Italian romantic period is that of Francesco De Sanctis (1817-1883), one of the major literary critics of any time and country. Living himself through the crucial period of the Risorgimento, he wrote the first real history of Italian literature.

From Carducci to the Present.—The dominant literary trend of the second half of the 19th century was a reaction to romanticism and a return to a healthier view of life. The lyric tone gave way to the study of contemporary backgrounds and the structure of modern society, and writers dealt with the people around them rather than with their own egos. The theater, in a first, moderate return to the portrayal of actual life, was dominated by Paolo Ferrari (1822-1889), Vittorio Bersezio (1830-1900), and Pietro Cossa (1830-1881). Later, with Giuseppe Giacosa (1847-1906), Giacinto Gallina (1852-1897), Gerolamo Rovetta (1851-1910), and Marco Praga (1863-1929), realism was accentuated into verism, though never exaggerated. In fiction, these tendencies appeared, at least in more important works, only in the verist period, with Luigi Capuana (1839-1915), Emilio De Marchi (1851-1901), and Matilde Serao (1856-1927).

Lyric poetry took an antiromantic and anti-classical turn about 1860, beginning with Vittorio Betteloni (1840-1910) and going on to Lorenzo Stecchetti (pseudonym of Olindo Guerrini, 1845-1916). Later it was absorbed by the *crepuscolare* (twilight) school and the futurists. Giosuè Car-

ducci (1835–1907), a poet of aristocratic temperament remote from everyday life, was the most deliberate opponent of the false and unhealthy side of the romantic movement. His best work is in the two volumes *Rime nuove* and *Odi barbare*. Carducci took his material from history and his own surroundings and wove it into an expression of his balanced and straightforward personality. History, the classics, and his natural youthful exuberance combined to breathe a new spirit into the Italian lyric. He was inspired by the powerful spectacle of the glories of ancient Rome and the medieval Italian communes, by the strength and self-control of the classic writers, and by a vigorous and sympathetic outlook on the life around him. Carducci is the most concrete and nobly realistic of modern Italian poets. The fragrance of the woods and fields and the boundless silence of a southern landscape are all between the covers of his books. After Carducci studies of nature were complicated either by spiritual problems, as in Giovanni Pascoli, or by sensual violence as in Gabriele D'Annunzio.

Giovanni Verga (1840–1922) had a clear and manly view of life, but there was in him a strain of melancholy that Carducci never knew. His theme is the struggle of daily life, played against no majestic background and relieved by no unexpected adventures, but lived out in a mood of uninterrupted and taciturn sorrow. This is the subject of his best short stories—*Rosso Malpelo*, for instance—and his most successful novels, *I Malavoglia* and *Mastro don Gesualdo*. *I Malavoglia* is the story of a family that goes through endless trials with the weary and persistent hopefulness of the truly unfortunate. It is the first great example of the passage of the Italian novel from an epic to a lyric manner. *Mastro don Gesualdo*, less unified and more varied, tells of a man who rises by sheer tenacity from poverty to wealth, struggling against the envy, mistrust, and pride of both the aristocrats to whom he relates himself by marriage and the poor people with whom he grew up and whom he hopes to help. At the end of the book the hero is alone and forgotten. (See also CAVALLERIA RUSTICANA.)

Italian realism assumed a strictly regional character; it was Sicilian in Verga and Capuana, Tuscan in Renato Fucini (1843–1921), Neapolitan in Matilde Serao, and Sardinian in Grazia Deledda (1875–1936). Other regional works were the musical and melancholy poems in Neapolitan dialect of Salvatore di Giacomo (1862–1934) and the Roman poems of Cesare Pascarella (1858–1940).

Benedetto Croce (1866–1952) is an able critic of this period as well as a writer of clear and harmonious style. He is closer to Carducci and Verga than he is to the romantic soulfulness, mysticism, and decadent qualities of the writers making up the following Italian literary school: Antonio Fogazzaro, Arturo Graf, Giovanni Pascoli, and Gabriele D'Annunzio.

Antonio Fogazzaro (1842–1911) attempted to give spiritual guidance to those who were torn between science and religion, but he was not equal to this difficult task. He was sensitive, given to lofty feelings, and inclined to hear in nature the voice of a spirit mysteriously akin to that of man. This inclination is apparent to an overpowering degree in *Malombra*, an overly intricate and tempestuous novel which is an accurate reflection of Fogazzaro's own temperament. *Piccolo*

mondo antico (*The Little Old World*, q.v.), in which his contradictory impulses are better balanced, is more clear-cut. The scene of this novel is laid in places which Fogazzaro remembered from his childhood, and the plot is concerned with incidents of the time of the Risorgimento of which he had heard at first hand during the youthful years he spent in Turin.

Arturo Graf (1848–1913), like Fogazzaro, belongs to the movement of reaction against realism. His poetry begins with the bewilderment of a lost soul and eventually rises to a tragically religious note.

Giovanni Pascoli (1855–1912) was another opponent of realism, dominated by a sense of the mystery that surrounds and governs human life. From this sense of mystery comes a resignation to evil which amounts to passivity and may perhaps be attributed to the influence of Leo Tolstoy, just as his perplexity in the face of the problem of evil seems to derive from Fyodor Dostoyevsky. Such an ethical stand on the part of a contemplative nature like that of Pascoli necessarily led to the solitary, meditative, and bewildered attitude which he assumed toward life. His inner confusion pours itself out most naturally in the silent countryside where it is easiest to hear the mysterious voice of nature. His best collections of verse are *Myricae*, *Canti di Castelvecchio*, *Primi poemetti*, and *Poemi conviviali*. In Fogazzaro and Pascoli alike there is something effete, a weak moral fiber, a surrender to the feeling of mystery, a submission to the irrational, and hence an increase in the musical quality of their poetry to the detriment of line and construction—all qualities characteristic of decadence.

This trend culminated in Gabriele D'Annunzio (1863–1938), in whom were inextricably mingled the temperament of a Renaissance nobleman and that of a modern decadent, avid for subtle new sensations and intent on grafting obscure and magical meanings onto the appearances and events of life. D'Annunzio was prey to a fundamental dualism, torn between heroism and decadence, epic violence and heedless frivolity. The essence of his poetry, in the lyrics of *Alcione*, the tragedy *La Figlia di Jorio*, and the best pages of his novels—*Il Piacere* (q.v.), *Il trionfo della morte*, and *Il fuoco*—is gloomy, nervous, and ultraromantic. Although D'Annunzio's writing is quite frequently sensual in the extreme, we see him at his best carried away by music and suffering, lost in an ecstatic adoration of beauty, wondering at the discontent engendered by the enjoyment of beauty, and eager, all in vain, to penetrate its secret. (See also FRANCESCA DA RIMINI.)

Italian poetry has remained more or less derivative from Pascoli and D'Annunzio. This is true of Guido Gozzano (1883–1916), whose illness and consequent scepticism toward heroic ideals made him the most notable representative of the *crepuscolare* school, and it is equally true of futurism and pure poetry. Strictly Italian influences have been tempered by those of Georges Rodenbach, Walt Whitman, Émile Verhaeren, Stéphane Mallarmé, Arthur Rimbaud, Paul Valéry, and others. Among living poets, Eugenio Montale (1896–) is worthy of mention, and the most profound of all is Umberto Saba (1883–).

Among modern prose writers, Aldo Palazzeschi (1885–), author of *Stampe dell'Ottocento* and *Sorelle Materassi*, belongs in some ways to

the *crepuscolare* group but has a vein of mingled pathos and comedy all his own. *Rubè*, a novel by Giuseppe Antonio Borgese (1882–1952), is typical of the disillusionment following World War I. Emilio Cecchi (1884–) is an ultraromantic who has written some of the most brilliant pages of Italian prose. Antonio Baldini (1889–) and Riccardo Bacchelli (1891–) belong to no particular school; the latter has a talent for the sensory and concrete. Important anti-Fascist writers are Gaetano Salvemini (1873–1957), historian, and Carlo Levi (1902–), author of *Cristo si è fermato ad Eboli* (*Christ Stopped at Eboli*), one of the most interesting of the post-World War II writers. Among the younger writers of note are Vitaliano Brancati (1907–), and Elio Vittorini (1908–), whose novels have appeared in English translation.

Perhaps the two best-known 20th century writers after D'Annunzio are Alfredo Panzini (1863–1939), whose prose contains varied and skillfully handled themes, half scholarly and half frivolous, as in *La Lanterna di Diogene*; and Luigi Pirandello (1867–1936), author of many short stories, one remarkable novel (*Il fu Mattia Pascal*), and a number of plays whose desperate and harrowing themes, well suited to the modern temper, have secured their performance all over the world. (See also separate biographies of important authors; NOVEL, THE; and DRAMA.)

Professor of Italian Literature, University of
Florence.

6. THE ARTS. The first Christian art in Italy resembled closely the contemporary late Roman work. Like the pagan pictures, of the time, the paintings in the catacombs of Rome were done with a series of rapid strokes of the brush and very little shading against a light background. They were, however, distinguished by a new and largely symbolic iconography. Among the commonest of the symbols used were fish, ships, and vines. The sculpture of the period, consisting largely of bas-reliefs on sarcophagi, of which there are fine examples in the Lateran Museum, shows the same Roman Empire style.

EARLY CHRISTIAN AND BYZANTINE ART

After 313 A.D., when Constantine issued the Edict of Milan, granting legal status to the Catholic Church, architecture began to develop along new lines. This date marks the beginning of a new Christian art with forms of expression distinct from those of the ancient world.

Early Christian Churches.—In the fourth and fifth centuries, Rome was the chief artistic center of Italy. Among the great basilicas built in the city at this time were Old St. Peter's, which was later destroyed and rebuilt in the Renaissance; St. John Lateran, which we see today in baroque dress; Santa Maria Maggiore, the best preserved of all; St. Paul's Outside the Walls, which was rebuilt in the 19th century; and Santa Sabina, with its fine wooden doors. Circular buildings were also characteristic of the time: Mausoleum of Santa Costanza; Baptistery of the Lateran; Santo Stefano Rotondo. Mosaic decoration of interiors became common, and we have examples in Santa Pudenziana, Santa Maria Maggiore, Santi Cosma e Damiano, and Sant' Agnese.

The Byzantine Period.—The mosaics of Sant' Agnese in Rome date from the 7th century and show an increasing Byzantine influence. A new mystical spirit made for new forms of expression. Art abandoned the imitation of nature;

images lost their bodily mass, and colors were laid on a flat surface and were brightened in such a way that they gave an immaterial vision of light.

The chief monuments of the Byzantine period are at Ravenna, which was the capital of the Byzantine exarchate from the 6th to the 8th centuries (see section on *History*). Among them are the Mausoleum of Galla Placidia, the Baptistery of the Orthodox, Sant' Apollinare in Classe, Sant' Apollinare Nuovo, and San Vitale, all decorated inside with brilliant mosaics.

Sculpture veered away from prominent relief and effects of mass, and we see it flattened out on the sides of sarcophagi (many of which are found in Sant' Apollinare in Classe), or turned into the lacework of capitals and screens and the carving of pulpits and bishops' chairs. Other works of the Byzantine period survive in Naples and Milan.

THE ROMANESQUE PERIOD

The Romanesque period of Italian art lasted from the late 8th century to the early 13th century. The first part of this period, ending in approximately 1000 A.D., is known as early or pre-Romanesque.

Early Romanesque.—The monuments of this time are fewer in number than those of the Byzantine period, mixed in style, and imprecisely dated. Architecture and sculpture drew further away from the Byzantine tradition than did painting. The structures, scattered all over Italy, of the *maestri comacini*, who probably came from the Lago di Como region, derive many of their features from Byzantine architecture, but there is a changed relationship among them. They are heavier and thicker than the Byzantine churches, with brick walls that are interrupted by slit windows which admit little light. Churches of this type include San Pietro, Tuscania; San Salvatore, Brescia; the apse and presbytery of Sant' Ambrogio, Milan; and the baptisteries of Biella, Agliate, and Galliano. In Rome, on the other hand, the harmoniously proportioned basilicas of the 9th century—Santa Maria in Domnica and Santa Prassede, with its chapel of San Zenone, all decorated with mosaics, together with Santa Maria in Aracoeli—bear witness to the survival of a local architectural tradition of the early Christian period.

Since the churches are almost completely devoid of sculpture, we must look for the plastic arts of the time in carved capitals, baptismal fonts (Cathedral of Cividale, 8th century), ciboria (Sant' Apollinare, Ravenna), screens, and pulpits and above all in the work of goldsmiths, one of whose most notable examples is the altar by Vuolfvinio (Vuolfvinus) in Sant' Ambrogio, Milan, reminiscent of the Carolingian style.

In the Eastern Roman Empire, Byzantine art still prevailed, conserving its almost religiously set color values, its technical sumptuousness and refinement, and a progressive rigidity of both iconographic and stylistic themes. But in western Europe—France, the Rhineland, Ireland, Spain, and northern Italy—a new form of art was born, rising out of the Byzantine tradition, but branching away from it by virtue of greater feeling and inventiveness, the absorption of barbarian decorative motifs, and a renewal of plastic values. Italian art of these centuries represents one phase of this international picture. This process developed in richness and multiplicity during the Ro-

manesque period proper, which extended in Italy from about 1000 to 1200 and beyond.

Romanesque Art.—*Architecture.*—Romanesque architecture varies greatly from one part of Italy to another. Its style is most homogeneous in the Lombard sector, which covers Lombardy (Sant' Ambrogio, Milan; San Fedele, Como; San Michele, Pavia; and the Cathedral of Cremona); Piedmont (Monastery of San Michele, Val di Susa); Emilia (the cathedrals of Modena, an especially fine example; Parma, with its baptistery; Piacenza; Fidenza; Ferrara); and along the Adriatic coast. The architecture of this area is characterized by organic construction, vaulted ceilings, pilasters, arches, effects of mass and of light and shadow obtained by the use of bricks, deeply recessed portals, pillars standing in relief against the walls, blind arcades, porches, and rose windows. These characteristics are found with some local variations in churches of Marche (San Ciriaco Cathedral, Ancona); Umbria (San Rufino Cathedral, Assisi; San Pietro, Spoleto), where there are traces of influence from Latium; and Apulia (San Nicola, Bari; cathedrals of Trani, Troia, Bitonto, Barletta, and Altamura), where the Lombard style is mingled with Pisan, Norman, and Arab elements. In Rome and Latium, there prevailed the tradition of the Cosmati family, whose simple and serene churches remind us of early Roman forms, ornamented with a typical surface decoration of *tesserae* or plaques of colored marble in geometric patterns, as in the cloisters of St. John Lateran and St. Paul's Outside the Walls. In the Romanesque buildings of southern Italy, the mixture of Lombard, Norman, and Arab influences produced fanciful effects: cathedrals of Caserta Vecchia, Benevento (completely ruined in World War II), and Amalfi; and San Pantaleo, Ravello. Sicily was subject primarily to Arab influence, as is seen in the cathedrals of Cefalù and Monreale, with its magnificent cloister, and the Zisa of Palermo.

In western Venetia the Lombard influence was paramount (San Zeno and the Cathedral of Verona), but in the city of Venice the Byzantine tradition persisted in an elaborate and refined form: witness St. Mark's with its oriental cupolas, mosaics, and marble incrustations. In Tuscany the Florentine style was distinguished by a harmonious simplicity of structure and by the ornamentation of large surfaces with marble plaques in two colors and a geometric design: Baptistery of Florence; San Miniato al Monte, near Florence and the Abbey of Fiesole. In Pisa construction was more complex, and the most striking local characteristic is the superposition of external porches. The cathedral, begun in 1118, with its baptistery and bell tower, served as a model for many other churches outside the immediate region—San Martino, San Frediano, and San Michele, all in Lucca, where there was some infiltration from Lombardy—and for structures in Corsica, Sardinia, and even Apulia.

Sculpture.—Sculpture flowered along with architecture, and there was a rebirth of plastic feeling. It was sculpture that animated the façades, doors, and capitals of the churches, drawing inspiration from flowers and animals, but also emancipating itself from naturalism in order to create fantastic monsters and designs which blended with the architectural scheme. Plastic representations of the works and virtues of man, the months, planets, and signs of the zodiac—a

whole illustrated encyclopedia was unfolded before the eyes of the faithful. Sculpture is most abundant where architectural forms are most complex and massive, and less evident where flat surfaces and marble incrustations prevail, as they do in Florence, Rome, and Latium.

The first identifiable Romanesque sculptors are Viligelmo, who created the bas-relief stories from Genesis on the façade of the Cathedral of Modena (beginning of the 12th century); Niccolò, who decorated the façade of the Cathedral of Ferrara in 1135; and Benedetto Antelami (fl. 1177-1233), greatest of the three, who carved the *Deposition* in the Cathedral of Parma (1178) and the decorations of its baptistery (1196). The figures of prophets on the outside of the Cathedral of Fidenza are close to Antelami, if not by him. There are also many anonymous sculptures of high quality in the Cathedral of Modena; San Michele, Pavia; the Cathedral of Cremona; and San Zeno, Verona, with its 12th century bronze door.

In Tuscany much activity centered around the atelier of the Cathedral of Pisa. Maestro Guglielmo (William of Innsbruck), its chief artisan, did the old pulpit, which is now at Cagliari, in 1159. There is a notable stylistic resemblance between him and his Lombard and Provençal contemporaries, and he was the originator of a trend that held the field for over 100 years in Tuscany, with Gruamonte, Biduino, and Guido da Como.

In Pisa, after Maestro Guglielmo, Bonanno (Bonannus) held sway. His style was more decorative and nearer to the Byzantine model, as is seen in the bronze doors of the cathedrals of Pisa and Monreale (1186). There is an even stronger Byzantine influence in the reliefs on the main portal of the Baptistery of Pisa. In Lucca sculpture had a more Lombard Romanesque character, as in Guidetto's sculpture on the façades of San Martino (1204) and San Michele, and the scenes from the lives of St. Martin and St. Regulus under the portico of the cathedral. In Tuscany and Latium there was considerable sculpture in wood: Depositions (Tivoli, Pescia, and Volterra); crucifixes (Petrognano); and groups of the Virgin and Child. In the south sculpture flowered along with architecture, exhibiting a mixture of varied elements, particularly imagination: the portals at Troia and Trani; the bronze doors at Trani (by Barisano da Trani), and at Benevento (destroyed in World War II); the pulpits at Ravello, Salerno, and Sessa Aurunca; and everywhere carved capitals (notably beautiful in the cloisters of Cefalù and Monreale), friezes, doorposts, and bishops' chairs. Perhaps it was in the south, where Emperor Frederick II favored everything classical, that Italian Romanesque sculpture had its last resurgence before the advent of the Gothic, and that Nicola Pisano found his models.

Painting.—There are fewer examples left of Romanesque painting, but we can see that in this branch of art the Byzantine tradition lasted longer, especially in Venetia (mosaics of St. Mark's and the Cathedral of Torcello) and Sicily, where it is mingled with Arab themes (mosaics of the cathedrals of Cefalù and Monreale, and the Palatine Chapel in Palermo). In Latium we can still see numerous frescoes of the 11th and 12th centuries: Lower Church of San Clemente, Rome; Sant' Elia, near Nepi; Monastery of Grottaferata; and San Silvestro, Tivoli. Even more im-

pressive are those of Sant' Angelo, Formia (11th century). There are scattered Romanesque frescoes in all parts of northern Italy: crypt of the Cathedral of Aquileia; San Pietro, Civate; San Michele, Oleggio; Baptistery of Parma. The mosaics in the Baptistery of Florence are of a later date, having been begun in 1225. The newest accent in the language of Romanesque painting is found in miniatures. Among paintings on wood there are numerous crucifixes, one of the finest of which is in the Cathedral of Sarzana. In Sant' Agata, Cremona, there is a fine but almost unknown painting of St. Agatha.

At the beginning of the 13th century we can begin to distinguish the first Tuscan painters: Berlinghiero Berlinghieri, first mentioned in 1228, and Bonaventura Berlinghieri (1235), of Lucca, Giunta Pisano (fl. 1229-1254), Margheritone di Arezzo (mentioned in 1262), and Coppo di Marcovaldo, who worked in Florence from 1260 to 1271.

GOTHIC ART

Architecture.—Gothic architecture, which originated north of the Alps, began to penetrate Italy at the beginning of the 13th century. The first Italian Gothic buildings were Cistercian abbey churches: Fossanova (1208) and Casamari (1217), in Latium; San Galgano (begun in 1227), near Siena; Chiaravalle, near Milan; and Sant' Andrea, Vercelli. The principles of Gothic construction spread rapidly in Italy, but proportions differed from those of northern Europe, and there was not the same predominance of vertical lines. Italian builders preferred a more serene harmony between height and width and never attained the prodigious lacework of the northern Gothic cathedrals and their miracles of stained glass. The only exception is the Cathedral of Milan, which was begun very late, in 1386, with the aid of architects from beyond the Alps.

The rise during the 13th century of two religious orders, the Franciscans and Dominicans, stimulated the building of churches all over Italy, most of them in the Gothic style. Among them are San Francesco of Assisi (1228-1253); San Francesco (partly ruined in World War II) and San Domenico, Bologna; San Francesco of Arezzo; Santa Maria Novella (apparently begun in 1278) and Santa Croce (1294), Florence; and Santa Maria sopra Minerva, Rome. Three large cathedrals were also constructed in Gothic style: Siena, which went over into the following century; Santa Maria del Fiore, Florence, which was begun by Arnolfo di Cambio, probably the same as Arnolfo da Firenze (1232?-1302), in 1296; and Orvieto, begun around 1285.

Many nonecclesiastical buildings date from this same period. Their style is massive and closed in Florence (Palazzo Vecchio and various houses [many destroyed] and towers), winged and lacy in Venice (Ducal Palace). Almost every Italian city built a town hall at this time, and that at Piacenza is one of the most beautiful.

Early Gothic Sculpture.—Sculpture, too, took on new forms. After the middle of the 13th century the striking personality of Nicola (or Niccolò) Pisano or d'Apulia, who was both architect and sculptor, the master and teacher of the Pisan school, came into view. It is uncertain whether he received his early training in Tuscany or in southern Italy. There are many Tuscan elements in his style, but he must have been acquainted with the art that flourished at

the court of Frederick II in Palermo, the most cultivated in Italy. The head formerly on a gate and now in the Museum of Capua, the heads on the keystones of Castel del Monte near Adria, and the pulpit of Ravello appear to antedate but foreshadow Nicola's style. The first work that can be definitely attributed to him is the pulpit in the Baptistery of Pisa (1260), a massive, hexagonal piece supported by strong columns and arches and covered with sculpture. On its five panels is portrayed the cycle of the Redemption, from the Nativity to the Crucifixion and Last Judgment. The numerous figures stand out in powerful relief among deep shadows, with the folds of their garments as taut as nervures. There is growing pathos and an expansion of thick and heavy forms from Nativity to Crucifixion, and this is the subsequent direction taken by Nicola's style, as we see it in the pulpit of the Cathedral of Siena (1265-1268). Here he worked with his son Giovanni Pisano and with his pupils, Arnolfo di Cambio, Lapo, and Donato di Ricevuto. But the master's imprint is the strong unifying force, even if we see distinct traces of his assistants, especially Giovanni and Arnolfo, in some bas-reliefs. Another joint effort of the Pisan school is the tomb of St. Dominic in Bologna (c. 1264-1267), where Arnolfo's personality is more easily recognizable than in Siena.

After Siena, Arnolfo left Nicola's workshop, while Nicola and Giovanni went on working together and jointly signed the splendid Fountain of Perugia (1278). From 1284 to 1299, Giovanni worked at the Cathedral of Siena, and in particular on the lower part of the façade, with its three portals and the large statues on the cornice, which make of it the first Italian cathedral as peopled with sculptured figures as the French churches, but whose sculpture is more independent of the architectural framework. Between 1294 and 1299, Giovanni divided his time between the Cathedral of Siena and the Baptistery of Pisa, on which he had already collaborated with his father. These works were followed by the pulpit of Sant' Andrea (1301), Pistoia; that of the Cathedral of Pisa (1302-1310); and the tomb of Margaret of Luxembourg (1313), now in a fragmentary state in the Museum of Genoa. Nor must we forget the splendid groups of the Virgin and Child which we see in the Campo Santo and in Baptistery of Pisa, in the Scrovegni or Arena Chapel at Padova (Padua), and in the Cathedral of Prato (c.1317). Giovanni was as great an artist as his father was, but in an entirely different manner, more rapid and abrupt, more Gothic. He abbreviated forms by summarizing them in a single gesture and accentuated their expressiveness by the deeply cut outlines made by his chisel, creating a tense and dramatic effect.

We find the third master of the Pisan school, Arnolfo di Cambio, 10 years after his collaboration on the Cathedral of Siena, working in 1277 in the service of Charles I, king of the Two Sicilies, at Rome. Until 1295 he stayed on for the most part in Rome, where his works include the tomb of Cardinal Annibaldi in St. John Lateran, the crib of Santa Maria Maggiore, the tomb of Boniface VIII, the ciboria of St. Paul's Outside the Walls (1283), and Santa Cecilia in Trastevere (1295). In 1277 and in 1281 he was apparently in Perugia (there are fragments of a fountain and the headless statue of a scribe in the museum there) and Orvieto, where he did

the tomb of Cardinal de Braye in the Church of San Domenico. From 1296 until his death in 1302 he worked on the Cathedral of Florence, particularly the sculpture on its façade. Where Giovanni was nervous, dramatic, and immediate, Arnolfo was crystal clear and almost architectural in his forms. Modern art criticism has stressed the relationship between Arnolfo and the painter Giotto in values of volume and space.

Early Gothic Painting.—A new style was inaugurated in painting after the first great cycle of Pisan sculpture was over. The Florentine Giovanni Cimabue (properly Cenni di Pepo, fl. 1272-1302) and the Siennese Duccio di Buoninsegna (fl. 1278-1319), great masters as they are, were still linked to the Byzantine tradition. Cimabue's painting is more gaunt and severe with traces of the Romanesque, while Duccio is richer in color and ornamentation, with wavy lines reminiscent of the Gothic. Cimabue's main works are the grandiose frescoes of San Francesco of Assisi; the crucifixes of San Domenico, Arezzo, and Santa Croce, Florence; and the *Madonna Enthroned* of the Uffizi Gallery, Florence. Those considered Duccio's are the *Rucellai Madonna* in Santa Maria Novella, Florence, and the small *Virgin of the Franciscans* in the Siena Gallery. His only authenticated work, however, is the *Maestà* (*Madonna in Majesty*) of the museum of the Cathedral of Siena, dated 1308, with the life of Christ on the back, many pieces of which are scattered in foreign museums. Between these two masters we must mention an anonymous painter of Pisa, who did the fine *Madonna Enthroned* and *St. Martin* of the Pisa Civic Museum. In Rome, Pietro Cavallini, the painter to whom we owe mosaics of Santa Maria in Trastevere (1291) and the frescoes of Santa Cecilia (c.1295), left the Byzantine tradition behind him and achieved powerful chiaroscuro effects and majestic poses reminiscent of ancient art.

Giotto di Bondone (1276?-?1337), of Florence, transformed the style of painting "from Greek to Latin"—that is, into something truly Western. His contemporaries were quick to acclaim his greatness. Giotto was concise and intense; he was concerned with the human body in action, and he built basic forms of clearly defined volume with expressive gestures and positions, relinquishing the splendor of Byzantine colors in order to secure the dominance of chiaroscuro masses, and limiting his backgrounds to a few synthetic and unadorned elements. His chief works are the St. Francis cycle in the Upper Church of San Francesco of Assisi; the fine painting *Madonna Enthroned*, which is now in the Uffizi Gallery; the frescoes of the Scrovegni Chapel in Padova (c.1303-1305); the crucifix, in Santa Maria Novella, Florence; and the frescoes in the Bardi and Peruzzi chapels in Santa Croce, Florence. The last two were painted about 1320, and his outlook is more peaceful and there is a greater impression of space. Giotto worked also in Rome (mosaic, *La Navicella*, or *St. Peter's Ship*, in the entrance of Old St. Peter's, of which only fragments remain), and in Milan, Rimini, and Naples, leaving a strong influence behind him in each city. In his later years he was an architect. He began the campanile of Florence Cathedral in 1334 and raised it as high as the second story.

Giotto's followers were Taddeo Gaddi (fl. 1322-

1366); Bernardo Daddi (d. 1348); the great Maso di Banco (mentioned 1341-1350), who did the frescoes portraying St. Sylvester, notable for their limpidity, in Santa Croce; and Giotto (mentioned 1368-1369). In the latter 14th century the most important Florentine painters were Andrea Orcagna (real name Andrea di Cione, 1308?-1368), and his brother Nardo (d. 1365 or 1366). A noteworthy monument of 14th century Florence is the fresco decoration of the Cappellone degli Spagnuoli by Andrea da Firenze (fl. 1343-1377).

At this time, Siena was the center of another important school of painting, richer in color and ornamentation than that of Florence. Simone Martini (c. 1284-1344), who probably studied with Duccio, painted in bright colors against a gold background and drew figures whose bodily form is barely indicated by a slender *chiaroscuro* under draperies that flow in delicate linear arabesques. His chief works are the *Maestà* (1315) and the portrait of Guidoriccio da Fogliano, in the Palazzo Pubblico of Siena; *Louis of Toulouse Crowning His Brother Robert of Naples*, in the Naples Gallery (1317); the Sant' Ansano *Annunciation* in the Uffizi Gallery (1333); and the frescoes portraying St. Martin, in the Lower Church of San Francesco of Assisi. After 1339 he was at Avignon, and the work he did there, which is largely lost, had great influence in France and laid some of the groundwork for the so-called international Gothic style.

The brothers Pietro Lorenzetti (also called Pietro Laurati or Laurati da Siena, first dated work 1315-d.-1348) and Ambrogio Lorenzetti (Ambrogio di Lorenzo, mentioned 1332-d.-1348) are more plastic than Simone but more ornate than Giotto. They drew lines around their figures to bring out their depth, and both of the brothers, but especially Ambrogio, had splendid rhythms. Many of their paintings are to be seen in the churches and galleries of Siena, Florence, Vico l'Abate, and other cities. Pietro did frescoes in the Lower Church of San Francesco of Assisi, and Ambrogio in the Palazzo Pubblico of Siena (allegory of *Good and Bad Government*).

Northern Italy, too, had important though lesser known schools of painting in the 14th century. Giotto's influence was felt, but it was transformed by a more empirical, intimate, and narrative local tradition. Among the fine frescoes extant in Lombardy are those at Viboldone, Solaro, Chiaravalle, Vertemate, and Mocchirolo. A leading artist of Lombardy was Giovanni da Milano (fl. 1350-1369), who came there after his Florentine period (1350-1366), during which he had painted the frescoes of the Rinuccini Chapel in Santa Croce.

In 14th century Padova there was a lively and original group of artists, including Guariento, a pupil of Giotto; Giusto di Giovanni di Menabuoi of Florence (d. before 1393), author of the series of frescoes in the baptistery and of those, unfortunately now destroyed, of the Palazzo del Podestà and the Eremitani, with their strictly theological themes; and, a little later, Altichiero or Aldighero da Zevio (1330?-1400) from Verona together with his assistant, Jacopo Avanzo, who collaborated on the frescoes of Sant' Antonio and the oratory of San Giorgio (after 1377). Giotto's stay in Rimini gave rise to a local school of painting, which in its turn influenced a school of Bologna, whose major exponent was the sensitive and clever Vitale Cavalli (mentioned 1334-

1359). Tommaso da Modena (c.1329-1379) had some stylistic resemblance to Vitale, but a different personality, for he was gifted in characterization rather than imagination. He did the frescoes of *Dominican Monks* in the chapter house of San Niccolò at Treviso and the stories of St. Ursula in the museum of the same city. Meanwhile in Venice the Byzantine tradition still prevailed, exemplified by Maestro Paolo and Lorenzo Veneziano (fl. 1356-1379).

Later Gothic Sculpture.—The Pisan school of sculpture continued in the first half of the 14th century. In Naples its tradition was carried on by Tino di Camaino (fl. 1312-1337) of Siena, a pupil of Giovanni Pisano, who was active in Pisa, Siena, and Florence. His Neapolitan works (1325-1337) are the Anjou tombs in Santa Chiara and Santa Maria Donna Regina. In Milan Giovanni di Balduccio of Pisa was author of the tomb of St. Peter Martyr, in Sant' Eustorgio (1339). Of a style akin to that of the Pisan school are many early 14th century sculptures in Umbria, among which the most splendid are those on the façade of the Cathedral of Orvieto, attributed to Lorenzo Maitani, who was the superintendent from 1310 to 1330, and those at Ramo di Paganello.

We may relate to these sculptures the obscure origins of Andrea Pisano (also called Andrea da Pontedera, died in 1348), whom we find for the first time in his maturity at Florence in 1330, charged with the execution of the bronze doors of the baptistery, where he carved the story of St. John the Baptist and the cardinal virtues. Andrea shows keen awareness of linear rhythm in his flowing robes, but the most conspicuous parts of his bodies are carved in a refined, synthetic archaic style. Andrea was certainly acquainted with the French art of his time, but he must also have learned from Giotto a new kind of composition and space relationship, which he softened in adapting it to his own talents. The work of these two artists crossed in the campanile of Florence Cathedral, where Andrea Pisano succeeded Giotto as superintendent and, with some assistance, carved most of the bas-reliefs of the lower part of the tower, which represent the story of Genesis and the mechanical arts. According to tradition, these were first sketched by Giotto, who is supposed to have carried some of them out, but this is a controversial and unsupported claim. The bas-reliefs of *Weaving*, *Horseback Riding*, *Hercules and Cacus*, *Navigation*, and *Agriculture* are among the finest ever produced in Italy. In 1347-1348, Andrea was in charge of the Cathedral of Orvieto. He was succeeded there by his son Nino (died in 1368), a graceful but somewhat artificial sculptor (*Madonna* in Santa Maria Novella, Florence; Cornaro tomb in Santi Giovanni e Paolo, Venice).

After Andrea Pisano, the leading place in the field of Florentine sculpture passed to Andrea Orcagna, who carved the tabernacle at Or San Michele (1358-1360). In Pavia, Milan, and Verona (della Scala or Scaligeri tombs), we find the Maestri Campionesi; in Venice, the brothers Jacobello (mentioned to 1409) and Pier Paolo (d. 1403) dalle Masegne (statues of the rood screen of St. Mark's, c.1394), which are in the most ornate Gothic style.

Later Gothic Painting.—The ornate Gothic style, called international because of the common characteristics it had in various parts of Europe, was marked by a progressive diminution

of plastic forms and an overabundant development of rhythmically flowing draperies. This style is considered predominantly northern, but the two greatest painters are the Italians Gentile da Fabriano and Pisanello.

Gentile da Fabriano (real name Gentile Massi, died in 1427) came from Marche, where the Gothic style had been made widely known. He worked all over Italy, but particularly in Venice and Rome. Unfortunately, neither his frescoes in the Ducal Palace nor those in St. John Lateran have survived. Such of his paintings as do remain prove him to have been a master of the delicate touch: *Adoration of the Magi* (Uffizi Gallery), and Madonnas of Orvieto, Milan, and the National Gallery, London.

Antonio or Vittore Pisano (il Pisanello, b. before 1395-d. 1455), was trained in the school of Verona (of which the chief figure was Stefano da Zevio, c.1374-1451), which was characterized, like all Lombard painting of the first half of the 15th century (for example, Giovannino de' Grassi, died in 1398; the brothers Zavattari; Bonifazio Bembo; Michelino da Besozzo), by an ornate Gothic style, but he was also inspired by Gentile da Fabriano. The works of Pisanello still preserved include the frescoes of San Fermo (*Annunciation*) and Sant' Anastasia (*St. George and the Princess*), Verona, *Portrait of a Princess* in the Louvre, Paris, *Lionello d'Este* in the Accademia Carrara at Bergamo, and a considerable number of fine drawings. Pisanello was also an excellent engraver and coined medals and medals for all the princes of Italy.

In Venice, too, painting continued to be in an ornate Gothic style despite a few hesitant foreshadowings of the Renaissance. The greatest masters were Antonio Vivarini (Antonio da Murano, died 1476-1486), who painted the *Madonna Enthroned* (1446) in the Venice Academy in collaboration with Giovanni d'Alemagna (fl. 1440-1447), a triptych at San Zaccaria, and various Madonnas; and Iacopo Bellini (c.1400-c.1470), who is represented by Madonnas in the Louvre, the Venice Academy, and the Uffizi Gallery, and by sketchbooks in the Louvre and the British Museum. Vivarini and Bellini were the respective heads of two families that divided the field of Venetian painting between them.

Even in Florence, both Lorenzo Monaco (called Don Lorenzo, c.1370-1425) and Masolino da Panicale (1383?-1447), who has been identified with Tommaso di Cristoforo Fini, were essentially Gothic. But here it was, while the rest of Italy continued for a number of years to follow the late Gothic style, that at the beginning of the 15th century three major artists—Filippo Brunelleschi, Donatello, and Masaccio—brought about a revolution in style that developed into the Renaissance.

THE RENAISSANCE

The Renaissance period of Italian art extended from the early part of the 15th century to the latter part of the 16th century. In the early Renaissance, Florence was the leading artistic center of Italy. Later, Rome was pre-eminent, and then, Venice.

Early Florentine Architecture.—Filippo Brunelleschi or Brunellesco (1377?-1446) was not only the greatest Italian architect of the 15th century, but also the first to establish the scientific theory of perspective, which, when applied to the arts, became the basis of Renaissance style.

All during the 14th century a feeling for space had been notable in the Florentine school, but this was largely a matter of intuition. Through the use of perspective, spaces could be constructed geometrically, with harmoniously proportioned partitions. Brunelleschi's buildings are the most enlightening example of this development. From the outside they show a clear outline of volumes, while within a large, unencumbered space gradually unfolds before the eye in the rhythm of various planes and a succession of pauses. Together with this impression of space, Brunelleschi's buildings retain the almost elastic tension of the Gothic style and the slenderness and movement of its forms. At one time, Brunelleschi's style was attributed to the study of classical models, but in recent years it is more frequently considered close to the Romanesque—for example, to the Baptistery of Florence and San Miniato—or to the Gothic architect Arnolfo di Cambio. Brunelleschi's chief works are the dome of Florence Cathedral; the Church of San Lorenzo with the old sacristy; the Pazzi Chapel, in the cloister of Santa Croce, an architectural jewel which is entirely his own; the Church of Santo Spirito; and the Pitti Palace, which underwent many changes in the 16th century.

Brunelleschi influenced all the other Florentine architects of his time. They include Michelozzo or Michelozzi di Bartolommeo (1396-1472), who designed the Careggi Villa and the Medici-Riccardi Palace in Florence; Giuliano da Maiano (1432-1490); Benedetto da Maiano (1442-1497), known for Santa Maria delle Grazie at Arezzo and the Strozzi Palace in Florence; Giuliano da Sangallo (1445-1516), builder of Santa Maria delle Carceri at Prato and the sacristy of Santo Spirito in Florence; Simone Pollaiuolo, known as il Cronaca (1454?-1508), author of the Church of the Saviour at San Miniato.

Architects who broke away from the Brunelleschi tradition were Leon Battista Alberti (1404-1472), who had a more classical and solemn style, which we see in the façade of Santa Maria Novella and the Rucellai Palace in Florence, the Church of San Francesco (Malatesta Temple), partly destroyed in World War II, at Rimini, and Sant' Andrea at Mantova. Alberti wrote three treatises: *De pictura* (1436), *Della statua*, and *De architettura*. One of his followers was Bernardo Rossellino or Rossellini (1409-1464), who designed the Palazzo Pubblico, Piccolomini Palace, and Cathedral of Pienza, and there are traces of Alberti's style in Luciano da Laurana (fl. 1468-1482), who reveals, however, a personality of his own in the purity of the Ducal Palace of Urbino.

Early Florentine Sculpture.—Donatello (real name Donato di Niccolò di Betto Bardi, 1386?-1466), the great innovator in the field of Florentine sculpture, was one of Brunelleschi's closest friends. His contemporary, Lorenzo Ghiberti (originally Lorenzo di Cione di Ser Buonaccorso, 1378-1455), continued with an older style, extremely delicate and sensitive to decorative, linear rhythms. Ghiberti's chief works are the two gold-covered bronze doors of the Baptistery of Florence, 1403-1424 and 1425-1452), executed with all the delicacy of a goldsmith, which was his real trade. The first door is close to the plans of Andrea Pisano, the second definitely more Renaissance in feeling.

Donatello emerged from the group of late Gothic sculptors working on the Florence cathe-

dral—Nanni d'Antonio di Banco (1374–?1420) among them—and based his sculpture on opposition to the refined elegance of the Gothic tradition. Donatello emphasized the plastic element in his art. He favored realistic forms and brusque motions. In a clear manner Donatello applied Brunelleschi's principles of perspective to the bas-relief, causing his forms to melt into space by telescoping one plane into another and modeling with a rapid, impressionistic, and lively touch. His main works are the *St. George* (1416) now in the Bargello; the statues on the campanile of the cathedral, the *Annunciation* in Santa Croce; the *cantoria*, or singers' gallery, of the cathedral; the ceiling medallions and bronze doors of the old sacristy of San Lorenzo, all in Florence; the statue of Erasmo da Narni, called Gattamelata, in Padova, where he worked from 1443 to 1453, exercising a notable influence on local art, especially that of Mantegna; and the late pulpits of San Lorenzo (in Florence again).

Donatello's influence was supreme among 15th century Florentine sculptors—such men as Michelozzo, who was one of his collaborators; Bernardo Rossellino (tomb of Leonardo Bruni in Santa Croce); Desiderio da Settignano (1428–1464), the most sensitive of the group, author of many *putti* and groups of the Virgin and Child; Mino da Fiesole (1431?–?1481); Antonio Rossellino (1427–?1479); and Benedetto da Maiano. A sculptor who remained aloof from the Donatello tradition was Luca della Robbia (1400?–1482); he discovered the possibilities of glazed terra cotta, which became a specialty of his family.

Another celebrated member of the generation of Ghiberti and Donatello was Jacopo della Quercia (1378?–1438), a Sienese, equally great in spite of the fact that he attracted a lesser following. He worked at first in the late Gothic style, but soon added to it a plastic strength that swelled his forms with power, while still preserving their flowing sinuosity. In Siena, della Quercia did the Fonte Gaia as well as a bas-relief on the baptismal font of the cathedral. He also did the tomb of Ilaria del Carretto in the Cathedral of Lucca (1406) and the famous portal of San Petronio in Bologna.

Early Florentine Painting.—Masaccio (real name Tommaso Guidi, 1401–1428), a contemporary of Brunelleschi and Donatello, achieved something profoundly new in the field of painting. He was a spiritual descendant of Giotto, favoring forms stripped to their essentials, strong chiaroscuro effects, and a muted intensity of gestures and motions. He took over Brunelleschi's discovery of perspective and laid out his spaces and the figures peopling them in such a way as to focus attention on the center of action. The frescoes of the Brancacci Chapel in Santa Maria del Carmine in Florence are his greatest achievement. Here he had Masolino da Panicale as a collaborator, but his own influence was far stronger than that of the older man. His scenes include the *Expulsion from the Garden*, the *Tribute Money*, *St. Peter Healing the Sick*, and *St. Peter Distributing Alms*. Other of Masaccio's works are the painting of *St. Anne* in the Uffizi Gallery; the altarpiece originally in the Carmine Church at Pisa, now scattered among galleries in Pisa, London, Naples, and other cities; the fresco of the *Trinity* in Santa Maria Novella; part of the Crucifixion in San Clemente in Rome; and a few others.

Up to the time of Michelangelo all the Florentine painters studied the Brancacci frescoes, among them Fra Giovanni da Fiesole, known as Fra Angelico (1387–1455), usually praised for his religious feeling but not sufficiently valued for his great artistic importance. He probably began as a miniaturist, in a manner akin to that of Lorenzo Monaco, but soon developed a radiant style of painting where enamel-like colors are combined with bright spaces, and planes are made to stand out by means of the light falling upon them, and delicately drawn figures are caught in postures of exceeding grace. Fra Angelico worked at Fiesole, Cortona, Florence (whose Convent of San Marco, where he left frescoes in every cell, has been turned into a personal museum), Orvieto, and Rome (frescoes of the Chapel of Nicholas V in the Vatican).

Fra Filippo (or Lippo) Lippi (1406?–1469) is generally associated with Fra Angelico, although he was equally subject to the influence of Masaccio (*Coronation of the Virgin* in the Uffizi Gallery and frescoes in the Cathedral of Prato). Other prominent 15th century Florentine painters were Paolo Uccello (real name Paolo di Dono, 1397–1475), a master of perspective and author of battle scenes in the Uffizi Gallery, Louvre, and the National Gallery of London, as well as the frescoes in the Green Cloister of Santa Maria Novella; Andrea del Castagno (1423–1457), who had a rough but clear-cut style and painted frescoes in Sant' Apollonia, the Villa Pandolfini (now at Sant' Apollonia), and in S. Annunziata; and Domenico Veneziano (c.1400–1461), noted for his powerful drawing and luminous colors (*Santa Lucia* altarpiece in the Uffizi Gallery).

Piero della Francesca (real name Piero dei Franceschi, 1420?–1492) became an apprentice of Domenico Veneziano and achieved a "synthesis of perspective, form, and color" to be seen in his frescoes of the *Story of the True Cross* in San Francesco, Arezzo; the *Baptism of Christ*, National Gallery, London; the altarpiece at his birthplace, Borgo San Sepolcro; the *Flagellation* in the Ducal Palace of Urbino; and the portraits of Federico da Montefeltro and Battista Sforza in the Uffizi Gallery. Piero, in his turn, influenced Alessio Baldovinetti of Florence (1425?–1499); Melozzo da Forlì (1438–?1495), who painted frescoes in Loreto and Rome; Il Perugino (real name Pietro Vannucci, also called Pier della Pieve, 1446–1523); and Luca d'Egidio di Ventura de' Signorelli (also called Luca da Cortona, 1441–1523), who owes some of his dynamic movement and anatomical knowledge to Antonio Pollaiuolo, and is known for his frescoes in the Cathedral of Orvieto.

Toward 1460 two Florentine masters stood out above the rest: Antonio Pollaiuolo (1429–1498) and Andrea del Verrocchio or Verocchio (real name Andrea di Michele Cione, 1435–1488), both of whom combined painting and sculpture. Pollaiuolo's preferred theme was the nude in motion, sketched in strong and incisive outlines. Among his paintings are the *Hercules and Antaeus* and *Hercules and the Hydra* in the Uffizi Gallery, the *Martyrdom of St. Sebastian* in the National Gallery, London, and *Tobias and the Archangel* in the Turin Gallery. His sculptures include the *Hercules and Antaeus* of the Bargello, Florence, and the tomb of Sixtus IV in the Vatican, Rome. Verrocchio, too, in contrast to the preceding generation, stressed an anatomical treatment of the body and dealt with it in hard outlines, but with

less tension than did Pollaiuolo. On the other hand, he lingered more over detail, displayed greater psychological insight and deeper study of chiaroscuro. Among his sculptured works are the sarcophagus of Giovanni and Piero de' Medici in San Lorenzo, the bronze *David* and marble *Bust of a Woman* in the Bargello, the Fountain of the Palazzo Vecchio, and *Christ* and *St. Thomas* on the outside of Or San Michele (all in Florence), and the monument to Bartolomeo Colleoni in Venice. Among his paintings are the *Baptism of Christ* (done with Leonardo) in the Uffizi Gallery, the *Madonna and Child* in the Museum of Berlin, and an altarpiece in the Cathedral of Pistoia.

Sandro Botticelli (originally Alessandro di Mariano dei Filipepi, 1444?-1510) came under the influence of Pollaiuolo and Verrocchio and was a pupil of Filippo Lippi. His lines are poetic and graceful with fine decorative rhythm and he conveys a feeling of melancholy and meditation: *Madonnas*, portraits, *La Primavera (Spring)*, and *Birth of Venus*, in the Uffizi Gallery. There was an almost endless number of painters in Florence in the 15th century; let us note further Domenico di Tommaso Bigordi, known as Ghirlandajo (1449-1498), who painted portraits and frescoes in Santa Maria Novella and Santa Trinità; Filippino Lippi (1457?-1504), who was the son of Filippo and a bizarre and unequal painter; and Piero di Cosimo, or di Lorenzo (1462-1521), who had an even more lively style, influenced by that of Leonardo.

Early Non-Florentine Art.—Away from Florence the arts also flourished, but not always in so continuous and coherent a fashion. The Sienese painters favored extremely delicate but more traditional forms, as in the work of Stefano di Giovanni, called Il Sassetta (1392-1450), Giovanni di Paolo (1403?-c.1482), and Neroccio di Bartolommeo di Benedetto de' Landi (1447-1500). Domenico di Bartolo (c.1400?-1447) and Matteo di Giovanni di Bartolo (1434-1495) came under the spell of the Florentine school, and in sculpture Lorenzo di Pietro, known as Vecchietta (c.1412-1480), and Francesco di Giorgio (in full Francesco Maurizio di Giorgio Martini, or di Martino, Pollaiuolo 1439-1502), who in addition did architectural work at the court of Urbino, were influenced by Donatello.

In northern Italy, Gothic forms continued side by side with Renaissance encroachments. In Venice, for instance, at the beginning of the 15th century architecture still had a completely Gothic character, as in the Cà d'Oro and the Cà Foscari. It was considerably later in the century that Antonio Rizzo (or Rizzi or Rizo, 1430?-1498) and Pietro Lombardo or Lombardi (real name Solaro, c.1435-1515), aided by his sons Antonio (c.1458?-1516) and Tullio (c.1455-1532), introduced the Renaissance style, which we see in the Foscari Arch and the Giants' Staircase in the Ducal Palace (Rizzo) and Santa Maria dei Miracoli (Lombardi). These men were also responsible for a new trend in Venetian sculpture. This had hitherto been dominated by the elaborate late Gothic style, as represented by the sculptors from other regions who worked on St. Mark's and the Ducal Palace, and also by a native Venetian Bartolomeo Buon or Buono (also Bon or Bono, d. 1464), who carved the *Four Virtues* of the Porta della Carta. Pietro Lombardi is chiefly remembered for the tomb of Pietro Mocenigo (1476) in Santi Giovanni e Paolo, and Rizzo for the monument to the doge Niccolò Tron in

Santa Maria dei Frari (1473), completed by others, and the splendid *Adam and Eve* of the Foscari Arch of the Ducal Palace.

In Lombardy, Tuscan architects undertook much work in the 15th century: Ospedale Maggiore of Milan (seriously damaged in World War II) by Filarete (real name Antonio di Pietro Averlino or Averulino, 1400?-1470), and the Portinari Chapel in Sant' Eustorgio, also in Milan, by Michelozzo. Giovanni Antonio Amadeo or Omodeo (1447-1522), architect and sculptor, was the chief Lombard artist, designer of the Colleoni Chapel at Bergamo and the façade of the Certosa (Carthusian Monastery) of Pavia, both extremely ornate. In the latter half of the century, the chief influence on Lombard architecture was that of Bramante.

As the Renaissance slowly made itself felt in Lombard painting, this took on an empirical naturalism and love of detail, together with a strong leaning for effects obtained from outlines of light. Vincenzo Foppa (c.1427-1515) was the leader of the Lombard school. Other painters were Bernardino Zenale (1436-1526) and Bernardino Butinone (1436-1507), authors of the altarpiece in San Martino, Treviglio; Ambrogio da Fossano, known as Bergognone or Borgognone (c.1450-1523), who was very active at the Certosa of Pavia; Gian Martino Spanzotti (mentioned 1480-1524), founder of the school of Vercelli; and Gaudenzio Ferrari (1484?-1546), who painted the frescoes of the Sacro Monte of Varallo and worked at San Cristoforo, Vercelli, and the Sanctuary of the Beata Vergine at Saronno, in addition to executing several altarpieces in churches and galleries of Lombardy and Piedmont.

In Padova, the school that came into being after the sojourn of Donatello was dominated by Andrea Mantegna (1431-1506), who had a conscious enthusiasm for classical antiquity and interpreted it in a style still marked by a certain Gothic crudity, with clear-cut, writhing, and violently foreshortened figures, monumental antique backgrounds, and architectural frameworks. Mantegna is known for the frescoes of the Eremitani of Padova, destroyed during World War II, and the bridal chamber of the Ducal Palace of Mantova. There are links with the school of Padova in the style of the Venetian painter Carlo Crivelli (1430?-1494), long active in Marche and author of many valuable *Madonnas*, and in Cosmè Tura (1430?-1495), the earliest of the masters of Ferrara, who was followed by Francesco del Cossa (1438?-1480) and Ercole de' Roberti (c.1456-1496). In Venice, Mantegna had a deep influence on Bartolommeo Vivarini, originally da Murano (1432?-1491), brother of Antonio (1415?-1470) and uncle of Alvise Vivarini (1446?-1503), and on the two sons of Jacopo Bellini. Gentile Bellini (1429?-1507) retained in his style an archaic element of distant Byzantine origin (organ doors in the Opera di San Marco), and later revealed a narrative vein akin to that of his pupil, Carpaccio, painting cycles of holidays, miracles, and processions: canvases formerly in the Scuola di San Giovanni Evangelista and now in the Venice Academy. His brother, the great Giovanni Bellini (c.1431-1516), in the course of his long career, moved away from the influence of Mantegna.

Leonardo, Michelangelo, and Raphael.—Toward the end of the 15th century the marked

differences among the local schools began to diminish. Increasing exchanges between northern and central Italy, the prevalence of the same artistic problems among all artists, and, above all, the dominance of several outstanding personalities made for greater unity and easier communication among the various regions. In this way Italian art acquired a national character and served as a guide and model to the rest of Europe.

This second stage of the Renaissance was opened by Leonardo da Vinci (1452-1519), a pupil of Verrocchio, who displayed in his very first works a magical use of chiaroscuro, an originality, loftiness, and graceful expression of ideas that set him at once head and shoulders above his fellow pupils, chief among whom was Lorenzo di Credi (1459-1537): *Annunciation* and *Adoration of the Shepherds* (Uffizi Gallery), a *Madonna* (Leningrad), and a *Portrait of a Lady* (Liechtenstein Gallery of Vienna). Leonardo spent the years from 1482 to 1499 in Milan in the service of Lodovico Sforza. He was a painter (*Madonna of the Rocks*, now in the Louvre, with another version in the National Gallery of London; *Last Supper*, which has worn badly, in Santa Maria delle Grazie, in Milan); sculptor (monument to Francesco Sforza, of which he did only a clay horse, which was, unfortunately, shortly destroyed by the French invaders); musician; organizer of parties and masquerades; mathematician; and architect and engineer. In every field to which he turned his hand he had no rival. When Lodovico was driven out by the French, Leonardo returned via Mantova and Venice to Florence. Here, in 1503, he was asked by the Signoria to compete with Michelangelo for a painting in the Palazzo Vecchio: Battle of Anghiari. He made a sketch but never did the mural. From this same period date the *Cartoon of St. Anne*, now in the Royal Academy of London (the Louvre painting—*Madonna with Christ Child in the Lap of St. Anne*—came later), and the famous *La Gioconda*, or *Mona Lisa*, in the Louvre.

Leonardo went further and further into study and research, with the result that he has left us a number of wonderful drawings (Uffizi Gallery, Louvre, British Museum, Windsor Castle, and other museums) and manuscripts, rediscovered and published in the 20th century, which furnish a mine of ideas, experiments, inventions, and prophecies in every field of science: *Codice Atlantico* (*Codex Atlanticus*) in the Ambrosian Library of Milan, manuscripts at the Institut de France, *Codice del Volo degli Uccelli* (*Treatise on the Flight of Birds*) in Turin, notebooks on anatomy at the Royal Library of Windsor.

Leonardo returned to Milan in the service of King Louis XII of France and stayed there from 1506 to 1513, except for the year 1507-1508, which he spent in Florence. After this he went to Rome, and in 1516 to France, where he died. In his art Leonardo went beyond the carefully drawn and circumscribed forms of the Florentine tradition. His edges were less clearly defined, while his atmosphere was enveloping, and deep shadows made the figures emerge in a mysterious way and seem possessed of a new spiritual complexity. His interest extended not only to man but to the whole universe as well.

Michelangelo Buonarroti (1475-1564), on the other hand, raised man, particularly in the representation of the nude, to new heights. He, too,

was at once painter, sculptor, and architect. As a very young man he frequented the Medici Garden with its collection of antique sculpture, and his very first work, the *Battle of the Centaurs*, contained the essence of his whole vision: a group of nude figures in combat with taut muscles standing out in relief. There followed the *Madonna of the Steps* in the Casa Buonarroti in Florence, the *Kneeling Angel* and *St. Proculus* and *St. Petronius* for the tomb of St. Dominic in Bologna, the *Bacchus* (Bargello), the *Pietà* in St. Peter's, the *David* (Bargello), the round bas-reliefs of the Royal Academy of London and the Bargello and the round painting of the Uffizi Gallery of Florence, and the unfinished *St. Matthew* of the Florence Academy.

In 1505, Michelangelo was called to Rome to build the tomb of Pope Julius II. He drew up a grandiose plan for a miniature temple under the roof of St. Peter's but eventually had to reduce it to the architectural structure dominated by the figure of Moses which was placed in San Pietro in Vincoli in 1546. The two figures of slaves now in the Louvre were intended to go on this tomb, as were the four unfinished slaves of the Florence Academy. Julius II himself made it difficult for Michelangelo to complete this work by assigning him soon afterwards the decoration of the ceiling of the Sistine Chapel (1508-1512). This gigantic work tells the story of Genesis, framed by magnificent nude festoon bearers and great figures of sibyls and prophets, which had a revolutionary influence on painting. The unveiling of the ceiling was witnessed by everyone of importance in Rome and its influence spread at once all over Italy. Later Michelangelo painted the *Last Judgment* on the altar wall of the chapel and the *Martyrdom of Peter* and *Conversion of Paul* in the Pauline Chapel (1542-1550), but these did not add any new element to his fame or touch the heights that he had reached earlier. Michelangelo at this point went back to sculpture and architecture.

Raphael (Raffaello Santi or Sanzio, 1483-1520) came in between the two great figures of Leonardo and Michelangelo. He was born in Urbino, an important artistic center of the 15th century, known for the work of Piero della Francesca, Melozzo da Forlì, Luciano da Laurana, Francesco da Laurana (c. 1425-1502), Francesco di Giorgio Martini, and others. He was a pupil of Perugino, and between 1500 and 1504 he painted in a style very much like that of his master, but radiant with youthful freshness and incomparable virtuosity (*Marriage of the Virgin* in the Brera Gallery at Milan, *Coronation of the Virgin* in the Vatican Gallery).

In 1504, Raphael went to Florence, where both Leonardo and Michelangelo were then active. He was quick to appreciate the quality and newness of their styles and to modify his own, which he modeled upon that of Leonardo. During the next years he painted a series of Madonnas—the *Madonna del Granduca* (Pitti Palace), the *Madonna del Cardellino* (Uffizi Gallery), *Madonna of the Meadow* (Vienna), *Madonna and Child with the Little St. John* (Dahlem Museum, Berlin), and *La Belle Jardinière* (Louvre)—and the portraits of Angelo and Maddalena Doni (Pitti Palace) and of Tommaso Inghirami (Gardner Coll., Boston). In 1508, he was called to Rome by Pope Julius II to paint frescoes in the Vatican: Stanza della Segnatura (1509-1511), Stanza d'Eliodoro (1511-1514), Stanza

dell' Incendio di Borgo (1514-1517), Sala di Costantino (1517-1524, executed by his pupils). His style at this point attained the solemn proportions of the portrayals of the *School of Athens*, *Expulsion of Heliodorus from the Temple*, and the *Mass of Bolsena*. Here he seems to have drawn upon Venetian coloring, which he may have learned from Lorenzo Lotto (a collaborator in the Stanza della Segnatura) even before the arrival in Rome about 1509-1511 of Sebastiano del Piombo, a pupil of Giorgione. At a later period the attempt to imitate Michelangelo caused a certain strain to appear in Raphael's style (Stanza dell' Incendio del Borgo and the *Transfiguration* in the Vatican Gallery). As a whole, however, his work is a monument of harmony and balance, intellect and culture.

Raphael's portraits are also remarkable: *Cardinal* (Prado Museum, Madrid), *Baldassare Castiglione* (Louvre), *Donna Velata* and *Leo X* (Pitti Palace). Another excellent portraitist was Sebastiano del Piombo (real name Sebastiano Luciani, 1485?-1547), who worked at the Villa Farnesina in Rome in 1512-1514, at the same time as Raphael, but in style came closer to Michelangelo: *Flagellation* in San Pietro in Montorio, *Deposition* in the Viterbo Museum. Raphael had several direct pupils—Giulio Romano (real name Giulio Pippi de' Giannuzzi, 1499-1546), who went to Mantova in 1524 and was very active there as both architect and painter; Gianfrancesco Penni, known as Il Fattore (1488?-1528); and Perino del Vaga (real name Pietro Buonaccorsi, 1501-1547). Raphael's influence was felt all over Italy to an extent surpassed only by that of Michelangelo.

Later Florentine and Northern Italian Painting.—While the greatest artists were flocking to Rome, Florence was falling from the position of capital of Italian art which it had acquired in the 15th century. It could still boast such masters as Fra Bartolommeo della Porta (Bartolommeo di Pagolo de Fattorino, 1475-1517) and Andrea del Sarto (real name Andrea Domenico d'Angnolo di Francesca, 1486-1531), who tried each in his own way to blend Leonardo's chiaroscuro with the form of Michelangelo, but in general Florentine art had taken on a provincial tone.

After 1512 there came a sort of crisis, in the form of mannerism, which spread throughout Italy as more and more people came to know the ceiling of the Sistine Chapel. Jacopo da Pontormo (real name Jacopo Carrucci, 1494-1557), a pupil of Andrea del Sarto, was led by natural sensibility and dissatisfaction with the naturalistic and chiaroscuro effects of the traditional Florentine manner to adopt a certain stylistic exasperation, but at the same time he displayed a new and untrammelled imagination. Among his works are the *Deposition* in the Church of Santa Felicità in Florence, frescoes at Poggio a Caiano and the Certosa, and many portraits. Il Rosso or Il Rosso Fiorentino (real name Giovanni Battista de' Rossi, 1494-1540) had some points in common with Pontormo, but his chief successor in the field of portraiture was his pupil Il Bronzino (real name Agnolo or Angiolo di Cosimo, 1503-1572), who painted in a more formal vein. Other members of the mannerist school were Domenico Beccafumi (originally Domenico di Pace, 1486-1551) of Siena, called Il Meccherino, and Il Parmigianino or Parmigiano (real name Girolamo Francesco Maria Mazzuoli or Mazzola,

1503-1540), an extremely graceful artist who painted the frescoes in the Castle of Fontanellato and the Church of the Steccata in Parma, and various portraits.

Parmigianino was a pupil of Correggio and came from northern Italy, where, toward the end of the 15th century, artistic trends as important as those at Rome developed. Correggio (Antonio Allegri da Correggio, 1494-1534) was trained in the school of Ferrara but was largely influenced by Mantegna and the delicate chiaroscuro of Leonardo, as is seen in the *Campori Madonna* in the Modena Gallery, the *Zingarella* in the Naples Gallery, and *Madonna Blessing St. Francis* at Dresden. Later he felt the influence of Rome and his style developed with the frescoes on the ceiling of the Convent of San Paolo in Parma (1518), those of the cupola of San Giovanni, Parma (1520-1523), and of the Cathedral of Parma (1526-1530), where the vault gives the illusion of breaking through and opening on figures daringly projected into space and foreshortened in order to achieve perspective. This original concept had an enormous influence in the following years. Here we may see the beginning of the fluttering veils and draperies and the glimpses of sky with which the baroque painters decorated domes and ceilings.

In his later period, Correggio did a great many altar panels—*Madonna della Scodella* and *Madonna with St. Jerome* in the Parma Gallery, *Madonna and St. George* and the *Holy Night* or *Nativity* of Dresden—and a number of mythological compositions—*Ganymede* and *Io and Jupiter* (Vienna), and *Danaë* (Borghese Gallery in Rome), a gay and voluptuous vision, softened by the marvelous flexibility of the figures and the delicate use of chiaroscuro.

Venetian Painting.—In Venice during the last quarter of the 15th century there came into being a school which by its unity and originality was equal to the earlier school of Florence. This Venetian movement was still in full flower when the group in Rome had passed its prime. The Venetian painters of the Renaissance obtained effects of depth through the use of colors rather than line, blending them in aerial perspective and creating a new relationship between light and shadow. Their figures were wrapped in an enveloping atmosphere and stood out without rigid outlines. The effect was intimate and natural rather than abstract and rational as had been true of the Florentines. Landscape also assumed a new importance.

The painter who began this movement was Giovanni Bellini. Around 1475, after the altarpiece *Coronation of the Virgin* at Pesaro, he drew away from the influence of Mantegna and achieved more open spaces with softer and more sculptured forms. This change of style is generally attributed to the influence of Antonello da Messina (1430?-1479), who had become acquainted in Naples with Flemish painting and doubtless also knew the work of Piero della Francesca. After working for a time in the south (*Annunciation and Madonna with Saints Gregory and Benedict* in the Museum of Messina), Antonello came to Venice (1475-1476), where his lost altarpiece of San Cassiano served as a model for Venetian painters for the next 20 years. Antonello was also a first-rate portraitist, witness the examples in the Louvre, the Castle of Milan and the Civic Museum of Turin.

It is equally probable, however, that the modi-

fication of Bellini's style was coincidental rather than derived. This phase of Bellini inspired the rustic and serene Giovanni Battista Cima, called Cima da Conegliano (c.1459–1517 or 1518), and Bartolommeo Montagna of Vicenza (1450?–1523). During his next period (San Giobbe altarpiece, Santa Maria dei Frari triptych of 1488, the *Baptism* in Santa Corona at Vicenza of 1502, and the altarpiece of San Zaccaria of 1505), he influenced Giorgione and Titian and in his turn, was influenced by them (*Lady at Her Toilet* in Vienna and *Feast of the Gods* in the Widener Collection, Philadelphia). Bellini painted an enormous number of pictures, which are scattered in museums on both sides of the Atlantic. His contemporary, Vittore Carpaccio (b. before 1460–d. before 1526), painted in a vein of story and fable, immersing his narratives in an atmosphere of life and light (*History of St. Ursula* in Venice Academy, 1490–1500; scenes of St. George and St. Jerome, San Giorgio degli Schiavoni).

Il Giorgione or Giorgione da Castelfranco (originally Giorgio Barbarelli, c.1478–1510) is generally considered the creator of tonal painting, but this innovation was previously evident in the late Bellini and Carpaccio. Giorgione accentuated atmospheric effects and a blending of colors harmonized in one dominant tone in such a way as to express a dreamlike and poetic vision. He originated and developed a taste for nonreligious themes, rich in allusions and naturalistic touches, and for pictures of small size which were acquired by individual collectors. His larger paintings include the altarpiece *Enthroned Madonna* at Castelfranco, the *Judith* in Leningrad, *The Storm* in the Giovannelli Gallery, Venice, *The Three Philosophers* in Vienna, the *Portrait of a Young Man* in Berlin, the *Fête Champêtre* of the Louvre, and the *Venus* of Dresden. These last two works are often attributed to Tiziano Vecelli or Vecellio, known as Titian, who is the author of *The Concert* in the Pitti Palace, formerly credited to Giorgione.

In Titian's long career (he was born about 1480 and died in 1576), there was a period in which he painted somewhat like Giorgione (*The Concert*, Prado *Madonna*), which ended with the frescoes *Miracles of St. Anthony of Padua* in the Scuola del Santo of Padua (1511). After this his forms were enlarged, his luminous colors spread out over wide areas, and he created images of Olympian beauty: *Sacred and Profane Love* (Borghese Gallery), *Flora* (Uffizi Gallery), the series of pictures painted for Alfonso d'Este, the *Bacchanals* of the Prado, the portraits *Alfonso d'Este* and *Laura Dianti* (Louvre), and a series of sacred conversation groups. In the Frari *Assumption of the Virgin* (1518), there appeared a new rush of movement, which was characteristic of the next 20 years: *Bacchus and Ariadne* in the National Gallery of London, the altarpiece *Resurrection of Santi Nazzaro e Celso* at Brescia (dated 1522), the *Madonna Pesaro* altarpiece at the Frari, the *Deposition* now at the Louvre, and others.

Titian's fame was immense, and after the dukes of Ferrara his patrons included the dukes of Mantova; Emperor Charles V, of whom he did some famous portraits; the dukes of Urbino (the *Venus of Urbino*, the portrait of *Francesco Maria della Rovere*, duke of Urbino, now in the Uffizi Gallery, and *La Bella* in the Pitti Palace); Francis I; Pope Paul III (portraits in the Naples Gallery); and Philip II of Spain. His style

continued to develop, characterized by a remarkable quality of painting and a gift for psychological interpretation most evident in his portraits. In the years 1535–1550 his compositions revealed a plastic element undoubtedly inspired by Michelangelo. This phase was followed by an increasingly immaterial vision of life. His human figures were enveloped and almost absorbed by a dense atmosphere, and the play of light and shadow made for fantastic transmutations in which they seemed to be only concrete embodiments of the surrounding air. From this final period date the *Martyrdom of St. Lawrence*, the *Annunciation* in San Salvatore, Venice, and the unfinished *Pietà* of the Venice Academy.

All the Venetian painters of Titian's time were drawn into his orbit: Jacopo Palma, called Palma Vecchio, or Il Vecchio (1480?–1528), who did the *St. Barbara Between St. Anthony and St. Sebastian* in Santa Maria Formosa, (Venice); Giovanni Antonio da Pordenone (real name Giovanni Antonio de' Sacchi, 1483–1539); Bonifazio Veronese or Veneziano (properly Bonifazio dei Pitati, 1487–1553); Paris Bordone (1500–1571); and others.

Lorenzo Lotto (c.1480–c.1556) had a restless and imaginative spirit, and great originality, as well as a sense of form less regular and humanistic than that of Titian, and a more incisive use of light. He went from Venice to Marche and then to Rome (1509–1512); to Bergamo (1513–1527), where he influenced the local school of painting and that of Brescia, represented by Giovanni Girolamo Savoldo (c.1480–c.1548), Il Romanino (real name Girolamo Romani, 1485–1566), and Il Moretto (real name Alessandro Bonvicino or Buonvicino, 1498–1554); and to Loreto, where he died. He was receptive to every influence—Raphael, the German and Lombard schools—and although he sometimes appears rudderless, he maintains a uniformly high level. Among his works are the *St. Jerome* in the Louvre (1500); the altarpiece of Santa Cristina, Treviso, and those of Asolo (1506), Recanati (1508), and Bergamo—San Bartolommeo in 1516, and San Bernardino and Santo Spirito in 1521—the frescoes at Trescorre; the altarpieces of the Carmine (1529), and of Santi Giovanni e Paolo (1542) in Venice, and those at Jesi, Cingoli, and Macerata; many fine portraits and smaller pictures; and his last work at Loreto, which has the beauty of the older Titian with an added note of intimate trepidation.

Il Tintoretto (real name Jacopo Robusti, 1518–1594) marks the beginning of a more spectacular type of painting. He matured at the time when Titian was laboring under the spell of Michelangelo and adopted mannerist forms, which were transfigured by fantastic effects of light and shadow, which grew more and more accentuated. Tintoretto's compositions are full of motion and drama, painted with a rapid touch, with strong light effects standing out against shadow. His production was enormous. It consisted mostly of sets of large pictures such as those of the Scuola di San Marco, now divided between the Venice Academy and the Brera Gallery, including the *Miracle of St. Mark* (which first brought him fame in 1548), the *Transportation of the Body of St. Mark*, and *St. Mark Rescuing a Shipwrecked Saracen*; and the immense cycle of mural paintings of the Scuola di San Rocco, on which he worked at three different periods be-

tween 1560 and 1587. Other works are the canvases in Santa Maria dell' Orto (*Presentation of the Virgin in the Temple*), the Ducal Palace (*Marriage of Bacchus and Ariadne and Paradise*), and San Giorgio Maggiore (*Last Supper*).

Paolo Veronese (real name Paolo Cagliari or Calari, 1528–1588) painted in a very different style. After studying with Antonio Badile (1518–1560) in Verona, he was attracted to Michele Sanmicheli, who gave him a classical grandiosity, and came to Venice with a style all his own and a range of deep, bright colors set against the light and carried over into large and serene forms, together with a remarkable sense of intervals and harmony. The Venetian tendency was to melt colors into one another and make shadow predominant, whereas Veronese lightened the shadows, played on contrasting colors, and created a world more luminous than that of reality, suffused with an atmosphere of joy and festivity. He, too, painted large pictures and decorative cycles: ceilings of the council room and the college of the Ducal Palace (*Venice Enthroned*), from 1572 to 1575; the ceilings, altarpieces, and frescoes of San Sebastiano, Venice; the frescoes of the Villa Barbaro at Masèr; and a series of biblical banquets now in the Turin Gallery, the Louvre (*Christ at Emmaus*), and the Venice Academy, besides many other altarpieces, portraits, and mythological compositions.

Jacopo, or Giacomo, da Bassano (originally Ponte, 1510–1592) was closer to Tintoretto than to Veronese. Though living in the atmosphere of 16th century humanism, he preferred to depict peasants, animals, and market places, and is sometimes called the forerunner of genre painting.

16th Century Architecture.—*Rome.*—The transition from 15th to 16th century architecture is typified by Bramante (real name Donato d'Angnolo or d'Angelo, 1444–1514). About the years 1477–1479, at about the same time as Leonardo, Bramante was active in Lombardy: Santa Maria presso San Satiro and the apse and doorway of Santa Maria delle Grazie, both of which are in Milan. In 1499, he transferred his activities to Rome, where the circular temple (Il Tempietto) of San Pietro in Montorio and the cloisters of Santa Maria della Pace led up to his major works: the court of the Belvedere in the Vatican and the project for rebuilding St. Peter's with a central plan and a dome. A grandiose conception of space and a strengthening of the architectural masses in such a way as to intensify the effects of light and shadow and chiaroscuro are characteristics of his style, which inspired all those who followed him, including his successors at St. Peter's: Fra Giovanni Giocondo (1433–1515); Giuliano da Sangallo (originally Giuliano Giamberti, 1445–1516); Raphael, whose genius for painting has overshadowed his harmonious achievements in building; Baldassare Peruzzi of Siena (1481–1536), close to Raphael and designer of the Villa Farnesina; and, greatest of all, Antonio da Sangallo il Giovane (originally Antonio Cordiani, 1483?–1546), who during the pontificates of Leo X (r. 1513–1521), Adrian VI (r. 1522–1523), Clement VII (r. 1523–1534), and Paul III (r. 1534–1549) dominated the Roman scene, with his work at St. Peter's and the Farnese Palace in Rome, and military constructions at Orvieto, Civitavecchia, and Perugia (this last, a citadel demolished in 1860).

Antonio da Sangallo was for a long time a rival of Michelangelo, who was turning more and

more to architecture. The latter's first assignments were given to him by Leo X and Clement VII in Florence—the façade of San Lorenzo (which he never carried out), the Laurentian Library and the new sacristy (Medici Chapel) in San Lorenzo, with the tombs of Giuliano and Lorenzo de' Medici, ornamented with the famous statues, *Day* and *Night*, *Twilight* and *Dawn*. The model for the chapel was Brunelleschi, but we can see that a powerful breath of something new has blown through his designs: the space seems more grandiose, and the framework more robust, the pediments are broken, and niches are placed where Brunelleschi had planned flat surfaces.

Michelangelo continued to work after his return to Rome, with no less fire but with still more grandiose movement. He had more to do after the death of Antonio da Sangallo, whom he succeeded at the Farnese Palace (cornice and central window) and at the architectural workshop of St. Peter's, which he directed from 1547 until his death. He changed Sangallo's plan to one "of lesser size but greater majesty," and built both the apse and dome. In 1546 he began to draw up a project for the arrangement of the Piazza del Campidoglio (Capitoline Place); under Julius III (r. 1550–1555), he worked on San Pietro in Montorio and San Giovanni dei Fiorentini; while under Pius IV (r. 1559–1565), he supplied plans for the Porta Pia (1561) and transformed the Baths of Diocletian into the Church of Santa Maria degli Angeli (1561–1563). While most of his efforts were devoted to bringing about revolutionary changes in building methods, the old Michelangelo went off by himself to sculpture and because his thoughts turned continually to death he did three *Pietà*, one for his own tomb, which is in Florence Cathedral, the Palestrina *Pietà* now in the Strozzi Palace of Florence, and the *Pietà* now in the courtyard of the Rondanini Palace in Rome. Each has outlines more worn out than the last, and their unfinished quality is the most perfect expression of a vision more and more immaterial.

Architecture continued to develop vigorously in Rome after Michelangelo's death. Architects thronged to the city from all over, and particularly from northern Italy, bringing with them tastes and training alien to the Florentine tradition and, in general, a trend toward more irregular and ornate forms. Giacomo da Vignola (real name Giacomo or Barozzi, 1507–1573) stands out above the rest of these architects. He was Michelangelo's successor at St. Peter's, and with the Villa Farnese at Caprarola, and Il Gesù, or the Church of the Jesuits, in Rome, which he was commissioned to do in 1568, he created types which were to serve as models to all his successors. Vignola's most immediate follower was Giacomo della Porta (1541–1604), who did the façade of Il Gesù. Another important architect of late 16th century Rome, in the footsteps of Michelangelo and Vignola, was Domenico Fontana (1543–1607) who came from Lago di Como and worked on St. Peter's under Pope Sixtus V (r. 1585–1590).

Venice.—In architecture as in painting, the other pole of Italian art at this period was Venice and its vicinity. The chief architects were Jacopo Sansovino, Michele Sanmicheli, and Andrea Palladio.

Jacopo Sansovino (real name Jacopo Tatti, 1486–1570) was educated in Florence and Rome,

but only in Venice, where he settled after 1527, did he create a style of his own, in which he brilliantly combined the monumental grandeur of structure characteristic of central Italy with the animated and airy pictorial effects of the north. The arcades and large windows of his buildings provide a background of shadow against which the well-modeled framework is projected into the light. Among his works are the old library of St. Mark, the *Zecca* (mint), the Scuola della Misericordia, and the Cornaro Palace. Sansovino brought Tuscan Renaissance forms to Venice and fused them with the dominant features of local architecture.

Michele Sanmicheli (1484-1559) of Verona was trained at Rome in the Bramante tradition and served as an assistant to Antonio da Sangallo in the latter's military constructions. After the sack of Rome in 1527, Sanmicheli returned to the north and worked at Venice, Verona, and other inland cities. His style is more massive and robust than that of Sansovino, but also his constructions blend together monumental structure with intense effects of light and shadow, obtained by deep openings and the alternation of recesses and projections in the body of his buildings, among them the Malfatti and Bevilacqua palaces, the Porta Nuova, and Porta Pallio at Verona, and the Grimaldi Palace at Venice.

Andrea Palladio of Vicenza (1508-1580) has always been considered the most classical of 16th century Italian architects. Modern critics stress the fact that his feeling for wide space is allied to contrasts of shading, which are accentuated by the antithesis between stretches of solid wall and deep doorways, together with luminous colonnades standing out against an empty background. Palladio left a vast number of works behind him, reflective of a wealth of ideas and highly original architectural devices: the Basilica (damaged in World War II) and Loggia del Capitano, the Chiericati and Valmarana (partly destroyed) palaces, and the Teatro Olimpico at Vicenza; San Giorgio Maggiore and the Church of Il Redentore at Venice; and a series of wonderful country houses in the surrounding region—Villa Godi-Porto at Lonedo, Villa Barbaro at Masèr, Villa Foscari at Malcontenta, and Villa Rotonda or Capra near Vicenza. Palladio's followers—the closest among them was Vincenzo Scamozzi (1552-1616)—interpreted his style in a cold, academic, and colorless manner. This was even more true of the neoclassical architects who throughout Europe took him as a model.

Florence.—The monumental architecture of 16th century Florence took on a more severe character. Giorgio Vasari (1511-1574) of Arezzo, who shone as an architect rather than a painter, built the Uffizi Palace in Florence, the headquarters of the Order of St. Stephen at Pisa, and the Loggia at Arezzo. Bartolommeo Ammanati (1511-1592), who was also a sculptor, designed the handsome Santa Trinita Bridge in Florence, which was unfortunately destroyed during World War II, and Bernardo Buontalenti (1530-1608), the Casino Mediceo. In Milan and Genoa, Pellegrino Tibaldi (1527-1596) and Galeazzo Alessi (1512-1572), both very active, obtained pictorial effects in their styles.

16th Century Sculpture.—Some of the great architects whom we have mentioned above were, like Michelangelo, first-rate sculptors as well.

Jacopo Sansovino adapted the refined plastic forms of the prevailing Florentine style to softer and more pictorial effects in both fields. The *Bacchus* in the Bargello is one of his youthful accomplishments, but he is better represented by his Venetian works: the *Madonna dell' Arsenale*, the statues of the loggia of the Campanile, the bas-reliefs of the bronze door leading to the sacristy of St. Mark's. Under his influence, the Venetian sculptors used animated surface movements subject to the play of light and shadow. The greatest of them, Alessandro Vittoria (1524-1608), did remarkable portrait busts fashioned with a quick, easy touch.

In 16th century Florence all the sculptors imitated Michelangelo, but with varying shades of interpretation. Baccio or Bartolommeo Bandinelli (1493-1560), who did the monument to Giovanni de' Medici (Giovanni dalle Bande Nere), copied him in a smooth but coldly academic style, while Bartolommeo Ammanati and Benvenuto Cellini (1500-1571) adapted his mannerist side to decorative purposes and drew from it greater flexibility of form and elegance of rhythm. Ammanati's masterpiece is the Fountain of Neptune in the Piazza della Signoria, and Cellini's the *Perseus* in the Loggia dei Lanzi. Cellini was also famous as a goldsmith and worked for a long time in France. Il Tribolo (Niccolò di Raffaello de' Pericoli, 1500-1550) revealed a vein of fresh rustic poetry in the fountains of Petraia and Castello.

In Lombardy, Giovanni Antonio Amadeo was a leading sculptor as well as an architect. After the activity of Gian Cristoforo Romano (1470-1512), Cristoforo Solari or Solario, known as Il Gobbo (1450?-1527), Benedetto Briosco, Agostino Busti, known as Il Bambaja (1483-1548), and the many other comparatively little-known sculptors who did the mass of statues in the Cathedral of Milan, Leone Leoni, known as Il Cavaliere Areolino (1509-1590), suddenly introduced into Lombardy the mannerist style (tomb of the marquis of Marignano in the cathedral). In Rome, on the other hand, a Lombard, Fra Guglielmo della Porta (died in 1577), with his tomb of Pope Paul III in the choir of St. Peter's introduced into the mannerist Roman style an accent of greater truth and directness and a robust plasticity. This was one of the ways in which the 16th century moved toward the baroque. Another move in the same direction can be seen in the work of Jean Boulogne, who was known as Giambologna (1529?-1608), a sculptor from Douai who came to Italy around 1551 and settled first in Rome and then in Florence. After studying the work of Ammanati, Tribolo, and Cellini, he created an increasingly complex type of composition, where the figures are in elaborate counterposition, presenting their surfaces in the round and requiring the spectator to look at them not from one but from many points of view. This process was a development of the serpentine line enunciated by Giovanni Lomazzo. Giambologna's most famous works are the *Neptune* in the principal fountain of Bologna, the *Rape of the Sabines* in the Loggia dei Lanzi in Florence, the *Hope* of the University of Genoa, numerous small bronzes such as the *Apollo* in the small study of the Palazzo Vecchio, the *Mercury* and *Bathing Venus* of the Bargello, the *Apennine Fountain* at Pratolino, and the *Venus* in a grotto of the Boboli Gardens.

17TH AND 18TH CENTURY ART

The chief elements of the baroque period of Italian art (which characterized the 17th century, and a good part of the 18th century before being superseded by the rococo and the neo-classical styles) are the Accademia degli Incamminati of the Carracci family at Bologna; the architectonic creations of Giovanni Lorenzo Bernini and Francesco Borromini in Rome, along with the architectural works that accompanied them; Caravaggio; the development of the Roman style into Piedmontese baroque, which was really due to Guarino Guarini of Modena and the Sicilian Filippo Iuvara, both of whom were trained in Rome; Bernini's sculpture; and the formation of an international school of art in Rome, where artists came to study and work from all parts of Europe.

Painting.—The Carracci or Caracci—Lodovico (1555–1619), Agostino (1557–1602), and Annibale (1560–1609)—founded an academy for the purpose of combating the caprices and exaggerations of the mannerists. They preached the study of the 16th century masters and held that a combination of the best features of each one—the plastic quality of Michelangelo, the chiaroscuro of Leonardo and Correggio, and the color of Titian—would produce an ideal eclectic style. For this theoretical aberration modern critics have unmercifully condemned them. In reality, among a host of merely clever and calculated academic compositions, they succeeded in some of their best works, especially those of Lodovico and Annibale, in attaining a mixture of realism and allusive feeling that was a new contribution to the art of the time and brought them a following throughout the continent. Such works include the *Annunciation*, *Madonna and Saints*, *Madonna of the Rosary*, and *Madonna degli Scalzi*, all in the Bologna Gallery, by Lodovico; and the *Baptism of Christ* in San Gregorio, Bologna, landscapes in the Doria Gallery, and frescoes of the Farnese Palace, Rome, by Annibale.

A host of painters flourished in the wake of the Carracci at Bologna. Outstanding among them was Guido Reni (1575–1642), who like most members of the school worked chiefly in Rome, painting an enormous number of portraits, altarpieces, and mythological compositions: *Atalanta* (Naples Gallery); *Aurora or Triumph of Phoebus* (Casino Rospigliosi), *Concert of Angels* (San Gregorio Magno, Rome). Among other followers of the Carracci, we may mention Francesco Albani or Albano (1578–1660) and Il Domenichino (real name Domenico Zampieri, 1581–1641).

Michelangelo da Caravaggio (real name Michelangelo Merisi, or Merisio, 1577–1610) rebelled against this exceedingly cultured circle. Coming to Rome from his native Lombardy around 1585, he soon found himself in open personal and artistic conflict with the painters of the day: hence a series of quarrels, prison sentences, and escapes, and creation of a kind of painting directly opposed to both mannerism and the eclecticism of the Carracci school. Caravaggio turned his back on tradition and effected a great simplification. He treated sacred themes in a manner which his contemporaries branded as brutally realistic, stripping them of their conventional idealization and interpreting them as scenes of everyday life, peopled by figures drawn from the lower classes. People were shocked to see him portray St. Matthew as a rough fisher-

man, with bare feet and widespread legs, and to take as a model for the Madonna on her deathbed a poor girl who had drowned in the Tiber. What Caravaggio was really doing was to refresh his spirit with elemental truths, which he then presented in a powerful and compelling manner. He painted not only human figures but also objects (his *Fruit Basket* in the Ambrosian Library of Milan is the first Italian still life) emerging from a shadowy background, in all their bodily solidity, giving them the illusion of reality without excessive detail so that they stand out like glimpses of nature struck by a ray of light. His was a naturalism that was not rational, but he had a feeling for direct lighting which he drew from the tradition of Lombardy, where all the great masters from Foppa to the school of Brescia (Lorenzo Lotto and Giovanni Girolamo Savoldo) had worked along the same line.

After a series of half figures with still lifes, the *Magdalen* and *Flight into Egypt* of the Doria Gallery, Caravaggio's first monumental work was the St. Matthew cycle in San Luigi dei Francesi (French Church of St. Louis) in Rome. There followed the *Virgin and Pilgrims* in Sant' Agostino (1597), the *Fall of St. Paul* and *Crucifixion of St. Peter* in Santa Maria del Popolo (1600–1601), the *Entombment of Christ* in the Vatican Gallery (1602), the *Death of Mary* in the Louvre (1605–1606), and the *Madonna dei Palafrenieri* in the Borghese Gallery. In 1607, Caravaggio fled from Rome to Naples, where he executed the *Madonna of the Rosary*, now in Vienna, and the paintings in the Church of the Misericordia; thence to Malta (1608), where he did work for the church of La Valletta and the portrait of Alof di Vignacourt (*Grand Master of the Knights of Malta*) now in the Louvre; and finally to Sicily (*Burial of St. Lucy* at Siracusa and *Nativities* at Palermo and Messina). He died a fugitive on the beach of Porto Ercole.

Caravaggio's revolutionary, antiacademic, and luminous vision influenced all of European art from the Flemish school to Diego Velázquez. He had many followers in Rome, among them Orazio Gentileschi (1563–1647), a Tuscan who was greatly influenced by the style of the youthful work of Caravaggio, migrating from Rome to Marche, and then to Genoa, Turin, Paris, and London; Carlo Saraceni (1585–1625); Bartolomeo Manfredi (1572–1605); the Roman Orazio Borgianni (1578–1616); the French Jean de Boulogne, known as Le Valentin (1600–1634); and a group of Flemings that included Gerard van Honthorst. In Italy, he chiefly influenced the 17th century Neapolitan school: Battista Caracciolo, known as Battistello (c.1570–1637); José or Giuseppe Ribera, known as Lo Spagnoletto (1588–1652), Mattia Preti, known as Il Cavaliere Calabrese or Il Calabrese (1613–1699), and Bernardo Cavallino (1622–1654). But his influence extended also to Genoa, Lombardy (Antonio d'Enrico, known as Tanzio da Varallo, c.1574–1644), and even to Bologna, still the domain of the Carracci (Guido Reni, sporadically, and, more, Guercino, real name Giovanni Francesco Barbieri, 1591–1666).

The Carracci school inspired the lively group of baroque decorators who, as the 17th century progressed, complicated their compositions with more and more illusory and scenic effects and intensified the restlessness of their movement. Among them were Pietro da Cortona (originally Pietro Berrettini, 1596–1669); Il Baciccio (real

name Giovanni Battista Gaulli, 1639–1709) of Genoa (the frescoes in the church *Il Gesù*); and Andrea dal Pozzo (1642–1709) of Trento, who did the frescoes in Sant' Ignazio, Rome. In Naples the influence of both Carracci and Caravaggio was reflected in the numerous paintings of Luca Giordano (1632–1705), who worked all over Italy; Salvator Rosa, also called Salvatoriello (1615–1673); the still-life painters such as Giovanni Battista Ruoppolo (1620–1683); and, in the 18th century, in Francesco Solimena (1657–1743), Francesco de Mura (1696–1782), and Corrado Giaquinto (1699–1765). In Genoa the influence of Peter Paul Rubens and Sir Anthony Vandyke made itself felt alongside those of Caravaggio and the Roman baroque school, with the work of Orazio de' Ferrari (1605–1657) and his son Giovanni Andrea (d. 1657), Giocchino Assereto (1600–1649), Giovanni Andrea Ansaldi (1584–1638), Valerio Castello (1625–1659), Giovanni Benedetto Castiglione, called *Il Grechetto* (1616–1670), and Bernardo Strozzi, a Genoese (1581–1644). The 17th century Lombard school was close to that of Genoa, with an added vein of pathos and piety designed to appeal to the religious feelings of the beholder: Pier Francesco Mazzucchelli, known as *Il Morazzone* (1571–1626); Giovanni Battista Crespi, known as *Il Cerano* (1576–1633), and his nephew Daniele Crespi (c.1590–1630). In Venice, 17th century painting was dominated by outsiders: Domenico Fetti or *Feti* (1589–1624) from Rome, Giovanni Lys (c.1600–c.1630) from Oldenburg, and Bernardo Strozzi from Genoa. Francesco Maffei (c.1625–1660) of Vicenza was the only heir to the local 16th century tradition.

The line of 18th century baroque decorators culminated in Giovanni Battista Tiepolo (1696–1770). To find his origins we must go back to Sebastiano Ricci (1660–1734), who after the long period of stagnation that followed the death of the 16th century Venetian masters was the first to re-establish contact with the new movements in Italian art in which the Venetians had no part. He went to Bologna, Rome, Milan, and Florence and acquired a free, mobile style, with a facility for light and vivacious decoration. Another forerunner of Tiepolo was Giovanni Battista Piazzetta (1682–1754), who studied with Giuseppe Maria Crespi, known as *Lo Spagnuolo* (1665–1747), the most intelligent painter of his time at Bologna. Tiepolo also drew upon Paolo Veronese, whose range of colors was lighter and brighter than that of the baroque decorative school. He soon abandoned the theatrical elements of this school's ornamentation, reduced to a minimum the use of architectural framework, thinned out his masses, and launched his figures into luminous open skies. In his work the theatrical quality of the baroque is lighter and more imaginative, and its melodramatic accents give way to an airiness of tones that lends his composition genuine decorative value.

Tiepolo painted a number of altarpieces, but for the most part he decorated walls and ceilings—frescoes of the cathedral (1726) and bishop's palace at Udine; frescoes of the Colleoni Chapel at Bergamo and the Villa Valmarana near Vicenza (destroyed); Gesuati ceiling in Venice, Clerici (destroyed) and Dugnani palaces in Milan (all of these between 1730 and 1740); then the ceiling of the Scuola del Carmine (1740–1744) and the drawingroom of the Palazzo Labia in Venice (1757); the stairway of the partially

destroyed archbishop's palace of Würzburg (1751–1753); and the ceiling of the Scalzi at Venice (destroyed), until his late works in the royal palace of Madrid, where the artist went in 1763.

By this time there was a neoclassical reaction to the liberties and caprices of the 18th century. With Tiepolo we may say that the great Italian tradition came to a close. Eighteenth century Venice did, however, produce several landscape painters who were to attain fame abroad. Francesco Guardi (1712–1793) made fantastic transformations of landscape in a shifting atmosphere where architecture and figures alike lost all consistency. The two Canalettos—Antonio Canaletto (originally Canale or Canal, 1697–1768) and Bernardo Belotto or Bellotto (1720–1780), his nephew—painted their landscapes as views. Their conscientiously faithful interpretations are distinguished by a marvelous unity of tone and perspective. Antonio worked for some years in London, and Bernardo Canaletto at Dresden, Vienna, and Warsaw. Eighteenth century Venice dissolved in caprice and the melancholy of Francesco Guardi bore traces of the approach to landscape painting that marked the two Canalettos. So-called 18th century frivolity found a last interesting artistic expression in the pastel portraits of Rosalba Carriera (1675–1757), which were known over most of Europe, and the genre paintings of Pietro Longhi (originally Pietro Falca, 1702–1785).

Architecture and Sculpture.—Architecture and sculpture in the 17th and 18th centuries developed along the same lines as painting. Architecture began by breaking down the unified, enclosed spaces of the Renaissance, while keeping and indeed accentuating monumental mass effects and vigorous contrasts. Then gradually it grew lighter in weight and even in color, for with a decrease in the contrast between recesses and protuberances the shadows thrown on the body of the buildings were less deep and glided almost luminously over the vast extents of flat surface. The same thing was reflected in the delicate modeling of sculpture.

Giovanni Lorenzo Bernini (1598–1680) was the great artist who transformed the mannerist style into baroque. The multiple trends of 16th and 17th century Rome, all the attempts to achieve effects of motion and open, pictorial space, were blended by his genius into an integral new vision. Internally, the irregularity of his ground plans, the chapels and galleries which interrupt the peripheral walls, give an effect of illusory and indefinite space much greater than that of reality. And the outside of his buildings, too, broken by lively bas-reliefs, offers a new prospect with every change in the onlooker's point of view, drawing the surrounding space into the general artistic effect. Bernini's constructions cannot be detached from the places where they have been erected, for he designed them in such a way that they should be seen from a particular standpoint and among definite local atmospheric effects, including in the effect what already existed around the building. Typical is the grandiose colonnade of St. Peter's (1656–1663), which opens up like the two arms of an immense ellipse. The broad, low façade of the church, which was designed by Carlo Maderna or Maderno (1556–1629) and was bitterly criticized for destroying the effect of the dome, is cleverly incorporated into the colonnade, with its heavy

horizontal lines displayed to advantage above the pillars. Others architectural works of Bernini in Rome are the Barberini Palace, which he completed, and Sant' Andrea al Quirinale (1678).

Bernini worked with equal freedom in the field of sculpture. Here, too, we have no cohesion of plastic masses, but a central force that projects the shape of the figures into space, accompanied by a continuous vibration of light and shadow. As the surrounding space is drawn into the architectonic effect, so the figures direct their gestures and motions into the air around them and belong in a compellingly natural manner to the real world. The first work that bears witness to these qualities is the *David* (1619) of the Borghese Gallery; then come the *Apollo and Daphne* and the *Rape of Proserpine* in the same place, the *Santa Bibiana* in the church of the same name (1626), the *San Longino* in St. Peter's (1638), the famous *St. Teresa* in Santa Maria della Vittoria (1644), the *Beata Lonovica Albertoni* in the Church of San Francesco at Ripa, and the tombs of popes Urban VIII (1647) and Alexander VII in St. Peter's, not far from his bronze altar canopy and *cathedra Petri*, or throne of St. Peter. There are also a number of splendid portrait busts (*Cardinal Scipione Borghese*, *Francis I d'Este*, *Costanza Bonarelli*) and fountains (the Four Rivers in Piazza Navona and the Triton in Piazza Barberini).

Bernini's production was enormous. He held a position of supreme prominence in the papal court, and his fame spread throughout Europe. Only two of his Roman contemporaries can be mentioned in the same breath: the architect Francesco Borromini and the sculptor Alessandro Algardi. Borromini (1599-1667), born in Canton Ticino, then Italian, was a very great and original artist, worthy of comparison to Bernini, whose glory overshadowed his except for a brief period of fame under Pope Innocent X (r. 1644-1655). His imagination was more sinuous, lighter, and more bizarre, and he made daring architectonic solutions: elliptic ground plans, undulating walls, interrupted entablatures, and towers that narrow into spires and pinnacles. He was imitated more in the later rococo period than in his own. His chief works are the churches of San Carlo alle Quattro Fontane, Sant' Agnese in Piazza Navona, Sant' Ivo alla Sapienza, the Collegio di Propaganda Fide, and the Filippini Oratory. Other important Roman architects of the 17th century were Pietro da Cortona (more sober in architecture than in painting), Carlo Rainaldi (1611-1691) and Carlo Fontana (1634-1714).

Outside of Rome, in Florence, which was still closely bound to the Renaissance tradition, and in Venice, the baroque style never acquired deep roots. One talented piece of work in Venice dating from this period is the church of Santa Maria della Salute by Baldassare Longhena (1604-1682), who also built the Pesaro Palace, The city of Turin, which had no architecture worthy of mention during the Renaissance, acquired one of considerable importance in the 17th and 18th centuries through the work of Guarino Guarini and Filippo Juvara.

Guarino Guarini (1624-1683) brought to Turin a complex style formed by the influence of Borromini in Rome and travels in Emilia, Sicily, and France. He showed himself a daring builder in the high domes of Santissima Sindone and

San Lorenzo, where he topped the churches below with a system of ribs and slender intersecting arches, functionally essential but possessing at the same time a decorative value of lines and perforations. His chief other works are the church of La Beata Vergina della Consolata, and the Carignano Palace and the Academy of Sciences, with their handsome brick walls. Guarini gave new architectural ideas not only to Piedmont but to the rest of Italy as well, and his work marked the transition from baroque to rococo.

Guarini's work was continued on an even greater scale by Filippo Juvara or Juvara (1676?-1736), who had also studied in Rome. His style was more luminous, harmonious, and serene, and the buildings he left behind him are familiar landmarks in the modern city of Turin: the new façade and the double staircase of the Madama Palace, the splendid Basilica of Superga on top of the hill of that name, the church of the Castle of Venaria and the Church of the Carmine in the city (both of these last damaged during World War II), the façade of Santa Cristina, and the grandiose hunting lodge at Stupinigi, with wings radiating out of a central body. He also worked outside Italy, building the royal palace in Lisbon and drawing up plans for that in Madrid, which was actually constructed by Giovanni Battista Sacchetti, his pupil.

Luigi Vanvitelli (1700-1773) was connected in his beginnings with Juvara, and accomplished much work of similar style and equal importance at the court of the Neapolitan Bourbons. His greatest single building is the royal palace at Caserta, a sort of Italian Versailles, with wonderful perspectives of gardens and fountains. Notable 18th century architects in Rome included Alessandro Galilei (1691-1737) and Ferdinando Fuga (1699-1780). After this time the greatest Italian architects went to work abroad. Francesco (or Bartolomeo) Rastrelli (1700-1771) built the Winter Palace and the Peterhof in Leningrad, and the palace at Detskoe (Tsarskoe) Selo, preceding Jacomo Quarenghi (1744-1817), who worked for many years at the court of Catherine II and was followed in his turn by Carlo Rossi (1775-1849).

Although Bernini's sculpture exercised a wide influence in the 17th century, its essential values were not properly understood even by his collaborators. He had as a rival in papal favor the architect-sculptor, Alessandro Algardi (1602-1654) of Bologna, who was in favor during a brief eclipse suffered by Bernini under the pontificate of Innocent X. He opposed to Bernini's animated and pictorial style a sterner and more static concept, which is expressed not so much in an academic work such as the marble altarpiece depicting the *Retreat of Attila from Rome* in St. Peter's as in his smaller figures and portrait busts, where he made strong characterizations: statue of *Innocent X* on the Campidoglio, bust of *Donna Olimpia Pamphili* in the Doria Gallery.

Other notable 17th century sculptors in Rome were François Duquesnoy, known as François Flaman (1594-1643), and Francesco Mochi (1580-1654), a native of Montevarchi, who first studied in Florence and carved the fine equestrian statues of Alessandro and Ranuccio Farnese in Piacenza. At the turn of the century we find the Lombard Camillo Rusconi (1658-1728); the Italianized Frenchman

Pierre Legros (1666–1718); the Roman Pietro Bracci (1700–1773), perhaps the freest and most vivacious of all, who directed the decoration of the Trevi Fountain; and Filippo della Valle (1697–1768), a Florentine whose work had clear, almost academic outlines. After him art passed over into the neoclassical style. Outside Rome, we must recall Gian Maria Morlaiter (1699–1781) of Venice, who left roughed-out pieces in the Correr Museum and also worked in Saxony and Russia, and Giacomo Serpotta (1656–1732) of Palermo, an original worker in plaster, who produced partitions, garlands, draperies, feminine figures, and *Putti* applied to the decoration of the oratory of San Lorenzo and the churches of Santa Cita and the Rosario.

International Influences.—In the course of the 17th and 18th centuries, Rome became a center of attraction for all Europe. As early as the 16th century Italian artists had worked in other countries. Leonardo died in France. Andrea del Sarto went there in 1518, followed by Sebastiano Serlio (1475–1554), Francesco Primaticcio (Le Primatice, 1504–1570), Niccolò dell' Abbate (also Abate or Abati, 1512?–1571), Il Rosso, and Benvenuto Cellini. Such were, indeed, the origins of the school of Fontainebleau. Titian worked for Francis I, Charles V, and Philip II, and Leone Leoni and his son Pompeo (d. 1608) were active for a long time in Spain. In the 17th and 18th centuries, we recall that Tiepolo died in Spain, the Canalettos worked in England, Saxony and Poland, and various architects and portrait painters were scattered about the courts of Europe.

An opposite movement also developed in the 16th century and grew in the two centuries that followed—namely, the migration to Italy of foreign artists, attracted by the flowering of the Renaissance. First came the Flemings of Rome, then Rubens, Vandyke, the Dutch followers of Caravaggio, and finally the French: Le Valentin, Simon Vouet, Nicolas Poussin, Claude Lorrain, and the rest. It became the custom for artists of every country to make a trip to Italy, and more particularly to Rome, the seat of many academies and a truly international center. There came a time when the leading artists and critics of Rome were none of them Italian. This fact was most apparent during the neoclassical movement, which had scholarly and archaeological origins, contemporaneous with the excavations of Herculaneum, Pompeii, the Palatine Hill, and Hadrian's villa at Tivoli. Little by little, archaeological interest developed into an aesthetic theory, and the brilliant light touch of the 18th century was judged to be frivolous in comparison with a revived ideal of classical grandeur and severity. Two Germans living in Rome, Johann Joachim Winckelmann (1717–1768) and Anton Raphael Mengs (1728–1779), established the canons of the new theory.

Among the Italian neoclassical artists only one, Antonio Canova (1757–1822), won European fame. Canova was trained in Venice, and his early works reflected the grace of the 18th century (*Apollo* and *Daedalus* and *Icarus* in the Venice Academy). Coming in 1779 to Rome, he executed the monuments to Pope Clement XIII in St. Peter's and Clement XIV in the Santi Apostoli, in which his style was abstract and academic, displaying great virtuosity of detail. His fame grew, and his sculptures of members of the Bonaparte family—the famous *Pauline*

(*Venus Borghese*) in the Borghese Gallery, Napoleon's mother, and Napoleon himself—his *Venus* in the Pitti Palace, and his *Hebe Pouring Nectar* (Berlin), and *Cupid and Psyche* (Louvre), together with many highly stylized busts, were generally considered to be perfect expressions of the taste of the times.

An active neoclassic artistic center grew up in Milan. Here we find Andrea Appiani (1754–1817), inheritor of some 18th century qualities, more praiseworthy for his portraits than for his official panegyrics of Napoleon (frescoes of the Royal Palace of Milan, which were completely ruined in World War II); and the architects Giuseppe Piermarini (1734–1808), a well-balanced pupil of Vanvitelli, builder of the façade of the Belgioioso Palace and La Scala Theater; Leopoldo Pollack (1751–1806); Simone Cantoni (1736–1818), and Marchese Luigi Cagnola (1762–1833), all of whom endowed the city with a distinguished and coherent architectural style. In general, however, Italian art was becoming provincial—the real center was now elsewhere. This condition held true throughout the 19th century.

19TH AND 20TH CENTURIES

Art of the 19th Century.—Italy had its romantic trend, but it made very little impression upon the academic style. Francesco Hayez (1791–1882), who taught at the Brera Academy of Milan, substituted medieval themes for those of classical antiquity, while the so-called Nazarenes in Rome and the purist groups of Rome and Florence substituted religious themes and looked to painters before Raphael rather than to either classical or Renaissance art but remained essentially academic and did not create a new style.

After 1850 groups in several Italian cities tried to combat the prevailing academic trend. Domenico Morelli (1826–1901), Filippo Palizzi (1818–1899), and Gioacchino Toma (1836–1891) worked in this direction in Naples; Federico Faruffini (1831–1869) and the *scapigliati* (wild-haired ones), including Tranquillo Cremona (1837–1878) and Daniele Ranzoni (1843–1889), in Milan; and above all, the groups called the *macchiaioli*, in Florence: Giovanni Fattori (1825–1908), Silvestro Lega (1826–1895), Telemaco Signorini (1835–1901), Vito d'Ancona (1825–1884), Odoardo Borrani (1834–1905), and Adriano Cecioni (1836–1886), the sculptor. Giovanni Boldini (1845–1931) went to Paris and became a fashionable portrait painter. Giuseppe de Nittis (1846–1884) was another who won fame in Paris. Worthy of note were the Piedmontese artists Antonio Fontanesi (1818–1882), Enrico Reyceud (1855–1928), and Lorenzo Delleani (1840–1908).

For the most part 19th century sculpture was insignificant, but Medardo Rosso (1858–1927), originally one of the *scapigliati* of Milan, was a sensible artist. His heads of laughing women and sick children reach the extreme limit of plastic disintegration, and the extremely light touch of his modeling pulverizes the light over his sculptured surfaces.

If the activity in building was uncommonly great during all the 19th century, architecture, in the chaotic imitation of all manners of styles, never reached so low a level of incoherence as then.

20th Century Trends.—In the 20th century, a new culture gradually formed in art, based on greater consciousness of the real problems of

artistic form and vision. One painter, Amedeo Modigliani (1884–1920), who worked entirely in Paris, stands by himself. The futurist movement (1910–1914) was noisily pugnacious but exercised a rousing influence on Italian art. Many of the most intelligent artists were futurists, at least for a time: Umberto Boccioni, (1882–1916), the painter, and Antonio Sant'Elia (1888–1916), the architect, both of whom died in World War I, as well as Carlo Carrà (1881–), who did not remain long in the movement but was stimulated by it to define his style more rigorously. Carrà, along with Giorgio de Chirico (1888–), had a later surrealist period, in which he lost his dogmatism and became one of the leaders of 20th century Italian art. De Chirico went farther in the surrealist direction, and his evocative themes made him well known in Paris and other foreign cities.

Among other Italian painters, two are especially worthy of note—Giorgio Morandi (1890–1964), and Filippo de Pisis (1896–1956). Morandi is from Bologna, a painter of landscapes and still lifes with a thoroughly thought-out sobriety of style. De Pisis, who lived for many years in Paris, was involved in the last phase of impressionism, and showed some surrealist traces. A talented and productive painter, he calls up with a light touch and precision and beauty of tone the fleeting aspects of life around him. The best modern sculptors are the late Arturo Martini (1889–1947); Marino Marini (1901–), whose style is more stylized and archaic; and Giacomo Manzù (1908–), who expresses psychological values with greater emotion. There is general admiration among young artists for Pablo Picasso, and abstract art is the subject of furious debate.

ANNA MARIA BRIZIO,
Author of "La pittura in Piemonte"; "Ottocento e Novecento."

7. MUSIC. The genesis of Italian music is in the language of Italy itself. Before the middle of the 13th century, the founding of the Ital-

ian *dolce stil nuovo* (sweet new style), and, later, the work of Dante Alighieri (1265-1321), the language of the literature of Italy had been Latin, quasi-Provençal, and French. The Latin literature of the Middle Ages began about the 7th century. It contained chronicles and hymns, such as the *Dies Irae* (later incorporated in the service of the Roman Catholic Church) and the *Veni Sancte Spiritus*. It included poems, often satirical, and treatises on natural history and theology, together with religious and secular legends, both old and new. This Latin, however, was not the tongue of classical purity, for after the coming of the northern invaders in the 5th and 6th centuries, the language, even as used in writing, lost its ancient character, while in verbal use it altered constantly until it evolved into the various dialects of the land. These dialects possessed simple grammatical structure as a common characteristic, though in vocabulary some remained nearer to their source than others. (See also sections on *Language and Literature*.)

The oldest musical examples set to Italian texts are to be found in the *laudi spirituali*, or sacred songs, many of which are preserved in a manuscript in the Magliabechiana Library of Florence. The composers, known as *laudisti*, were found principally among Franciscan monks, the most famous of whom was Jacopone da Todi (c. 1230-1306). The *laudi* represent an extension of the ecclesiastical spirit into the vernacular.

Early *laudi spirituali* were monodic in character, and were sung by fraternities of penitents who practiced flagellation as a means of atonement. In traveling from place to place, they were met by local religious groups who joined in the singing of these sacred folk songs. The penitential practice spread into Germany, where the participants were known as *Geissler* (flagellants). The movement reached its height about 1348-1349, during the Black Death. The melodic schemata of the *Geisslerlied* anticipated the Lutheran chorale, which played such an important part in the work of Johann Sebastian Bach. Papal disapproval hastened the end of this movement, especially in Italy, although bands of *laudisti* remained until the 16th century and exerted an influence upon Palestrina and the oratorio form.

The *laudi* belong to the genre of folk creation closely allied to the *ballata*—the Italian equivalent of the French *virelai* (virelay), with its *ripresa* (refrain), stanza (a middle section), and a repetition of the *ripresa*. The *ballata*, of which the popular *Donna Lombarda* is a favorite of the Piedmontese, was originally a song sung while dancing, and is not unlike the English ballad. Other species of popular *canzoni* (songs) are the *zingaresca*, the *frottola*, the *stornello* and *rispetto* (both beloved of the Tuscans), the *mattinata*, sung at the break of day, and the *vicariola*, a type of song indigenous to Sicily and named after a prison in Palermo. The *stornello* is variously known as *ritondelle*, *ritornelle*, *ritornello*, *fiore*, or *fioretto*. Authorities differ as to its origin, but the accepted explanation is that it was derived from the practice of singing *storno*, that is, one singer singing against another antiphonally.

In examining the regional differences in folk song, we find that Sicily is considered to be the source and parent through which all poetry, both popular and cultivated, passed to the rest of

Italy. In the songs of the Piedmont, Liguria, Lombardy, and Venice, we find many legends, but none records such historical traditions as are to be found in those of Sicily. Tuscany, Umbria, Romagna, Marche, and even Calabria record little of the historical data found in the Sicilian ballads. The saga of that island is set forth in its lyrical folk literature. The Greek, Saracen, Norman, French, and Spanish occupations are all recorded in song. So, too, are the revolutions of 1820, 1848, and 1860, and the sanguinary revolt of 1866. Many of these songs have been transcribed for modern concert use by Geni Sadero (1891-).

In contrast to the Sicilian songs, the Tuscan folk airs are tempered by the kindness and gentleness of the northern disposition and invested with a quiet dignity and delicate charm. Some of these poetic fragments were translated by the German poet Paul Heyse, making them available for musical settings by Hugo Wolf. Central Italy focuses its attention on the Neapolitan *Piedigrotta*, a festival held yearly in honor of the Madonna in August and in which many songs receive their initial hearing. Such tunes as *Funiculi, funicula*, a modern song par excellence, written to celebrate the opening of the funicular railway up Mt. Vesuvius, *Torna a Sorrento*, *Addio a Napoli* (a favorite of Enrico Caruso, 1873-1921), and many others, find their way into the folk literature of the people, although strictly speaking they are not of the folk genre. It is interesting to note that the exceedingly popular tune *I zampognari* (*The Bagpipers*), a Christmas melody, was the source of George Frederick Handel's Pastoral Symphony and aria *He shall feed His flock* in *The Messiah*, while many a composer has delicately lifted other lyrical folk segments and incorporated them into his own larger musical forms.

The most important species of folk poetry is the madrigal. It is the only species that became the property of the cultivated poet, and it subsequently led to the formation and development of the great polyphonic school of writing. This form was enthusiastically adopted by the Flemish school of composers who found themselves in Italy as *maestri di cappella* (choirmasters). The word madrigal is derived from a song sung by shepherds (*mandriano*) while taking their flocks (*mandria*) to pasture. Some authorities trace the word to the Italian *madre* (mother), signifying a poem addressed to the Madonna, while others conceive it as a corruption of the Spanish *madrugada* (dawn), equivalent to the Italian *mattinata*.

Rome and Venice cultivated the madrigal with great success. In Florence it attained tremendous popularity, appearing initially in the form of the *frottola*. In Naples it took firm root and flourished as the villanella. Transplanted to England, the madrigal found a freedom of harmonic treatment which it did not possess under the quasi-ecclesiastical guidance of the Roman and Venetian schools. The Italian text was soon supplanted by the English. Although this deprived the madrigal of its original flavor, the lack was compensated by the enthusiasm the new form found in its adopted country. Subsequently, it was neglected by both the Flemings and the Italians, and it gradually evolved into a species of chamber music with instrumental accompaniment. In England, it merged into the glee, a form of composition cultivated in no other

country. Some English authorities regard the glee as aesthetically superior to its German complement, the part song. By achieving a harmonic elasticity and substituting the modern tonalities for the ecclesiastical modes, the madrigal form opened an avenue for further progress in part writing, directly influencing the great Germanic school, which was to bloom and flower with the chorale. Thus, the madrigal, a product of Italian poetic thought, profoundly influenced the whole course of music composition of its day.

The golden period of the Italian madrigal reached its apex in the works of Giovanni Giacomo Gastoldi (c. 1556–1619), Baldassare Donato or Donati (c. 1530–1603), and Luca Marenzio (c. 1553–1599), who was called *il più dolce cigno* (the sweetest swan) and was doubtless the leading madrigalist of his time. At the beginning of the 17th century, the madrigal was invested with a new dramatic element. We see it influence the chromaticism of the coming opera and oratorio, and a new lyrical trinity is found in the brilliant works of Carlo Gesualdo, prince of Venosa (c. 1560–c. 1614), Orazio Vecchi (1550?–1605), and the great Claudio Monteverdi (1567–1643). In his *L'amfiparnasso*, Vecchi touches upon the novel idea of madrigal-comedy and choral forms for the stage, intermediaries between the madrigalian formalism and the coming experimentalism of the Florentine Camerata. Gesualdo and his bold chromatic progressions were strangely prophetic of the Wagnerianism to come almost 300 years later. The introduction of the unique tremolo effects in the violin, first found in his *Il combattimento di Tancredi e Clorinda*, together with the use of massive harmonies and expert treatment of dissonances, stamps Monteverdi as one of the bold geniuses of musical history.

It is in the transitional decades linking the 16th and 17th centuries that we find the development of new forms on which modern music relies: opera, oratorio, and accompanied solo song. Imbued with a desire to revive the Greek classical ideals, a group of Florentine nobles, poets, and musicians banded together. Known as the Camerata (sometimes as Bardists), they met at the palace of Giovanni Bardi, conte del Vernio (1534?–1612) and at the home of Jacopo Corsi (1560–1604) to discuss plans for the revival of the tonal art of classical antiquity. The first practical experiment of this group, undertaken by Vincenzo Galilei (c. 1533–1591), father of the famous astronomer, was a musical setting of Count Ugolino's lament from Dante's *Divina Commedia*. Galilei was the most prominent figure in the work of the Camerata, and his interest in art prompted him to write *Il Fronimo*, a literary dialogue in which he explained the method of tuning, then in vogue by Italian lutanists. His theoretical studies in tuning were in juxtaposition to those of his teacher, Gioseffo Zarlino (1517–1590), who believed that the octave should be divided into 12 equal semitones, whereas Galilei, in his blind adherence to Greek ideals, insisted upon the Pythagorean immutable system.

Zarlino and his contemporary, Lodovico Zacconi (born Giulio Cesare Zacconi, 1555–1627), constituted a formidable brace of theorists of the late 16th century. Zacconi's fame rests on his valuable *Prattica di musica*, a series of four books published in Venice between 1592 and 1622, which, in conjunction with the *Dodecachordon* of the Swiss Henricus Glareanus (real name

Heinrich Loris), and the *Musicae activae micrologus* of the German Andreas Ornithoparcus (real name Vogelsang or Vogelgesang), comprise the only clear works explaining the musical practices of the day. An earlier and more celebrated treatise similarly entitled *Micrologus*, now in the library of the Vatican, was compiled by Guido d'Arezzo (995?–1050) about 1025, and printed in 1784 by Martin Gerbert von Hornau in his *Scriptores ecclesiastici de musica*.

In addition to his advocacy of equal temperament for keyed instruments, a practice which was adopted by Bach 100 years later and completely realized only in comparatively recent years, Zarlino assured his place in music history by his three tracts entitled: *Istitutioni armoniche* (1558), *Dimostrazioni armoniche* (1571), and *Sopplimenti musicali* (1588). His triple literary effort clearly paved the way for the major and descending minor scales of modern music. One of Zarlino's considerations takes us to the human pulse as a unit of music measurement. This same human measuring device was used by Galileo Galilei (1564–1642) in determining the theory of isochronous vibration, when he timed the oscillations of a swinging lamp in the Cathedral of Pisa by means of pulse beats and found that amplitude of oscillation did not affect the isochronism of a swinging pendulum. This proved conclusively that frequency, not amplitude, of oscillation affects the pitch of a vibrating body.

The work of the Camerata gained impetus with *Dafne* (*Daphne*), a dramatic poem (1594) of Ottavio Rinuccini (1562–1621), set to music by Jacopo Peri (1561–1633). This early effort was received with such acclaim that for three years it was repeatedly performed during the carnival season. The actual history of opera, however, may be said to commence with *Euridice* (*Eurydice*), a *dramma per musica* written by Rinuccini at the behest of Grand Duke Ferdinand I, with musical settings by both Peri and Giulio Caccini (c. 1550–1618). This opera was performed as part of the festivities in honor of the wedding of Henry IV of France and Marie de Médicis in the Pitti Palace on Oct. 6, 1600. At this performance part of Peri's and part of Caccini's music was performed. It included a few choruses in madrigal style with dialogue carried on in the *stile rappresentativo*. This *stile rappresentativo* was nothing more than the subjugation of melody to fit the natural emotional surge of the text. It later gave rise to the recitative and the aria as we know them today. The music contained many vocal flourishes. This was especially true of Caccini's work. These flourishes proved to be the contributing factors to the decline of opera before the advent of Verdi, Puccini, and the moderns of the operatic school in Italy.

It was left to the genius of Monteverdi to reveal the possibilities of this new form. In his *Orfeo*, we find a tremendous advance over the simple music dramas of the Florentines, and in his pupil Francesco Cavalli (originally Pietro Francesco Cavalli-Bruni, 1602?–1676), we discern an improvement in the recitative and discover the use of male sopranos (castrati) for the first time. Cavalli foreshadowed the *aria da capo*, which was to become so prominent a feature of opera for the Italians.

At the beginning of the 17th century some comedy was being injected into an otherwise

classic and formal music drama. It was, at first, considered out of place and relegated to the entr'acte. These comedies were called *intermezzi* or *opera buffa* and formed a distinct part of *opera seria*. Fittingly enough, they were developed in Naples, which wrested the operatic leadership from Florence and Venice. The Neapolitan pre-eminence is due principally to Alessandro Scarlatti (1659-1725), a musician of natural gifts and one of the most indefatigable workers of his time—his operas alone numbered over 108. Under his guidance, the recitative took three distinct forms—the *recitativo secco* (unaccompanied), the *recitativo strumentato* (used in moments of intensity with orchestral accompaniment), and the aria (for impassioned vocal soliloquy).

By this time the opera had become more and more a vehicle for vocal display. The chorus faded in importance, and the librettos gradually assumed the melodramatic form of love intrigue, leaving the classic Greek drama behind. By 1725, the singing virtuosos had attained such influence over the operatic composers that they actually dictated their demands. Their insistence on vocal display rapidly led composers to a kind of formality that contained the seeds of decadence and artistic sterility. The golden age of *bel canto* had descended upon Italy, but, blinded by sheer virtuosity and vocal beauty, together with a degeneration of literary taste, opera was brought to a temporary decline.

In Domenico Cimarosa (1749-1801) we have a culminating point of both *opera buffa* and *opera seria*. A contemporary of Wolfgang Amadeus Mozart, Cimarosa had a much simpler and less varied style than his younger rival of Salzburg. His great success was achieved with *Il matrimonio segreto* (first produced in 1792), a work heard to this day. In *opera seria* he contributed *Gli Orazii e i Curiazii* (1794), one of the strongest heroic pieces of its time. Cimarosa is important chiefly as a type of his era; he bridges the gap between the early classical opera and the period of romanticism.

If the Italian composers did not take kindly to the spirit of romanticism that spread throughout Europe, they could not evade it completely. Gioacchino Rossini (1792-1868) was among the first to revise his design and adjust his methods to fit the new lyrical attitudes. He headed a group of writers who assumed the responsibility of salvaging the opera from an ever-widening pit of decadence. A thorough technical mastery in treating the human voice, however, was the only compensation for the general musical impoverishment that prevailed. But Italy's operatic conquest of the world was by this time complete.

It is in this generation that we glimpse an incipient schism between the Italian and German styles. One path led to mythological figuration and metaphysical speculation, while the other clung desperately to living human characterization that mirrored the soul of the auditor himself. The northern temperament plunged into a sea of ponderous musical dialectics, while the southerner cast deep beams of illumination on the operatic horizon, returning with characteristic Latin candor and simplicity to limn human emotion on a stage peopled with human beings.

Rossini, Gaetano Donizetti (1797-1848), and the Sicilian Vincenzo Bellini (1801-1835)—the three giants of the period—while retaining the Italian love for lyricism, at the same time ef-

fected certain reforms and brought about many improvements upon which the moderns were destined to build. That the works of these men are heard today is eloquent proof of their excellence and intrinsic worth. Despite the sparkle and musical wit of his *Il Barbiere di Siviglia* (*The Barber of Seville*), Rossini's sincerest work was *Guillaume Tell* (*William Tell*). Here he shows a strength of orchestral technique which greatly influenced the French operatic writers of his time. The simplicity and dignity vested in the work prove that he could set aside the flimsy and conventional and attack the subject of Tell with seriousness and reserve.

Although Donizetti and Rossini worked equally well in *opera seria* and *opera buffa*, the young Bellini was successful only in the serious vein. Both his *Norma* and *La Sonnambula* (*The Sleepwalker*) show a delicacy and sensitivity that surpassed even the great Rossini himself. For mastery of melodic power, Bellini has no peer. Despite a certain naive quality and a strain of effeminate sentiment, he rises at times to a grandeur which is not often found in Donizetti. Although the latter did not possess the melodic gift of Bellini, yet there is ample compensation for it in his characterizations, such as that of Naffeo Orsini in *Lucrezia Borgia*, which, for brilliancy and fierce dramatic power, were not equaled during his period. Both composers sustained the Italian love for lyricism so well that Wagner, years later, fairly shouted his praise of them. Both were alive to the necessity for reforms in their day. Neither could stem the Rossinian popularity, nor could they cope with the popularity of the *floriture* (vocal flourish) and flowing cadences so dear to the heart of the singer. On the whole, opera at this period was a sickeningly sweet (although beautifully melodious), ear-tickling, sensuous form which lacked virility. Opera awaited the coming of Giuseppe Verdi for definitive reforms.

When the most delicate taste had tired of the Donizetti-Bellini *dolcezza*, Giuseppe Verdi (1813-1901) breathed new life and hope into this moribund institution of the Camerata. He brought to bear the earthiness, the refreshing virility, and the savage strength it needed. His genius ran the gamut from vulgar depths to soaring heights. A fearless, sincere, and genuine artist, he had as his most noteworthy trait the ability to grow artistically to the very end of his life. In his early operas—*Oberto*, *Nabucco* (*Nabucodonosor*), *I Lombardi*, *Ernani*—he showed stiffness and a groping for freedom. It is in his *Rigoletto* (1851), that he first revealed a freer and more original style. His development through *Il Trovatore*, *La Forza del Destino*, *Aida*, *Otello*, and *Falstaff* shows a steady, methodical, and inexorable climb to the pinnacle of operatic fame. Mention must be made of his contemporary, Arrigo Boito (1842-1918), librettist and composer in his own right, without whose encouragement the world would probably never have heard *Otello* or *Falstaff*.

With the close of the 19th century, Italy saw a movement by her younger composers toward operatic story dealing with folklore and the everyday, prosaic existence in the provinces. In this group were Pietro Mascagni (1863-1945) and Ruggiero Leoncavallo (1858-1919), whose programmatic use of thematic material gave rise to the school of *verismo* (verism or realism). Both *I Pagliacci* of Leoncavallo and *Cavalleria*

Rusticana of Mascagni were products of this period. Both operas were built on popular folk legends; both were brilliantly orchestrated and achieved great popularity.

Out of the school of *verismo* came Giacomo Puccini (1858–1924), whose works have attained a great vogue. He was a sensitive artist with an active imagination, but his predilection for an expansive melodic phrase, extending even to those textual passages not warranting such treatment, has been criticized. Subsequent operatic successes were realized by a group of composers including Alfredo Catalani (1854–1893), Alberto Franchetti (1860–1942), Francesco Cilea (1866–1950), Riccardo Zandonai (1883–1944), Franco Alfano (1877–1954), the well-known Italo Montemezzi (1875–1952), who wrote *L'amore dei tre re* (*The Love of Three Kings*); Amilcare Ponchielli (1834–1886), author of *La Gioconda* and teacher of Mascagni; Umberto Giordano (1867–1948) with his *Andrea Chénier*; and Ermanno Wolf-Ferrari (1876–1948), whose *I gioielli della Madonna* (*The Jewels of the Madonna*) and *Il segreto di Susanna* (*The Secret of Susanne*) are very popular in the United States.

The popular view that Italian music concerns itself with problems of the theater only, has obscured the fact that Italy has given birth to many instrumental and dance forms. A cursory glance at the 16th and 17th century musical files reveals a wealth of material conclusively dispelling this misconception. No doubt, this mistaken belief was fortified by the fact that Italians have been purveyors of opera to the entire world. The overwhelming successes of the 18th and 19th century Italian theatrical enterprises, which influenced the entire Continent and had subsequent repercussions in England and the United States, contributed further to this warped viewpoint. The complete acceptance of operatic art by the musical world was inevitable, since it dealt with fundamental elements of human expression in its use of voice and gesture. Their coordinated use, joined with the power of sound, make for simple understanding as contrasted with symphonic complexities, which too often are poverty stricken in meaning. The psychology of sound is such that it comes closest to comprehension when it attains some kinship with the emotional tensions and releases of everyday experiences. It is precisely in this field that the Italian excels.

Italian melodic ingenuity gained impetus in the Middle Ages, when Gregorian art predominated. The subsequent unfolding of the Italian *Ars nova* (14th century music) reveals the acquisition of thirds and sixths as an advance over the simple organum of the Middle Ages. In Gioseffo Zarlino's *Istitutione armoniche*, we find mention of the untutored singers, who invariably sing the major third and sixth, at that time considered dissonant. Often the compositions of the *Ars nova* were aided by instruments reinforcing the voices which they accompanied.

While the Flemish group of composers in Italy relied heavily upon instruments, the Italians developed a purely vocal style that stands to this day as a supreme example of beautiful writing. This style was perfected by Giovanni Pierluigi (called da Palestrina, 1525?–1594), who stripped all artifice from his work to the end that exquisite melody and skillful use of declamation be happily united. In Palestrina we see the seed of a harmonic sense in the modern manner. The Roman Palestrinian orbit must include his pupil

Giovanni Maria Nanini or Nanino (1545?–1607), well known through his motet *Hodie Christus Natus Est*; Marco Antonio Ingegneri (1545?–1592), whose *Responsoria Hebdomadae Sanctae* (*Responses for Holy Week*) were at one time considered a work of Palestrina; Felice Anerio (1560?–1614), whose *Adoramus Te, Christe*, has erroneously been attributed also to Palestrina; and Gregorio Allegri (1582?–1652), known principally for his world-famous *Miserere*.

While the Roman school was occupied with compositions for church use, the northern school of the Venetians was founding an independent form of organ and orchestral composition. Andrea Gabrieli or Gabrieli (c. 1510–1586), through his *Agnus Dei* for five voices, was achieving antiphonal effects with double choirs at St. Mark's, while his nephew Giovanni Gabrieli (1557–1612), with his *Sonata Pian e Forte* and the instrumental *Canzone* for two violins, two cornets, and two trombones, was a pioneer in instrumental forms. Simultaneously these Venetians were perfecting the *ricercare*, precursor of the fugue; and Claudio Merulo (real surname Merlotti, 1533–1604), predecessor to Giovanni Gabrieli as first organist at St. Mark's, was developing an improvisational form in his toccatas. These *canzoni, ricercari*, and toccatas represent the transitional polyphonic forms linking the purely vocal art with early orchestral composition.

The first formal sonata imprint is to be found several generations later in Arcangelo Corelli (1653–1713), who established the four-part, slow-fast alternation that was to prevail up to the middle of the 18th century, when it evolved into the threefold fast-slow-fast conception. There were two types of sonatas in Corelli's day: the *sonata da camera* (chamber sonata) and the *sonata da chiesa* (church sonata). Continuing the work of the Venetians in establishing free forms in organ music, the Roman Girolamo Frescobaldi (1583–1643), sometimes known as the Italian Bach, extended, elaborated, and perfected all the accepted ideas which were to form the basis for the contrapuntal art of his northern musical brothers. A little later, we see a new type of instrumental music in the form of concerto where the solos and tutti were, at first, known as *concerto grosso*, and several soloists were employed in opposition to the *tutti* effects. The *sinfonia* (symphony) appears as a later development through the genius of Alessandro Scarlatti, in the form of an orchestral introduction to opera. Here is the birth of the overture consisting of three movements: an allegro, then an adagio or andante, followed by an allegro, usually in dance form. The sonata and concerto adopted this structure, while the symphony divorced itself from the opera and became the pedestal for all instrumental music to this day.

A prolific writer, Scarlatti penned over 108 operas, perhaps 200 masses (though only 10 are extant), and approximately 700 cantatas and oratorios. He stands at the head of the Neapolitan school. Another specialist in church music of this period was Francesco Durante (1684–1755), with his masses, psalms, motets, and hymns. Antonio Lotti (1667–1740) stands high in the esteem of the church for his *Crucifixus* for six voices, in addition to his numerous masses, while Benedetto Marcello (1686–1739) is remembered for his keenly biting work *Il teatro alla moda*, directed at operatic abuses then in vogue, together with his famous settings for the first 50 psalms.

Giovanni Battista Pergolesi or Pergolese (1710-1736) and his *Stabat Mater* are products of this period. Lesser representatives of church art include Giovanni Battista (known as Padre) Martini (1706-1784) of Bologna and Antonio Caldara (1670-1736). In recent times the great *Manzoni Requiem* of Verdi stands supreme, while the works of Lorenzo Perosi (1872-) attempt to recapture the ecclesiastical traditions of Palestrina.

The development of instrumental forms was matched by the instrumentalists and instrument makers, who were quick to seize upon new ideas and adapt them for their own use. In the field of violin makers were Andrea Amati (1530?-1611), Gasparo da Salò (real name Bertolotti, c. 1542-1609), and Antonio Stradivari (1644-1737), who improved the acoustical quality of the instrument. The Guarneri or Guarnerius family of Cremona (latter half of the 17th century) was interested mainly in strength of tone. In the field of the solo violin concerto, we find the names of Antonio Vivaldi (1678?-1741), Giuseppe Tartini (1692-1770), Gaetano Pugnani (1731-1798), and Pietro Antonio Locatelli (1693-1764), while the romantic figure of Nicolò Paganini (1782-1840) conjures up visions of demoniac techniques that have never been surpassed. The development of the piano by Bartolommeo Cristofori (1665-1731) to an instrument to be played *pian e forte* (soft and loud), whence it receives its name, opened vistas in composition for that instrument.

The heroic march of Italian music is one vast accumulation of tonal art through the centuries. Since the early 18th century, the Latin temperament has shown a marked preference for music of the theater, and the world has gratefully accepted the fruits of Italian lyrical genius. There is, however, another and very different Italy immeasurably removed from the spell of *verismo* and the lovelier terrain of Giovanni Sgambati (1841-1914), Giuseppe Martucci (1856-1909), Marco Enrico Bossi (1861-1925), and Leone Sinigaglia (1868-). The neoclassicism of the 20th century has its roots in Italy, and its initial efforts were given impetus by the gigantic musical intellect of Ferruccio Busoni (1866-1924). This movement marked the revolt against the romantic and postromantic subjectivism of the 19th century. The modern harmonic fabric enlists the creative power of Ildebrando Pizzetti (1880-), Riccardo Pick-Mangiagalli (1882-), and Francesco Malipiero (1882-). Mario Castelnuovo-Tedesco (1895-) and Vincenzo Tommasini (1880-) still cling to romantic remnants, although Tommasini's later works are neoclassic in style, while Ottorino Respighi (1879-1936) harks back to classical sources for his *Antiche danze e arie per liuto* (*Old Airs on Lutes*). A prolific composer in all forms, Respighi will be remembered chiefly for his handling of orchestral techniques, although his operas, *Maria Egiziaca* (*Mary of Egypt*), *Belfagor*, and *La Campana sommersa* (*The Sunken Bell*) have weathered the test of frequent performances. Vittorio Rieti (1898-) and Ruggero Vené (1898-) carry on their master's orchestral traditions. Rieti has achieved his greatest successes with the ballets *Noah's Ark* and *Barabau*, produced by Sergei Diaghilev. Lodovico Rocca (1895-) stands somewhat alone with his programmatic music, although one of his five operas, *Il dibuk* (*The Dybbuk*), based on a Hebrew legend, was produced at La Scala with great success in 1934.

Further revulsion against romantic sentimentalism and the pastel colorations of impressionism led to a mercifully short-lived movement representing extremely radical methods in all the arts in the cult of *futurismo* (futurism). Its musical tenets were, in part, outlined by Francesco Pratella (1880-) in his *Musica futurista* (1912). Futuristic music embodying new musical resources of nonperiodical vibrations was written by Luigi Russolo (1885-), who constructed noise instruments (*intonarumori*). Though unsuccessful, this movement spread to France, where *bruitisme*, as the French called it, may be tersely summarized by Jean Cocteau's observation on impressionism: "After the music of the silk brush, the music with the axe."

In the vanguard of young and extremely active composers delving into Arnold Schönberg's twelve-tone mechanisms is Luigi Dallapiccola (1904-), whose *Volo di notte* (*Night Flight*), based on an excerpt from a book by Antoine de Saint-Exupéry, uses a twelve-tone (called dodecachordal by Italians) melodic series. An integral application of the dodecachordal technique is found in his *Greek Lyrics*. Ennio Porrino (1910-), Antonio Veretti (1900-), Virgilio Mortari (1902-), Nino Rota (1911-), Riccardo Nielsen (1908-), and Giorgio Federico Ghedini (1892-) are members of this school. Luigi Cortese (1899-), a polytonalist, is known principally for his *Prometheus Bound*, while Adone Zecchi (1904-) applied his twelve-tone technique to his *Requiem for Men's Voices and Orchestra* (1943) and his *Invectives* for the same combination. Goffredo Petrassi (1904-), a neo-classicist who occasionally ventures into quartal harmony, achieved a degree of fame beyond Italian borders with his *Partita for Orchestra* (1933), while Renzo Rossellini (1908-), a neompressionist occupied principally with music for films, was introduced to New York audiences in 1946 through his *Canto de Palude* (1938).

At least three Italian Americans occupy a prominent place in the musical scene of the United States. Gian-Carlo Menotti (1911-) is justly famous for his operas *Amelia Goes to the Ball* (1937) and *The Island God* (Metropolitan Opera House, 1942); his charming radio opera *The Old Maid and the Thief* (1939); and his more recent works, *The Medium* (1946) and *The Telephone* (1947). Walter Piston, born in Maine in 1894, leaped to fame with his ballet *The Incredible Flutist* (1938), while Paul Creston, born in New York in 1906, is known principally for music in the symphonic medium.

The Italian directorial genius is a recognized commodity and precludes extended comment. Besides Arturo Toscanini (1867-), its stellar light, it includes Bernardino Molinari (1880-), Victor de Sabata (1892-), whose compositions have been heard in the United States, Gino Marinuzzi (1882-1945), Antonio Guarneri (1883-), Leopoldo Mugnone (1858-1940), Verdi's favorite conductor, and Sergio Failoni (1890-1947).

The tremendous national interest in music and its makers keeps over 30 publications busy chronicling the musical events in the peninsula. Among the leading contributors in the field of musicology are Guido M. Gatti (1892-), *La Rassegna musicale*, Fausto Acanfora di Torrefrancia (1883-), *Revista musicale italiana*, Fernando Liuzzi (1884-1940), Andrea della Corte (1883-), and Guido Pannain (1891-). Over 400 societies devote themselves exclusively to chamber music.

The Società del Quintetto has toured the Continent as well as Italy, while the Venetian Quartet and the Trio Italiano have toured as far afield as South America. The Gruppi Universitari Musicali—comprising students from 18 universities, with its Poltronieri Quartet—and the Corporazione delle Nuove Musiche concern themselves with ancient and new music in Rome, Milan, and Palermo. The ladies' lyceum clubs display a keen interest in new music.

Modern Italian music, endeavoring to revive symphonic forms of native caliber, spells grandeur, austerity, robustness, and conciseness—traits ordinarily associated with such old composers as Corelli, Monteverdi, and Scarlatti. Despite slight influences of French impressionism, Stravinskian primitivity, and Schönbergian complexities, its chief characteristic remains an Italianate lyricism. The postwar endeavors to settle regional differences should restore Italy to her historic position as chief purveyor of music to the world. See also separate biographies of the major composers.

Fellow, Trinity College, London.

8. SCIENCE. We cannot give an account of the progress of the experimental sciences in Italy from the beginning of the 17th century to the mid-20th century—from Galileo Galilei to Enrico Fermi—without reference to the political history of that period. There is a relationship of cause and effect between political and economic conditions and the material possibilities of carrying out research and experiment. The 17th century was a golden age for science in Italy and elsewhere. Probably even without Galileo, Sir Isaac Newton (1642–1727) would have made a contribution to physics as great as that of his Italian predecessor. But apart from the time lag between the two physicists, we must not overlook one striking and entirely original element in Galileo's work—namely, his break with Aristotelian tradition as revived by the Roman Catholic Church. It was this break that permitted not only the creation of a new science, but also the rise of a whole new spirit of inquiry, embodied in what we now call experimental research. Galileo lived at a particularly happy period for the

Italian universities, when both Padova and Pisa were in a position to subsidize scientific laboratories. Of course, any visitor to Pisa is impressed by the primitive equipment of the places where Galileo carried on his famous experiments with falling bodies, but they involved what were, for his times, considerable expenditures, certainly no less than those made for similar purposes by other European universities. This availability of funds accounts in part for the rapid growth of experimental science in the 17th century. Another factor of importance was the incipient conflict between the rising middle class and the old aristocracy.

The following period presents us with an entirely different set of conditions; indeed, in Italy the late 17th and the 18th centuries were times of political decadence. There was a shattering of the ideal of unity spread through the peninsula by the Renaissance and even a decay of the wealthy middle class. The discoveries of Marcello Malpighi (1628–1694), Luigi or Aloisio Galvani (1737–1798) and Alessandro Volta (1745–1827) would surely have led to further theoretical development and practical application within Italy had they found a more propitious political and economic environment. As it was, the voltaic pile attained recognition under the more favorable circumstances enjoyed by Sir Humphry Davy in England. It is no wonder, then, that experimental science declined in 18th century Italy, and that such first-rate talents as there were in this field did not assert themselves as they should, because a proper background was lacking.

The 19th century completes the picture we have sketched in above. Political and social conditions in Italy up to 1870 and unification did not favor the efficient organization of the universities or their laboratories. But with political unity and Italy's entrance into the ranks of industrial nations, there came a renewed impulse, made possible by grants of funds, toward activities in the field of science. From 1880 to 1914, Italy made scientific progress of a truly remarkable kind. Had it not been for the political degeneration of the Fascist period, this progress would have continued and been proportionate to the important role traditionally played by Italians among the civilized peoples of the world. In Fascist Italy a man like Fermi could not find scope for developing his creative genius, whereas under a democratic government he could have carried out his work in line with the great Italian contributions to progress and civilization.

The Age of Galileo.—We cannot understand the 19th century development of experimental science in the Galilean tradition unless we take into account the cultural and technical conditions prevailing in Italy since the Renaissance. "The appearance of a Leonardo or a Galileo is comprehensible only if we connect it with Italian industry," writes Harald Höffding in his *Den nyere Filosofis Historie (History of Modern Philosophy, 1894)*, and as Gabriel Séailles, the art historian, said in his *Léonard de Vinci: l'artiste et le savant* (1892): "A hundred years before Galilei there was in Italy a small group of free men whose minds were not cluttered up with excessive erudition. . . . They observed the sky and the earth, the life of plants and animals. . . . They made experiments, they went in for empirical and mathematical thinking, because they refused to accept anything as true that could not pass the test of demonstration and be proved by

the evidence of their own senses. They were aware that science represents a collective, social effort, that one man cannot build it up in a hurry, because it does not spring fully formed from his mind. For this reason, they met together, questioned one another, and exchanged news of their studies and discoveries. We may say that in the 15th century a group of artists, travelers, doctors, engineers, and gentlemen were the leaders of modern science."

Another valuable source of information about social and cultural conditions in Italy at this time is Jakob Burckhardt's classic work, *Die Kultur der Renaissance in Italien* (*The Civilization of the Renaissance in Italy*, 1860). Galileo Galilei (1564-1642) himself, at the beginning of his *Discorsi e dimostrazioni matematiche intorno a due nuove scienze* (*Dialogues Concerning Two New Sciences*, 1638) said: "The constant activity which you Venetians display in your arsenal suggests to the studious mind a large field for endeavor, especially that part of the work which involves mechanics." The rise of experimental science in 17th century Italy is an example of the interaction of technology and scientific development.

Although we are not chiefly concerned with Galileo's contributions to astronomy, we must note the influence of his *Sidereus nuncius* (1610) and *Istoria e dimostrazioni intorno alle macchie solari* (*Letters on the Solar Spots*, 1613), his development of the refracting telescope, and his discovery of the satellites of Jupiter, sunspots, the phases of Venus, the first traces of the ring around Saturn, and planetary orbits. His two principal scientific achievements, however, may be summarized as follows:

(1) *Experimental method*, of which he must be considered the founder, although nowhere in his writings has he given a detailed description of methodology or naturalistic logic. It would require considerable effort to coordinate the analyses of his sensations and experiments which we find scattered through *Il saggiaiore* (1623), the *Dialogo dei due massimi sistemi del mondo* (1632), and the *Discorsi e dimostrazioni matematiche intorno a due nuove scienze*. Connected with his use of the experimental method are his study of the resistance of various materials, particularly cylindrical and prismatic rods fixed at one or both ends; his calculations for the first rangefinding tables, based on his study of the motion of projectiles; and his study of the speed of light.

(2) *Foundation of dynamics and of experimental physics*. Galileo gives us in the *Discorsi* the theory of inertia and the laws that govern the motion of bodies falling through air or on an inclined plane, particularly the law that relates time and distance in uniformly accelerated motion, and the law governing the fall of bodies in a vacuum. (Although the laws of motion were conceived by Galileo, however, they were not definitely formulated until Newton.) Galileo did not use formulas in his work, but he did employ geometrical methods of demonstration. Closely allied to the foregoing is his discovery of the isochronism of the pendulum, found in the *Dialogo* along with the idea of the inertia frame of reference, a conception also called Galilean relativity. Besides demonstrating these laws and principles, Galileo based his work on axioms and postulates that were in direct contradiction to Aristotelian physics and have survived as classics

of mechanics. He also made various technical inventions of great importance to scientific progress, such as the development of the telescope, the pendulum equipped with a counter, which may be considered a predecessor of the pendulum clock made quite independently by the Dutch scientist, Christian Huygens or Huyghens, in 1656, and the geometric and military compass (1597).

Galileo created a school of scientists, some of whom left their mark in the history of science. The greatest of his pupils was Evangelista Torricelli (1608-1647). Out of Torricelli's experiments on the rise of water in pumps, which he attributed to external pressure, came the invention of the barometer (1643). He also made discoveries in the field of geometry (*Opera geometrica; De motu gravium*) which drew the attention of René Descartes and Huygens and paved the way for the later discoveries of Blaise Pascal and Newton.

Other scientists in the orbit of the school of Galileo were the mathematician Bonaventura Cavalieri (1598-1647), who created the method of indivisibles, and Giovanni Alfonso Borelli (1608-1679), one of the most renowned members of the Accademia del Cimento and founder of a school of iatromechanics. His most significant work is *De motu animalium* (1680-1681), in which he sought to apply mechanical principles to animal movements. It is within the tradition of Galileo that we must also mention Domenico Guglielmini (1655-1710), whose *Riflessioni filosofiche dedotte dalle figure dei sali* (*Philosophical Reflections Based on the Configurations of Salt*, 1705) was a fundamental step in the development of crystallography.

The conditions that favored the rapid development of experimental science as conducted by Galileo and his pupils were equally favorable to chemistry, as is shown by the publication of the treatises *De la pirotechnia* (1540), by Vannoccio Biringuccio (1480-1539); *I tre libri dell'arte del vasaio* (*Three Books on the Art of Pottery*, 1548), by Cipriano Piccolpasso (1524-1579); Rosetti's *Pictio de l'arte dei tentori* (*The Art of Dyers*, 1540); *Magia naturalis* (*Natural Magic*, 1558) by Giambattista della Porta (1538?-1615); and *De arte vitraria* (*The Art of Glassmaking*, 1612) by Antonio Neri (d. 1614). We must also call attention to the earlier physician and botanist, Andrea Cesalpino (1519-1603), who was influenced by the same environment that paved the way for Galileo and his school.

In the second half of the 17th century and during the greater part of the 18th century, Italy, unlike England and France, fell into a period of political and social decay. In order to find a real sequel to the Galilean tradition, we must pass on to the three great scientists of the end of the 18th century: Galvani, Volta, and Spallanzani.

Early Nineteenth Century.—Luigi or Aloisio Galvani, student of Jacopo Bartolomeo Beccari (1682-1766), with his *De viribus electricitatis in motu musculari commentarius* (1791), was a pioneer in the study of the physiological action of electricity. He observed that when the ends of a metal strip were placed against the lumbar nerves and muscles of a frog a spark was produced. This electricity he attributed to the frog, thus entering into controversy with Count Alessandro Volta, who, as a result, made a further study of the phenomena. This led in turn to the discovery of the voltaic pile (1800), a landmark in the de-

velopment of electricity and hence of modern civilization. Volta also studied the composition of marsh gas, perfected the udometer, and expounded the law governing the expansion of air at high temperatures. Lazzaro Spallanzani (1729-1799), who taught at the University of Pavia, made experiments in fertilization, disproving the theory of spontaneous generation, and wrote an account of his travels which was a considerable contribution to natural science.

During the first half of the 19th century, Italy's political condition, particularly the fact that the peninsula was split up into a number of small states, served to retard its technical progress in comparison with that of other European nations. It is not surprising, therefore, that scientific research should have fallen behind. Nevertheless some great things were accomplished, so that the Italian contribution to science continued to be of primary importance. The most distinguished Italian scientist of the period was Count Amedeo Avogadro (1776-1856), professor of physics at the University of Turin. His truly great scientific accomplishment was the formulation of the molecular theory, which developed the atomic discoveries previously made by John Dalton. Avogadro stated that there are particles known as molecules (compound molecules), which are made up of two or more atoms and may be broken down by a chemical reaction into their component atoms, or simple molecules. "On the basis of this hypothesis," Avogadro said, "we have a fairly easy means of determining the relative masses of molecules of bodies in a gaseous state and the relative number of these molecules in combinations, because the relations among the masses of molecules correspond to those of the densities of the various gases at the same pressure and temperature, and the relative number of molecules in any combination is obtained from the relationship among the volumes of gas of which it is made up." He is stating in this hypothesis, which is based on Joseph Louis Gay-Lussac's law of volumes, that there is no difference between volume and molecular mass—that the weight of the molecules is proportionate to their density, so that if we know the density then we know the molecular weight as well.

Avogadro elaborated his hypothesis in several fundamental studies, among them the *Trattato della costituzione generale dei corpi* (*Treatise on the General Constitution of Bodies*, 1837-1841), but his ideas failed at first to interest chemists, in part because he had not proved them experimentally. They found full acceptance only after his death, but his work became the basis of Cannizzaro's improvement upon Dalton's statement of the atomic theory.

Stanislao Cannizzaro (1826-1910), a student of Raffaele Piria, in his *Sunto di un corso di filosofia chimica* (*Short Course of Chemical Philosophy*, 1858), laid the experimental basis of modern atomic theory. Cannizzaro worked on already familiar ground to accomplish a necessary coordination of the theories of Avogadro with the results of another 50 years' experimentation. He gathered together the conclusions reached by Dalton, Avogadro, André Ampère, Marc Antoine Gaudin, and the later Jean Baptiste Dumas, Jöns Jakob Berzelius, Charles Frédéric Gerhardt, and Auguste Laurent, and established a clear distinction between molecular and atomic weights. He stated that the various quantities of the same element contained in different molecules are all

whole multiples of one quantity, which, because it always forms a single unit, properly deserves the name of atom. The value of this law transcends that of Avogadro's hypothesis because it gives a rigorous interpretation of the facts. Cannizzaro's clarification of the concept of atomic weight also went far toward the establishment of the theory of valence. Another of his contributions was the impulse he gave to scientific research by the setting up of well-equipped laboratories in both Palermo and Rome. Italian chemistry of the second half of the 19th century bears a strong imprint of the work of this great scientist, who also played an important role in the political life of his time.

Exchanges with other countries, particularly France and Germany, gave still more Italians a chance to make themselves known. Faustino Malaguti (1802-1878), a political exile who lived in France, was only one of the many notable chemists to emerge in the early part of the century. Ascanio Sobrero (1812-1888), a pupil of Théophile Pelouze and Justus von Liebig, discovered nitroglycerin. In 1852, Luigi Chiozza (1828-1889), a professor in Milan and a participant in Gerhardt's classic research in the field of the anhydrides of organic acids, discovered and made a synthesis of carbostyryl and studied the effects of alkalis on unsaturated acids. Raffaele Piria (1814-1865), who taught at Pisa and Turin, introduced new methods of synthesis, did fundamental research on salicin, populin, tyrosine, and aspartic acid and, in 1838, discovered salicylic acid. Cesare Bertagnini (1827-1857), a pupil of Piria and professor at Pisa, obtained a synthesis of cinnamic acid and did research on oxamide, phyllyrin, and the alterations undergone by certain organic acids in animal organisms.

Physics shared the position of chemistry in the mid-19th century, and had its share of distinguished practitioners. Ottorino Fabrizio Mossotti (1791-1863), whose reputation extended beyond the borders of Italy, did painstaking research in molecular physics and was a pioneer of mathematical physics in Italy. Macedonio Melloni (1798-1854), a Neapolitan liberal forced to leave his professorship in Parma after the insurrections of 1831, did much of his work in exile, in Geneva and Paris. Later, after he had returned to Naples, he founded Vesuvius Observatory (1847), did research in the fields of electricity and optics, with special attention to radiant energy, and established the identity of the energies of light and heat. He studied the thermal absorption of bodies, which he termed diathermancy, and discovered the spectrum of various kinds of heat emission. Carlo Matteucci (1811-1868), a friend of Piria who also took an interest in politics, investigated the physiological effects of electricity and worked to spread acceptance of atomic theory. He deserves further praise for having contributed, along with Piria, Pacinotti, and others, to the foundation in 1855, of the famous journal of physics, *Il Nuovo Cimento*.

Astronomy, geology, and mineralogy also produced scholars worthy of note in the first half of the 19th century. Father Pietro Angelo Secchi (1818-1878) directed the astronomical observatory of the Roman College and studied the spectrum of the fixed stars. Giovanni Virginio Schiaparelli (1835-1910), director of the Brera Observatory in Milan, is remembered for his important studies of the planet Mars and of comets. Annibale Riccò (1844-1919), geophysicist and as-

tronomer, studied Mount Etna, and also the relation between sunspots and protuberances. Among vulcanologists and seismologists the best known is Father Antonio Stoppani (1824-1891), who created a school of geology. Besides going in very actively for research, he wrote with great facility and his books spread the love of nature among the general public.

The Modern Period.—Italy's slow development of a national character, achieved only with the accomplishment of political unity, is reflected in the field of scientific research. Many scientists had only the scantiest means to enable them to pursue their studies, not a few of them took part in the political struggles of the time, and some were forced into exile. All this was tragic for science. After 1870, through the efforts of Quintino Sella (1827-1884), a man of modest scientific accomplishments, but a first-rate statesman, Italian universities were endowed with well-equipped laboratories, which soon stimulated scientific research. The period from 1870 to 1914, that is from the achievement of national unity to World War I, is of capital importance for scientific progress in Italy. This period deserves more detailed study, which should be linked with the history of Italian industry. Another very important factor in experimental science was the rapid development of mathematics.

Mathematics.—The mathematical tradition of the Italian Renaissance was revived in the late 19th century by a number of outstanding figures. They included Enrico Betti (1823-1892), who taught physics and mathematics at Pisa and was a pioneer topologist; Francesco Brioschi (1824-1897), a professor at Milan and a politician, who studied the theory of invariants, equations, and elliptic functions; Eugenio Beltrami (1835-1900), who took up non-Euclidean geometry and laid the foundation of mechanics in curved spaces; Luigi Cremona (1830-1903), who studied graphical statics and projective and algebraic geometry; Ulisse Dini (1845-1918), who taught at Pisa and made a profound study of the basis of the theory of the functions of real variables; and Luigi Bianchi (1856-1928), who left behind him important work in differential geometry. Giuseppe Peano (1858-1932), a professor at the University of Turin and a student of symbolic logic, indicated in his *Principi di geometria logicamente esposti* (*A Logical Exposition of the Principles of Geometry*, 1889), every logical proposition with symbols and developed the fundamentals of arithmetic and geometry in a rigidly rational but simple and intuitive manner.

Among other mathematicians were Giuseppe Veronese (1854-1917), who studied the geometry of hyperspaces; Corrado Segre (1863-1924), a professor at the University of Turin and a distinguished scholar in the field of algebraic and projective geometry; and Vito Volterra (1860-1940), of the University of Rome, who investigated analytic functions, hyperbolic and integral equations, and functional calculus. Tullio Levi-Civita (1873-1942), a professor at the universities of Padova and Rome, achieved far-reaching results in calculus, was a forerunner of the theory of relativity, and in 1918 introduced the notion of parallelism in curved spaces. Finally, Federico Enriques (1871-1946), a professor at the universities of Bologna and Rome and a positivist philosopher, is known for his book *Problemi della scienza* (*Problems of Science*, 1906), containing studies in arithmetic and analytic geometry.

Chemistry.—The mathematical discoveries formed the basis for chemical research in Italy. Its organization was due in large part to Cannizzaro, who, aside from his atomic studies, was a great organic chemist. The Cannizzaro reaction, which bears his name, led to the discovery of benzyl alcohol (1853), and to his research on santonin and its derivatives. He created a school of original research scientists whose leaders in turn enriched the various branches of chemistry. The most important of them were Emanuele Paternò, marchese di Sessa (1847-1935), Giacomo Luigi Ciamician (1857-1922), and Raffaello Nasini (1854-1931).

Paternò taught at the universities of Palermo and Rome and was also vice president of the Italian Senate. Soon after François Marie Raoult's work on cryoscopy, he investigated the molecular weight of dissolved substances (1886), and did research in the field of photochemistry, and on phosgene, polysulphides of hydrogen, and fluorides. Along with Cannizzaro, Ugo Schiff (1830-1915), and others, Paternò founded *La gazzetta chimica italiana* (1871), Italy's foremost chemical journal.

Ciamician was a professor at the universities of Padova and Bologna, chiefly known for his studies of the chemistry of pyrrole, the chemical action of light, and the behavior of alkaloids in plants. Nasini taught at the universities of Padova and Pisa. He popularized the electrolytic dissociation theory, worked on the refractivity of organic compounds in relation to their chemical composition, and studied the natural gases of Italy, the boracic exhalations of Tuscany, and the chemistry of many natural mineral waters.

Among Cannizzaro's students we must not forget Amerigo Andreocci (1863-1899), professor of pharmaceutical chemistry at the University of Catania, who is known for his studies of pyro-diazole, santonin, and triboluminescence. An illustrious contemporary of Cannizzaro was Francesco Selmi (1817-1881), professor of pharmaceutical chemistry at the University of Bologna, who distinguished the ptomaines and did research, which preceded that of Thomas Graham, on the colloids.

We find few great names at this time in the field of inorganic chemistry, if we except that of Augusto Piccini (1854-1905). But organic chemists in great numbers have left their names attached to some discovery or a new line of research in their field. Angelo Angeli (1864-1931), a student of Ciamician and professor at Florence and Palermo, discovered in 1896 nitro-hydroxylamine and made a noteworthy contribution to the knowledge of pyrrole derivatives and of nitrous compounds. Giorgio Errera (1860-1933), a professor at Palermo and Pavia who gave up his teaching rather than take the Fascist oath of allegiance, studied the chemistry of terpenes. Icilio Guareschi (1847-1928), of the University of Turin, worked chiefly in organic chemistry, toxicology, and chemical history, and conducted experiments with asparagine, urea, and naphthalene derivatives. He made a significant contribution to the chemistry of the ptomaines and the synthesis of hydropyridic compounds. Bernardo Oddo (1882-1941), a professor at the University of Pavia, was one of the most distinguished organic chemists of the early 20th century. Among his researches was a study of the reductive action of ethylaniline on Grignard's reagent. At the same time, he enriched the chem-

istry of the pyrrole and indole group with the preparation of derivatives of these two compounds.

Physical chemistry came to be the object of special study in Italy after the diffusion of Svante Arrhenius' theory of electrolytic dissociation. One of the pioneers in this field was Raffaello Nasini, at the end of the 19th century. The Gibbs-Roozeboom theory of phase rule opened wide possibilities of research in the field of metallography, in which we must count among the most important scholars Federico Giolitti (1880-1946), professor at the Polytechnic Institute of Turin and later an industrial consultant.

Industrial chemistry has a more modest history because up to the beginning of the 20th century there was no real chemical industry in Italy except in perphosphates and mineral acids. Luigi Gabba (1841-1916) of the Polytechnic Institute of Milan was a pioneer of teaching in this field, and his successor, Ettore Molinari (1867-1926), studied the action of ozone on unsaturated compounds, particularly oleic acid. Luigi Casale (1882-1927) introduced into Italy the process of synthesis of ammonia under high pressure, a method which has been applied in other countries, including the United States. In connection with the synthesis of ammonia we must mention Giacomo Fauser (1892-), engineer and director of the Montecatini Company, who obtained the synthesis under medium pressure. Fauser, the best trained technical chemist of modern Italy, brought about certain modifications of the technique of hydrogenation or cracking of the petroleum found in Albania. The economic self-sufficiency and isolation aimed at by the Fascist regime had very bad effects on the Italian chemical industry. Industrial chemistry depends on scientific research, which was retarded by World War II and by the deficiencies of many young teachers whose jobs had been secured by political influence rather than scholarly merit.

Biochemistry dates from Baron Justus von Liebig's *Die Chemie in ihre Anwendung auf Agrikultur und Physiologie* (1840), and Italy has had three great practitioners in this field. Gino Galeotti (1867-1921) was one of the first in Italy to apply the methods of physical chemistry to the study of physiological processes. Filippo Bottazzi (1867-1941) created a school for the study of biochemistry at the University of Naples, where he taught for a long time, and his *Trattato di chimica fisiologica* (*Treatise of Physiological Chemistry*, 1898-1899) had for 30 years a great influence in this field. Luigi Sabbatani (1863-1928) is responsible for the physico-chemical interpretation of many toxic processes.

Other chemists and physiologists contributed to biochemical studies. Among the glucosides we have Piria's studies of salicin (1838), and Bertagnini's of phillyrin (1854). When Piria submitted salicin to the action of warm, dilute acids and to that of emulsin, he discovered its glucosidic character and cleared up the nature of saligenin. In 1855, he proved that populin, discovered by Henri Braconnot in 1830, was a derivative of benzoysalicin. Bertagnini observed that phillyrin is a glucoside, and when heated with dilute acids it breaks up into glucose and phillygenin. The group of proteides has not received much study, but we must mention Malaguti's observation of the presence of sulphur in cystine (1837), and Piria's observation of the deamination of amino acids under the action of nitrous acid (1846).

Also worthy of note is the research on the ptomaines, which are produced by the putrefaction of proteid substances. Selmi, in 1872, was the first to enter this field, which received further study from the physiologist Angelo Mosso (1846-1910). Nor must we forget the work done by various scientists on hormones and melanin.

Biology and Zoology.—There are both importance and originality in the work of Giuseppe Levi (1872-), a teacher of anatomy at the University of Turin who has done research in cytology and histology. In 1933, Levi observed that, in cultures of the rhombencephalon of advanced embryos, after a few passages of a certain regularity in the wide space between the smear and the edge of the retracted coagulum, there appears a membrane made up of flattened epithelial cells and nerve cells, some of which maintain their atypical character and put forth multiple anastomosed feelers among themselves. This research on the part of Levi and his students was made possible by the Rockefeller Institute.

In the field of zoology, one of the pioneers of transformist theories was Filippo de Filippi (1814-1867), a professor at the University of Turin. During the first half of the 19th century systematic zoology flourished in Naples through the work of Gabriele Costa (1787-1867), who left behind him various works on the fauna of the region. His successor, Michele Lessona (1823-1894), a strong supporter of Charles Darwin, worked on the fauna of the Piedmont region. In 1874, Anton Dohrn (1840-1909) set up the Zoological Station of Naples, which was frequented by many scientists from abroad. Enrico Giglioli (1845-1909), a professor at the University of Florence, also contributed greatly to zoology with his monumental work, *Avifauna italica*.

Later came Carlo Emery (1848-1925) and Giovanni Battista Grassi (1854-1925). Emery was a student of Paolo Panceri (1833-1877), and was among the first Italians to base zoological research on new histological and anatomical techniques. He made a fundamental morphological chart of tetrapod mammals and accomplished a very interesting study of ants. Grassi, a professor at the University of Rome, took up Nematoda, leptocephalous Cestoda, and Phylloxera. He came to the conclusion that malaria is spread among human beings solely by the Anopheles mosquito, in which a life cycle of the malaria parasite takes place. In his work entitled *Studi di uno zoologo sulla malaria* (*A Zoologist Looks at Malaria*), he gave a biological description of the various forms of Plasmodia. This work and the method prescribed therein powerfully influenced all research on malaria for almost a half century afterwards. Among students of parasitology, we must mention Edoardo Perroncito (1847-1922), a professor at the University of Turin, known for his work on intestinal worms, and Corrado Parona (1848-1922), author of an important volume, *Elmintologia italiana* (*Italian Helminthology*).

Anatomy.—Several anatomists are worthy of note. Bartolomeo Panizza (1785-1867), a professor at the University of Pavia, is celebrated for his doctrines of cerebral localization and radicular ataxia. Filippo Pacini (1812-1883) was a pioneer in biological and histological research. Giulio Bizzozzero (1846-1907), a professor at the University of Turin, did inspiring work in histology and general pathology; he dis-

covered plastins and demonstrated the hematopoietic function of bone marrow. Camillo Golgi (1844–1926), a professor at the University of Pavia, was one of the most eminent scientists of the second half of the 19th century. His name is linked to the study of the structure of the nervous system and the Golgi reaction. Giuseppe Levi is the author of *Trattato di istologia* (*Treatise of Histology*, 1928), which has been translated into various languages. Besides making the cultures of tissues on slides described above, he discovered new details in the nuclei of nerve cells.

Botany.—Botany has been practiced as an experimental science in Italy since 1860, when the first institutes of research along this line were set up in the universities. Two schools of botany held sway during the following years, one Italian and the other German. The outstanding figure in the Italian school was Federico Delpino (1833–1905), who did fundamental work in plant biology. Meanwhile, the German school influenced the work of another Italian, Giuseppe Gibelli (1831–1898), and he had two able followers, Pietro Pirotta (1853–1936) and Oreste Mattioli (1856–1947), who taught in the universities of Rome and Turin, respectively. Pier Andrea Saccardo (1845–1920), noted for his fungological research, left a monumental work entitled *Sylloge fungorum omnium*, while his pupil, Giovanni Battista de Toni (1864–1924), worked on the algae. Among the cytologists we must recall Luigi Buscaglioni (1863–), who worked on histological technique for plants, and Sergio Tonzig (1905–), who did interesting work on the structure of protoplasm. Gabriele Luigi Montemartini (1869–) studied the fixation of atmospheric nitrogen on the part of certain saprophyte fungi with fallen leaves, while Gino Luigi Pollacci (1872–) covered the same process on the part of higher plants.

Physics.—Physics has always been brilliantly represented in Italy, even if an Alessandro Volta is not born every day. In the second half of the 19th century both teaching and laboratory research were on a high level. One of the most renowned physicists of the century was Augusto Righi (1850–1920), who made memorable experiments on electromagnetism, Hertzian waves, X-rays, and optics. His work on Hertzian waves was an incentive to Marchese Guglielmo Marconi (1874–1937) in his discovery of wireless telegraphy, one of the leading technical conquests of modern times.

The universities of Rome, Pisa, Bologna, and Florence, all of them endowed with up-to-date institutes of physics, furnished large numbers of teachers and research scientists to other universities and technical schools. Two names stand out in the second half of the 19th century: Antonio Pacinotti (1841–1912) and Galileo Ferraris (1847–1897). The former—son of Luigi Pacinotti (1810–1881), who taught experimental physics at the University of Pisa—was director of a modest laboratory of technical physics at the Normal School of Pisa. In 1858, he invented the Pacinotti ring, and in 1860, the “little machine,” or forerunner of the dynamo, which was imitated by Zénobe Théophile Gramme in 1872. Galileo Ferraris, a professor at the Museum of Industry and the Polytechnic Institute of Turin, was an eminent physicist and electrical engineer who discovered the rotary magnetic field. In his electrical studies, Ferraris upheld the impor-

tance of vectorial methods and demonstrated their usefulness in the exploration and representation of physical phenomena.

After the beginning of World War I, experimental physics entered a period of decay, due in part to the lack of adequate laboratories, and also to the small interest shown by students in the traditional subjects of research, most of which had already been undertaken in wealthier countries. The main fields seemed to have been thoroughly explored and all that was left to do, on condition of finding financial support, was to carry systematic research in them a little further. A new and fruitful period was opened, however, by a talented young scholar, Enrico Fermi (1901–), who developed a flourishing school in atomic physics. This school was broken up by the racial laws of 1938, which drove Fermi and some of his most gifted students into exile.

Fermi is internationally famous for his studies of the quantum theory and his pioneer research in molecular physics. In 1926, Fermi founded the statistical tables that bear his name, based on the study of the behavior of gases at a low temperature. He found a solution to his problem by applying to gases Pauli's exclusion principle, originally applied to internal quantum conditions.

After the discovery by Walther Bothe and H. Becker (1930) and Irène and Frédéric Joliot-Curie (1932) of artificial radioactivity, Fermi began research in Rome aimed at ascertaining whether a bombardment of neutrons would produce the same phenomena of radioactivity as those discovered by Joliot-Curie. Experiments carried out in collaboration with Franco Rasetti (1901–), Edoardo Amaldi (1908–), Oscar D'Agostino, Emilio Segrè (1905–), and B. Pontecorvo led in 1934 to the activation of some 40 heavy elements out of the more than 60 which were tested. Fermi and his collaborators discovered the slowing up of neutrons by means of paraffin, a phenomenon which is due to the presence of hydrogen. After the neutrons have for some time bombarded the nuclei of hydrogen, they give up their own vital force and move at a velocity the same as that of thermal agitation. By bombarding uranium with slow neutrons, Fermi obtained the two transuranium elements whose atomic numbers are 93 and 94, respectively. Further research on artificial radioactivity was done in 1936–1938 by M. Ageno, Gilberto Bernardini (1906–), D. Bocciarelli, Z. Ollano, G. P. Occhialini, C. Perrier, N. B. Cacciapuoti, and others, who made it possible to obtain radioactive isotopes of various elements. It is fitting to recall at this point the studies of cosmic rays begun in 1930 by Bruno Rossi (1905–) of the University of Padova, who eventually left Italy for racial reasons and taught at Cornell University.

The forced departure of Fermi, Rasetti, and others, as well as the growing attraction exercised on younger scholars by the immense possibilities of work in the United States, posed problems of great importance in the postwar period.

MICHELE GIUA,
Member of the Italian Senate; Professor of Industrial Organic Chemistry, University of Turin.

9. ECONOMIC STRUCTURE AND PROBLEMS. The traveler in Italy, who is generally attracted by its natural and artistic beauties, historic places, and mild climate, seldom forms a

clear picture of economic conditions. Moreover, the main arteries of communication take him through the most active and prosperous sections of the country. He is therefore inclined to adopt the romantic and literary view, which only the vicissitudes of World War II to some degree corrected, that Italy, in spite of the burden of its history, is so favored by nature as to reap easily the benefits of modern technical progress. In reality, conditions vary so greatly even within a single region that highly contradictory conclusions may be formed. Striking contrasts may be found by anyone who travels from the orange-laden Conca d'Oro (Golden Bowl) surrounding Palermo to the nearby Sicilian hinterland; from the fertile Campanian country just back of Naples to Gaeta, in Latium; from the plains of Lombardy to the overhanging Alpine valleys; and from Genoa, Bologna, or Florence across the rugged Apennines. There are numerous other examples available to the conscientious observer of the Italian countryside, one of whose charms is its variety.

GENERAL FEATURES OF THE ITALIAN ECONOMY

Natural Resources.—The variety of the Italian economy stems first of all from environmental conditions. The climate, for instance, is characterized by unfavorable distribution and great irregularity of rainfall. Particularly in the south vegetation suffers from excessive rains in autumn and winter and drought during the balance of the year. This fact, coupled with a lack of irrigation, is an obstacle to intensive cultivation. Other limitations are caused by geological conformation: more than 40 per cent of the land is mountainous; only 20 per cent, plain. Moreover, the plains of the peninsula are crossed by narrow streams which are not generally useful for irrigation. The only exception is the Po River valley, one of the most productive sections of the country, which owes its development to hundreds of years of efforts to perfect irrigation and farming. Even here, however, the highest part of the valley and the Venetian plain which continues it have comparatively poor soil. The mountainous areas in many places allow for intensive cultivation of grapevines and olive and fruit trees, but the type of soil (generally sandy, clayey, or stony) does not facilitate agricultural development. (See also section on *The Land*.)

Another grave obstacle to a strong economy is the lack of minerals. In 1948, for example, Italian mines produced 974,000 metric tons of coal and 901,200 metric tons of lignite, while 8,302,291 tons of coal were imported. In 1938, 11,921,747 tons were imported. (During World War II, a maximum annual production of 2,305,200 tons of lignite and 2,520,000 tons of coal was achieved.) Lead and zinc are mined, particularly in Sardinia, as well as iron, iron pyrites, and mercury. Copper and other metals exist only in negligible quantities. Sulphur is abundant, but the mines operate under difficulties.

The Italian economy is also hampered by a lack of easy means of communication, particularly by river, and by the fact that the country is not situated on the main world trade routes. Finally, the country lacks the major raw materials essential to an industrial economy: rubber, cotton, wool, timber, cellulose, and oil. (There is, however, some natural gas, of which 108,200,000 cubic meters were produced in 1948. Promising discoveries were made near Piacenza in June 1949.)

These factors have restricted Italy in large part to agriculture, despite the unfavorable conditions of the terrain for intensive cultivation.

Population and Employment.—The scarcity of natural resources is accompanied by a very dense population, which increased from 23,617,153 in 1848 to an estimated 46,403,000 in 1948, or to an average of 399 persons per square mile. This is a high figure in an absolute sense, and it is even higher when we consider the available agricultural and forest land, of which only 52 per cent can be used for intensive cultivation. In a prevaingly agricultural country, this density of population retards the modernization of farming techniques and prevents the absorption on the land of a constantly increasing population. As a result, few more people were engaged in agriculture in 1949 than there had been 70 years before.

Of the 42,918,726 persons listed in the census of 1936, 18,345,432, or 42.7 per cent, were gainfully employed. The proportional distribution of the working population in 1936, as shown in Table I, remained substantially the same in the period following World War II.

Table I—EMPLOYMENT IN ITALY, 1936

Field	Number employed	Percentage of total	Percentage of independent workers in field
Agriculture, hunting, fishing.....	8,842,785	48.2	72.0

Public administration.....	808,866	4.4	..
Other.....	868,107	4.7	.1
Total.....	18,345,432	100.0	48.5

Italy's poverty in natural resources, a scarcity of savings available for capital investment, and the growing population are responsible for a sizable permanent unemployment. World War II aggravated this problem by causing extensive damage to plants and equipment and by increasing the number of women in factory employment. As of April 1949, there were 1,753,600 unemployed persons in Italy. (The number of persons on state and town relief rolls as of June 30, 1949, was 3,564,142.) In order to absorb all of them into the national economy, a capital investment of 4,000 billion lire¹ would be required. Moreover, it would be necessary for the world market to accept the resulting increased production, the greater part of which would have to be exported in order to pay for the required raw material imports. After World War II the Italian government endeavored, with United States aid, to alleviate the unemployment situation. The problem cannot be solved, however, without sizable emigration. (See section on *The People*.) There is also some hope of relieving the pressure of excess population by an international program of employment for Italian labor, and we must also note that the excess has been caused largely by a decline in the death rate (from an average of 19.1 per 1,000 in 1911-1915 to 10.6 per 1,000 in 1948). Moreover, in the same period the birth rate declined from an average of 31.5 per 1,000 to 21.5 per 1,000.

¹ In June 1949, 1 lira = 0.1739 cents in U.S. money; in November 1949, 0.1601 cents.

Development of the Italian Economy Since 1870.—Political factors have alternately arrested, stimulated, and altered the trend of production in Italy. The country did not attain final unity and political independence until 1870, and then only after a long and painful struggle against foreign and domestic enemies. Following unification, consolidation of the new government took precedence over economic development.

In 1870 the economy of Italy was overwhelmingly agricultural, and the scarcity of natural resources, lack of capital, high taxes, poverty of the great mass of the peasant class, lack (except in a few northern cities) of a commercial middle class prepared to organize bold new enterprises, and the inheritance of an antiquated social system from the various states into which the country had been divided, all these factors were responsible for a lag in industrial and general economic progress which required long years and much sacrifice to overcome. The critical circumstances under which the Italian nation was born are reflected in the lack of increase in agricultural production, in spite of an increase of population, and in emigration on a scale so large as to take on the character of an exodus, comparable only with that from Ireland (see Table 2).

Table 2—AGRICULTURAL PRODUCTION
AND EMIGRATION, 1876-1905

1876-1880.....	...	108,600
1881-1885.....	100	153,400
1886-1890.....	93	221,600
1891-1895.....	89	256,400
1896-1900.....	91	310,400
1901-1905.....	111	553,200

¹ Index: 1881-85 = 100.

² Temporary and permanent.

This initial crisis, superimposed on adverse circumstances, greatly retarded industrial development. Domestic purchasing power was low, and the free-trade policy in force until 1887 opened the doors to long-established foreign products with which Italian handicraft enterprises and newly established factories could not hope to compete. The risks encountered by any new enterprise were great. Moreover, the abolition of internal customs duties among the former states of the peninsula had destroyed industries which had depended upon them for protection.

Nevertheless, the general political upheaval, the increase of travel and trade from one region of the country to another, the growth of population, and the greater frequency of contacts with other countries paved the way for an industrial

development which culminated in the years immediately preceding World War I. By 1898 production in all fields was increasing, and between 1898 and 1913 imports of raw materials increased by 70 per cent. The index of economic activity prepared by the economist Giorgio Mortara shows an equivalent rise for this period.

The economic trend from 1871 to 1913 is reflected in the changing character of Italian foreign trade, as shown in Table 3. By 1911-1913 imported foodstuffs and manufactured goods were proportionately in lesser demand than raw materials, and the export of manufactured products had taken precedence over that of food. In the same period, Italy's international exchange picture was transformed in another way. Until the end of the 19th century, Italy had an unfavorable balance of international payments, but thereafter tourist expenditures and emigrant remittances helped substantially to make up the deficit.

World War I and the ensuing political unrest had an important influence on the Italian economy. The harmonious development of the first decade of the 20th century was arrested, and only in 1923-1924 did national income regain the level of 1909-1913. Important changes took place in the industrial field. Before the war the textile industry (according to the census of 1911) employed a third of the country's industrial workers. As a result of the wartime demand for armaments, the group of industries in the mechanical field (machinery, motor vehicles, ships, aircraft, tools, motors, engines) took first place, and there was a corresponding increase in the industrial application of power. Between 1911 and 1927, the installed horsepower of nonelectric primary motors increased from 1,620,404 to 5,468,588; and that of electric motors in industry, from 586,161 to 2,642,860. The number of corporations increased from 2,189 in 1914 to over 4,000 in 1921, and between 1911 and 1921 the number of industrial workers went from 3,600,000 to more than 4,000,000. Unrest and the collapse of some insecure war industries lowered production in the immediate postwar period, but industrial development resumed thereafter, and by 1927 there were approximately 8,000 corporations with a capital investment (in lire at their 1913 value) twice as large as that of prewar corporate investment.

The economic crisis of 1929 had its effect on the Italian economy, which was further altered, particularly after the outbreak of the Italo-Ethiopian War in 1935, by the Fascist policy of autarchy, or economic self-sufficiency. This policy made free trade impossible and caused the emergence of new industries which could not have existed without government protection, thus stimulating an additional, though artificial, growth of industrialization. The deficit in the interna-

* 1871-73 = 100.

tional balance of payments, which amounted to about 6 or 7 billion lire annually from 1922 to 1929, declined in the 1930's to approximately 3 billion lire annually (exclusive of colonial trade, which was distinctly favorable to metropolitan Italy). Imports of raw materials increased, both absolutely and relatively, compared with those of manufactured products, and there was a corresponding increase in the export of manufactured products. By 1938, the index of industrial production had risen to 243 (1922, the most inactive year of the immediate postwar period, = 100).

The direction of Italian industrial development from 1900 to 1939 is illustrated by Table 4,

Table 4—INDEX OF AVAILABLE INDUSTRIAL POWER
(Base, 1905-09 = 100)

1900-04	69
1905-09	100

1915-19	116
1920-24	155
1925-29	201
1930-34	210
1935-39	260

which gives the index of available power, from all sources, for this period. This remarkable industrial progress was not matched by agricultural production, nor by the income of the average Italian, which is indicated by the average per capita daily consumption of calories (see Table 5).

Table 5—AGRICULTURAL PRODUCTION AND FOOD CONSUMPTION

Years	Average daily calories per capita	Agricultural production index *
1911-15	2,568	100
1916-20	2,596	101
1921-25	2,780	108
1926-30	2,883	112
1931-35	2,619	102
1936-40	2,652	103

* Base, 1911-15 = 100.

The damage inflicted by World War II on the Italian economy was enormous. Agricultural production in 1945 was only 60 per cent of that of 1938, and industrial production, which in 1945 was almost completely paralyzed, had in 1946 reached a level of only 65 per cent of that of 1938. The number of livestock had been reduced by 30 per cent, the railways were running at only 60 per cent efficiency, and only 15 per cent of the merchant marine had escape destruction. Buildings, both public and private, were extensively damaged. (Approximately 2,625,000 rooms were either destroyed or so badly damaged as to require rebuilding, and an additional 3,300,000 rooms suffered repairable damage.) Besides material losses and a consequent social upheaval, prices rose to more than 50 times their average prewar value (see Table 7, below), the tax system was disrupted, there was a large deficit in the national budget (in 1945-1946, this amounted to 357 billion lire), and there was an equally serious deficit in the balance of payments. It was very difficult to maintain even the minimum amount of food provided for in the rationing system, and the lack of raw materials forced many industries to dismiss their employees. This postwar crisis was overcome in large part by aid from the United States. Before the end of the war, the Allied armies had given various forms of aid.

This was succeeded by the work of the Allied Control Commission and, from March 1945, by that of the United Nations Relief and Rehabilitation Administration (UNRRA). By means of an aid agreement signed July 4, 1947, the United States distributed \$121,000,000 worth of supplies, and by the interim aid agreement of Jan. 3, 1948, an additional \$200,000,000. In all, from the beginning of 1947 to March 31, 1948, which marked the beginning of the European Recovery Program (ERP), \$820,000,000 worth of goods was given to Italy. To foodstuffs were added raw materials, thus enabling industry to resume production.

Meanwhile, the Italian government took an active part in the restoration of public services. Of the 22,955 kilometers of railways in service in 1939, 21,013 kilometers were in operation by 1948. By Jan. 1, 1949, the merchant marine totaled 2,275,272 tons, or about 67 per cent of the prewar figure. The roads, of which about 15,000 kilometers had been damaged, were restored to good condition, with the building of 3,300 bridges (of which 1,500 have a span greater than 10 meters), as well as tunnels, embankments, and repair shops. (Italy has a highway system totaling about 109,000 miles, including national, provincial, and local roads.) About 55 kilometers of harbor works were repaired, and 7,000 hospital rooms, 2,500 school rooms, and numerous other public buildings were rebuilt.

The arrest of Italian production, the exhaustion of reserves, and the necessity of importing large quantities of food created problems whose gravity is apparent from the figures, as estimated by the Bank of Italy, on the international balance of payments, which are shown in Table 6. The

Total deficit	—\$788,800,000	—\$272,700,000

* Including \$62,000,000 worth of surplus property sold in Italy.

deficits given for 1947 and 1948 may be compared with that of \$38,000,000 for 1938. This situation was met without a disastrous reduction of imports through United States aid. In 1948, exports amounted to \$1,067,600,000, and imports to \$1,388,000,000, exclusive of freight and insurance charges. Under ERP, designed to restore economic activity and to stimulate international trade, assignments to Italy through May 31, 1949, amounted to \$668,000,000, and paid exports to \$397,900,000. In the period from June 1948 to June 1949, ERP imports represented more than 25 per cent of the total of imported goods. The most important items were cereal products (more than 50 per cent of those imported), coal (50 per cent), petroleum products (62 per cent), and cotton (51 per cent). In addition, the United States lent Italy \$67,000,000. The counterpart fund built up in lire from the sale of ERP goods permitted Italy to undertake an extensive public works program, including rail-

roads, public buildings, shipping, and irrigation and reclamation projects, especially in the south.

Financial Factors.—In 1937, the lira was valued officially at 19 to the U.S. dollar; in 1943, the official exchange rate was set at 100 lire to the dollar. As inflation increased, the rate was raised, first to 225 (January 1946), and then to 350 (August 1947). Finally, in November 1947, the government exchange bureau was authorized to acquire 50 per cent of the foreign money derived from exports on the basis of the free market rate of the preceding month. The difference between the free and official rates declined, and in 1948 the exchange rate was stabilized at 575 lire to the U.S. dollar. Following the devaluation of the pound sterling in September 1949, the value of the lira declined; in November 1949 the rate was 624.5 to the dollar. For a comparison of monetary circulation, wholesale prices, and the cost of living in 1938, 1946, 1947, and 1948, see Table 7.

Table 7—MONETARY CIRCULATION, WHOLESALE PRICE INDEX, AND COST OF LIVING INDEX, 1938-48

Year	Circulation of lire (in billions) at year's end	Monetary circulation index	Wholesale price index	Cost of living index
1938.....	22.5	100	100	100
1946.....	512.7	2278	2884	2823
1947.....	795.0	3533	5159	4575
1948.....	970.0	4310	5443	4844

By 1949 the rise in prices had been checked. Imports and the gradual increase of domestic factory production enabled the Italian government to pursue a firm stabilization policy. Rationing was almost entirely eliminated, and the black market in commodities disappeared. The deficit in the national budget was reduced from 787 billion lire for the fiscal year 1947-1948 to 481 billion lire for 1948-1949, with an estimated deficit of 174 billion lire for 1949-1950. In spite of the high level of government expenditures (1,548 billion lire in 1947-1948, and an estimated 1,252 billion lire in 1948-1949) compared with a national income of approximately 5,400 billion lire (1948), there is a gradual but steady increase of government income. In 1947-1949, the monthly tax revenue rose from 50 billion lire to 80 billion lire. The government's stabilization policy also had the effect of increasing the proportion of the national income devoted to new savings and investments, which in 1948-1949 amounted to about 13 per cent, compared with about 10 per cent before World War II. Because of the low average income,² however, the volume of savings in Italy has never been large, but monetary stabilization was a strong incentive for the rebuilding of savings lost during the war.

In 1948, real national income was approximately 90 per cent of its 1938 level (84 per cent if allowance is made for the increase of population during the decade). In its report for 1947-1948, the Bank of Italy estimated the national income, in 1948 lire, at 6,000 billion lire in 1938, 5,050 billion lire in 1947, and 5,400 billion lire in 1948. The value of available goods and services

for 1948 is shown in Table 8, and their distribution in Table 9. The distribution of the 1,310,-

INDUSTRY

Italian industry is characterized by a large number of small enterprises, sizable government participation, and great concentration in a number of important sectors.

General Features.—According to the 1937-1939 census of Italian industry, there were 1,022,539 active businesses with 4,373,652 employees, or an average of 4.2 per business. Of the total, however, 804,646 businesses were handicraft enterprises, and only 217,893 were industries in the technical sense of the word. The latter employed 3,154,394 persons (or an average of 14.5), of whom 2,809,730 were factory workers. Distribution of employees in the various fields of production is shown in Table 11. The difference

* 1938 value.

between the totals given in the table and those of the 1936 census (see Table 1 and section on *The People*) is accounted for by the fact that

² Colin Clark in *The Economics of 1960* (New York 1942) gave the average annual income of an employed person in 1935-1938 as \$410 in Italy, \$804 in France, \$1,206 in the United Kingdom, and \$1,389 in the United States.

the census included domestic workers, workers in military service (of whom there were large numbers in 1936), and unemployed.

Excluding handicraft industries, 85.9 per cent of the business enterprises in the 1937-1939 census had less than 10 employees (14.4 per cent of the total number of employees); 10 per cent had from 11 to 50 employees (17.5 per cent of the total); 2 per cent had from 51 to 100 employees (11 per cent of the total); 1.8 per cent had from 101 to 500 employees (27.2 per cent of the total); 0.2 per cent had from 501 to 1,000 employees (11 per cent of the total); 0.1 per cent had 1,001 to 2,000 employees (9.6 per cent of the total); and only 87 enterprises had more than 2,000 employees (9.3 per cent of the total). Small and medium-sized enterprises prevail except in metallurgy, the production of electric power, and a few chemical products.

The prewar capital investment in industry was estimated at 110 billion lire (1938 value), of which two thirds was in corporations. In 1938 only nine corporations had a capital of more than 500,000,000 lire; they accounted for 21.6 per cent of all capital invested in corporations. In contrast, 96 per cent of the corporations had a capital of less than 10,000,000 lire; these comprised 20.75 per cent of the total corporate capital. Up to 1914 foreign capital was heavily invested in Italian industry. The amount of this capital declined after World War I, particularly after the Fascist government inaugurated its policy of autarchy, and just before World War II it amounted to 12 per cent of the corporate capital.

The Role of the Government.—The direct participation of the government and of governmental agencies in Italian industry is relatively large. The government began to play an important role at the time of the economic crisis of 1929, and its intervention in industry increased for political reasons in the period 1935-1940. This participation assumes four principal forms.

Government Administration.—The Italian government directly administers arms and munitions factories, naval shipyards, some chemical laboratories and mechanical enterprises, the mint, various mineral bath establishments, public works projects, and a few specialized plants, such as those devoted to the restoration of national monuments and to engraving.

Government Enterprises.—There are various autonomous agencies of the government, of which the chief is the Italian State Railways, controlling 73 per cent of the total railway mileage and large repair shops, and employing 200,000 persons. The next largest is the state monopoly of tobacco, salt, and quinine, with its farms, refineries, and laboratories. In addition, part of the telephone system is run by the government.

Government Ownership.—The role of the Italian government as a stockholder was developed during the Fascist regime. In this period the government acquired all or part of the stock of a number of companies which maintain a legal status of private ownership. Apart from the Istituto per la Ricostruzione Industriale (Istituto for Industrial Reconstruction, IRI), there are 30 such companies with a capital of 2,600 million lire (1938 value) and 30,000 employees. They include the Cogne Corporation, which is engaged in the mining of iron and coal and the production of iron and steel and employs 5,400 persons; the Azienda Generale Italiana Petroli (Italian General Oil Corporation, AGIP),

which refines, produces, and distributes petroleum and petroleum products; and the Azienda Nazionale Idrogenazione Combustibili (ANIC), owned by the government and the Montecatini Company, which produces gasoline and lubricating oils. AGIP and ANIC together have 7,000 employees. These two companies were instruments of the Fascist policy of autarchy in the field of fuel.

Public Corporations.—In addition to the foregoing, there are the semigovernmental enterprises, which, though publicly managed, are not part of the government proper. Chief among them is IRI, which owes its creation to a law of Jan. 23, 1933, designed to aid three large banks which had been affected by the depression of 1929. In 1949, the enterprises controlled by IRI had 234,900 employees and constituted the most important group of Italian industries. The distribution of this group among various fields of production is shown in Table 12.

Table 12—ISTITUTO PER LA RICOSTRUZIONE INDUSTRIALE

Field	Principal enterprises	Number of employees
Shipping.....	Finmare, a financial group controlling the four main Italian steamship companies.....	18,200
Mechanical.....	Shipyards (Ansaldo, Adriatico, OTO, Navalmeccanica) and others (Alfa Romeo, San Giorgio)....	101,200

Chemical.....	Cellulose, synthetic rubber.	3,000
Land reclamation and other projects.	Sardinian, Maccarese, and Italstrade projects.....	19,400
Total.....		234,900

Scope of Government Intervention.—Government-controlled companies produce 85 per cent of Italian anthracite coal, 80 per cent of lignite, 65 per cent of mercury, 30 per cent of zinc, 15 per cent of lead, 80 per cent of pig iron, 65 per cent of steel, 80 per cent of ship construction, and 24 per cent of electric power. They manage 80 per cent of the telephone service, 40 per cent of all water transportation, and 73 per cent of the railway mileage.

Industrial Concentration.—Another aspect of the Italian industrial picture requires clarification if data on the prevalence of small and medium-sized enterprises is not to be subject to misinterpretation. This is the concentration of industry,

Table 13—CONCENTRATION OF ITALIAN INDUSTRY

Field	Number of large companies	Percentage of production controlled
Lead and zinc.....	6	92
Aluminum.....	3	95
Mercury.....	1	70
Coal.....	3	86

Caustic soda.....	4	90
Synthetic ammonia.....	2	86
Artificial textile fibers.....	2	90
Automobiles.....	2	84
Ball bearings.....	1	90
Matches.....	1	81

from both a technical and a financial standpoint, in a very few hands. Technical concentration is particularly pronounced in the mineral, iron and steel, electrical, and rubber industries, in shipbuilding, and in certain mechanical and chemical enterprises. The major examples of this concentration are shown in Table 13. Equally worthy of note is the concentration in the sugar, gas, and paper industries.

From a financial standpoint, besides the IRI group, described above, there is great concentration of capital in the production of electricity, the four major groups, which control 76.5 per cent of production, being connected with two large financial groups; and in the telephone service, largely controlled by IRI and two large private groups. Four industrial groups deserve special mention: (1) in chemicals, controlling 67 per cent of total production; (2) in the automotive industry, controlling 80 per cent; (3) in rubber, controlling about 70 per cent; and (4) in rayon, controlling 65 per cent. There are other large groups in the gas, coke, sugar, paper, and cement industries. In the textile industry there is far less concentration.

The total nominal capital of the enterprises listed above is about 200 billion lire (1949 value), compared with a nominal value of 337.8 billion lire for the 123 corporations listed by the Milan Stock Exchange.

In addition, there is a network of trusts, some of which were established by private interests and others through government action, all of them favored by protective tariffs. The most important are in the iron and steel and other metal industries.

After 1935, and to an even greater extent during World War II, many new organizations were created for the purpose of importing and distributing raw materials. The most important dealt with fuel. These excrescences, which may have been justified by an abnormal domestic market but which hindered healthy commercial development, were being abolished, slowly and with difficulty, after the war.

In general, although the larger groups have made sizable contributions to the development and renewal of productive equipment, the excessive concentration in the major sectors of Italian industry has had an unfavorable effect on the economy of the country.

Raw Materials.—We have seen that a scarcity of raw materials is a major characteristic of the Italian economy. Moreover, lack of capital and restriction of foreign trade have prevented the growth of plants processing imported supplies, such as are found in other countries equally poor in raw materials. One of Italian industry's most difficult problems has always been that of supply. The scope of this problem is shown by the following statistics for fuel, textile, metal, and other raw materials.

Fuel.—In Table 14 are given comparative figures of the amount of foreign and domestic coal, electric power, and petroleum consumed in Italy in 1926–1930, the period of maximum productive activity between World Wars I and II, and in 1936–1938, when the policy of autarchy prevailed. It is evident that in the second period a tremendous effort was made to achieve a certain independence from imported sources of power, but it is equally obvious that, despite drastic government intervention, this effort was not successful. After World War II, production

of electric power increased; in 1948, it amounted to approximately 22,692,000,000 kilowatt hours.

Table 14—SOURCES OF POWER, 1926–30 AND 1936–38

Source	1926–30		1936–38	
	Quantity*	Percentage of total calories	Quantity*	Percentage of total calories
Foreign coal..	13,310	84.3	11,441	71.1
Domestic coal..	1,031	4.3	1,991	8.2
Electric power..	8,503	6.2	14,628	10.4
Petroleum, gasoline and naphtha	609	5.2	1,258	10.3

* Coal and petroleum in thousands of metric tons; electric power in millions of kilowatt hours.

Textiles.—Cotton imports reached a high point of 220,000 metric tons in the period 1926–1930. The development of the manufacture of artificial textiles and limitations imposed upon the use of cotton reduced cotton imports to an average of 140,000 metric tons in the period 1935–1938. In 1948, 138,889 metric tons were imported. The reduction of cotton imports was made up by large imports of cellulose for the production of artificial fibers; these amounted to 145,429 metric tons in 1938, and 35,305 metric tons in 1948.

Wool, too, must be almost entirely imported. Italy received 60,763 metric tons of foreign wool in 1948. Among the less important textile fabrics, hemp is grown in sufficient quantity in Italy, but jute is almost entirely imported (25,427 metric tons in 1948). Domestic flax meets part of Italian requirements.

Metals.—In 1938, Italy imported 621,327 metric tons of iron and steel scrap, 69,878 metric tons of pig iron, and 184,268 metric tons of iron and steel products. Corresponding figures for 1948 were 122,722, 132,387, and 241,617 metric tons, respectively. Despite an increase in aluminum, lead, and zinc production in the decade before World War II, and measures taken by the government to limit the consumption of copper, this last especially has been imported in large quantities, amounting in 1938 to 80,612 metric tons (copper and copper alloys), and in 1948 to 70,874 metric tons. Nickel, tin, and antimony are also imported.

Other Raw Materials.—Other imported raw materials particularly necessary to Italian industry are rubber, wood, pulp, oilseeds, and phosphate rock.

Industrial Production.—By 1949 the industrial production index had recovered to approximately 95 per cent of the 1938 level. Production in the major fields of Italian industry is described below.

Metallurgy.—The iron and steel industry had before World War II reached a stage of development in keeping with domestic requirements, with a productive capacity of about 3,000,000 metric tons of steel and 1,500,000 metric tons of pig iron per year. In 1938, there were 19 blast furnaces, 5 of which were electric; 110 open-hearth furnaces; and 126 electric furnaces. About 84 per cent of production was concentrated in the plants of large combines. Many of the problems of a modern iron and steel industry have not been met; among other things, there is need for a reorganization of the plants producing steel plate.

In 1938, 928,800 metric tons of pig iron and ferroalloys and 2,328,000 metric tons of steel ingots and castings were produced. Corresponding figures for 1948 were 525,600 and 2,124,000 metric tons, respectively.

The manufacture of wire and nails is divided among a number of small companies. The same is true of secondary smelting plants, of which there are about 300, with 25,000 employees.

The aluminum industry, which grew considerably after World War I, is concentrated in four plants which process domestic bauxite and together have a capacity of 60,000 metric tons per year. From a maximum production of 48,195 metric tons in 1941, there was a decline to about 4,200 metric tons in 1945 and a rise to 33,000 metric tons in 1948. Increasing production depends upon the availability of cheap electric power.

The old-established lead and zinc industries, supplied from Sardinian mines, were extensively developed in the decade before World War II. There are three primary lead-smelting plants, with a capacity of 100,000 metric tons a year. In 1938, they produced 44,040 metric tons, and in 1948, 26,400 metric tons. The four Italian zinc plants have a capacity of 45,000 metric tons. Their maximum production (1940) was 39,360 metric tons; that of 1948, 26,630 metric tons.

Other branches of the metallurgical industry are unimportant if we except a few plants for the fabrication of imported copper and the production of mercury. In 1938, 2,027 metric tons of mercury were produced; in 1947, 1,861 metric tons.

The mining industry, except for the mines supplying the plants described above, was passing through a crisis after World War II, partly because its earlier prosperity had been bound up with the Fascist policy of autarchy. This was particularly true of coal, but applies equally to crude sulphur (380,345 metric tons in 1938, and 147,329 in 1947) and marble blocks (323,089 metric tons in 1938, and 263,646 in 1947). Production of iron ore amounted to 989,793 metric tons in 1938, and 454,300 in 1948; that of iron pyrites, to 930,312 metric tons in 1938, and 629,750 in 1947.

Industries in the Mechanical Field.—Together, the mechanical industries occupy first place in the Italian industrial picture, and chief among them is the manufacture of motor vehicles. In 1938, Italy produced about 52,000 passenger cars and 10,000 trucks; in 1948, 44,425 cars and 15,548 trucks and buses. In addition to the large automobile plants, there is a flourishing group of smaller body manufacturers whose craftsmanship is highly regarded in foreign countries. The production of bicycles and motorcycles increased after World War II, reaching 120 per cent of the 1938 level in 1947.

The manufacture of aircraft, which grew during the war until it numbered 150,000 employees, was in a process of reconversion after the war. In 1947, only 125 planes were produced.

There are 160 privately owned shipyards with 50,000 employees and a capacity (exclusive of wood bottoms) of about 200,000 gross tons per year. Even before World War II, their capacity was never fully exploited despite government subsidies. The four largest manufacturers of ship engines have a combined capacity of 500,000 horsepower-years in turbines and 300,000 horsepower-years in motors.

After World War II, the Italian railway machine shops were very busy replacing lost equipment. These shops, which are perhaps overly subdivided (there are 93, with 20,000 employees), have a combined capacity greater than that normally required by the Italian railways. Before the war they suffered from periodic difficulties, in which plants were shut down and the largest shops combined in order to secure export outlets.

The electromechanical industry is an active one, represented by four major firms, special departments in other mechanical industries, and numerous small and medium-sized plants. In all, they employ 70,000 workers. Widespread electrification has made for a large production of generators, transformers, motors, and all the equipment necessary to the production, distribution, and use of electric power. There has been an equal growth in the production of cables and conductors (17 plants with more than 5,000 employees), batteries, light bulbs (60,000,000 produced annually), and telephone material. The manufacture of precision tools also is prosperous.

Textiles.—The second largest Italian industry is that of textiles, with 6,000 factories and 600,000 employees, in addition to numerous small handicraft units. Textiles have been since the Middle Ages an Italian specialty, with silk enjoying a particularly long tradition. The chief textile centers are Prato, in Tuscany, and the regions around Milan, Biella, and Vicenza.

Silk manufacture is the most important and is supplied by the domestic output of cocoons, of which an estimated 9,000,000 were produced in 1948. Unfortunately, this industry declined noticeably after 1930. Many spinning establishments located near the mulberry groves closed down, but some plants specializing in the later processes of manufacture were modernized.

As silk declined, there was an increase in the manufacture of cotton cloth. Despite the destruction caused by World War II there were at the end of 1947, 5,301,663 spindles and 138,276 looms. The industry employs some 200,000 workers. The production of both yarn (200,000 metric tons) and cloth (in the best years, 900,000,000 meters) is larger than the domestic market can absorb. Both silk and cotton goods require an export market.

In spite of war damage the 1949 capacity of the wool industry was on a par with that of 1939. As of 1939, there were 1,162,244 spindles and 19,455 power looms. There are about 70,000 employees, of whom 20,000 produce yarn, 5,000 work in combing, 40,000 in weaving, and the remainder in various allied lines. Plant capacity totals 30,000 metric tons of yarn, 20,000 metric tons of combed wool, and 40,000 metric tons of cloth. In 1947, the mills produced 40,000 metric tons of wool tops, 32,000 metric tons of worsted yarns, 50,000 metric tons of woolen yarns, and 50,000 metric tons of wool fabrics. The spinning and combing plants are concentrated in a few hands, but the weaving industry is more generally divided except for the large combines in Valdarno and Schio, near Vicenza. The plants around Biella are medium to large in size, and those at Prato small to medium. The wool industry also exports a large part of its output, particularly finished goods.

The newer rayon industry grew rapidly during the period of autarchy. As of 1949, it had 36,000 employees, who worked in 80 plants, of

which 30 produced fiber. There are 130,000 spinnerette machines and 736,000 twisting spindles. A maximum production of 200,000 metric tons was attained in 1941. Production in 1949 was only 50 per cent of capacity.

The less important manufactures of hemp, flax, and jute together employ 40,000 workers.

Clothing is not big business in Italy. Of the 308,723 persons listed in the industrial census of 1937-1939, only 105,100 were factory workers. There are, however, some large establishments producing carpets, hats, elastic fabrics, underwear, and stockings.

Chemicals.—While the textile industry has been stabilized since 1930, the chemical industry has grown rapidly. As of 1949, it had 150,000 employees. Typical is the increase in the production of sulphuric acid, which went from 660,000 metric tons in 1914 to 777,000 in 1922, 1,127,000 in 1928, and 1,889,000 in 1938. A similar advance took place between 1928 and 1938 in almost all branches of the chemical industry. Production recovered rapidly after World War II, and by May 1949 it had reached 99 per cent of the 1938 level.

Foodstuffs.—The production of food is an important branch of Italian industry. According to the industrial census of 1937-1939, it employed 574,473 persons, of whom 361,700 were factory workers, the balance working in numerous small units. The census of 1937-1939 listed 292,906 individual plants, far more than the 168,451 in clothing. There are, however, some large firms. Among them are the 54 sugar refiners with 43,000 employees and a daily capacity of 7,000 metric tons. These were hard hit by World War II but by 1949 had regained their prewar level of more than 300,000 metric tons of sugar a year. There are also sizable firms producing candy, preserves, cheese, wine, beer, and spaghetti.

Lumber.—The lumber industry is divided among 123,162 units, and although some of them (such as the factories producing furniture and plywood) attain considerable size, most are classified as handicrafts. In 1947, Italy produced 3,693,110 cubic meters of timber.

Leather.—Of the 123,804 units listed by the industrial census of 1937-1939 for the tanning and leatherwork industry, only about 700 can be classified as industrial. Italian leather goods, noted for their high quality, supply the entire domestic market and are also exported.

Rubber.—Rubber is a large-scale industry in Italy. There are 269 producing units with approximately 40,000 employees. In 1948, 31,841 metric tons of crude rubber were imported. In addition, there is some production of synthetic rubber. Consumption has been increasing, and the industry recovered rapidly after World War II, reaching 120 per cent of 1938 production by May 1949.

Paper.—There is an old tradition of paper-making in Italy. According to the industrial census of 1937-1939, there were 1,992 producers with 56,127 employees. Newsprint is produced in a few large establishments. The production of paper increased from 350,000 metric tons in 1929 to 470,000 metric tons in 1938. Production in 1947 amounted to about two thirds of the prewar level. In general, the industry is hampered by high prices and a scarcity of pulp.

Construction.—Although the building trades occupied 558,544 persons according to the 1937-

1939 industrial census, there are few large companies. In the postwar period, high costs and rent controls combined to produce a crisis in the building industry despite government intervention to stimulate the repair of war damage and the undertaking of public housing projects. All necessary building materials are produced domestically. The production of building stone and brick is divided among a large number of companies, but the cement industry is concentrated in a few hands. Cement capacity, which totals 7,000,000 metric tons a year, is utilized only in part. In 1947, 2,943,000 metric tons were produced; in 1948, approximately 5,000,000 metric tons.

Electric Power.—There are 320 electric power companies and 1,091 central power plants belonging to the 11 major groups which control 85 per cent of the total installed power capacity. About 90 per cent of the plants are hydroelectric, and two thirds of them use water from the Alps. There are about 100 reservoirs and artificial lakes with a combined capacity of almost 2,000,000,000 cubic meters of water. By 1949, all the damage caused by World War II, which was particularly heavy in central and southern Italy, had been repaired and new facilities were under construction. The 1948 production of 22,692,000,000 kilowatt hours of electricity exceeded the previous maximum of 20,760,000,000 kilowatt hours attained in 1941. It was twice that of 1929, and considerably above the 15,800,000,000 kilowatt hours produced in 1938. Nevertheless, the supply of electric power has been unable to keep pace with the demands of Italian industry. Plans were under way in 1949 to increase facilities so as to produce 30,000,000,000 kilowatt hours of electricity annually by 1954.

AGRICULTURE

Crop Distribution.—Because local conditions are so varied in Italy, existing agricultural statistics cannot be classified so as to present a thorough conception of crop distribution. By resorting to extreme simplification, however, it is possible to give an approximate idea of land uses in the mountain, hill, and plain regions, as shown in Table 15. The percentages in this table are based on the pre-World War II total of agricultural and forest land, which amounted to approximately 28,500,000 hectares, or about 70,500,000 acres. (According to the 1947-1948 report of

Table 15.—PERCENTAGE DISTRIBUTION OF AGRICULTURAL AND FOREST LAND

Land Use	Mountainous	Hilly	Plain	All Italy
Cultivated.....	26	49	70	45

Uncultivated but productive.....	32	15	5	19
.....	9	6	4	7
Total, uncultivated area.....	65	37	17	43
Total.....	100	100	100	100

the National Institute of Agrarian Economy, the total area of agricultural and forest land is 68,730,291 acres.) This roughly indicated division must be supplemented by a description of local conditions.

First, we must distinguish between the Po Valley and the peninsula proper. In the great plain of the Po, agriculture is very different from what it is beyond the Apennines, in central and southern Italy—the characteristically Mediterranean region from Emilia to Sicily. Northern Italy produces large quantities of grain (wheat, corn, rice, rye, oats, barley), industrial plants (sugar beets, hemp, tomatoes), and fodder (irrigated single-crop meadowland or meadowland rotated with different kinds of clover). Central Italy and most of the south are characterized by grapes, almonds, citrus fruits, green vegetables, and large quantities of olives. Everywhere wheat is the largest crop, since it furnishes the bread and spaghetti which, with olive oil, form the staple diet of the rural Mediterranean population. Some wheat is grown on almost every Italian farm. In the north it is a soft wheat from which bread flour is ground; in the south it is hard wheat with a high gluten content that is particularly adapted to the production of the various kinds of spaghetti. This hard wheat is an invaluable source of protein for people who do not eat much meat. The widespread cultivation of wheat, then, is due in large part to the nourishment it guarantees a peasant family. Aside from this general north-south division, the chief agricultural zones of Italy are indicated in Table 16. The divisions are based on the total prewar area of Italy (76,649,080 acres).

Table 16—PRINCIPAL ITALIAN AGRICULTURAL ZONES

Zone	Approximate area in hectares
Mountains (Alps and Apennines)	11,000,000
Outer Alps and plateaus	3,100,000
Po Valley, irrigated	1,000,000
Po Valley, nonirrigated	2,000,000
Central Italy	4,500,000
Southern Italy and Sicily	6,800,000
Sardinia	2,400,000
Total	30,800,000

Mountains.—The Alpine portion of the mountainous zone is composed of forest and grazing land. The land under cultivation amounts to no more than 7 per cent of the total and is divided among a number of small farms. The forests and pastures are usually owned collectively or by municipalities. The typical mountain dweller lives in a house in a village (which is located as often as not in a valley) only during the winter months. The rest of the year he spends in the upland pastures. Stock raising is his chief means of livelihood, and his modest crop of wheat, rye, and potatoes does not supply all of his family's needs. The living standard is low, and the population is sparse.

The mountainous area of the Apennines, on the other hand, is cultivated. Here a typical agricultural economy prevails. A denser population and the nature of the terrain have overstimulated cultivation. Livestock consists of sheep rather than cattle, and in some areas the flocks are moved back and forth from winter to summer pastures.

The mountains of Italy have long since lost their original forest covering. Most of the existing forests are grown for periodic cutting, and only a third of the forest area consists of tall

trees. The most favored sections of the mountainous zone permit the cultivation of fruit, and there are many chestnut groves.

Outer Alps and Plateaus.—In this zone we find small farm units consisting of patches of cultivated land, pasture, an orchard or vineyard, and a small tract of woods. The fields of grain are planted with mulberry trees, which formerly stimulated the cultivation of silkworms. These farms produce comparatively little, and few head of livestock are raised.

In a category by themselves are the hilly regions of Langhe and Monferrato, where fruit trees and grapes are cultivated intensively in a fourth of the area.

Po Valley, Irrigated.—The irrigated portion of the Po Valley, by virtue of the terrain, water supply, large-scale irrigation projects, and intensive cultivation, makes up the richest agricultural zone of Italy. Here we find grains cultivated in rotation with meadowland, and in some places permanent meadows. Livestock is raised on a large scale, and some areas specialize in a single crop, notably rice. Individual returns are high, and considerable sums of money are invested in this zone.

Po Valley, Nonirrigated.—The nonirrigated portion of the Po Valley is somewhat less fertile than the irrigated portion, but it is still intensively cultivated. Industrial crops (hemp, sugar beets, tomatoes), together with orchards and vineyards, prevail. In some reclaimed areas there are large commercial farms. Here there is a serious labor problem because the employment of farm workers is seasonal.

Central Italy.—Agriculture in central Italy is characterized by the system of *mezzadria*, or cropping on half shares. The crops vary from one area to another. Olives prevail in one section; grapes (Chianti, Orvieto, Val di Pesa), in another. In addition, fruit, grain, and vegetables are cultivated, and there are areas of forest or fallow land. The coastal plains of Tuscany and Latium have benefited from reclamation projects and raise grain on a large scale.

Southern Italy and Sicily.—This agricultural zone is greatly handicapped by a scarcity of water. Olives, grain, and grapes prevail in various districts.

Along the coastal plains of Sicily and the Adriatic and Ionian seas, as well as in some dry sections of the interior, there are latifundia, or large private estates, which are devoted to the cultivation of grain and the raising of livestock. Around the towns, on the other hand, landholding is on a tiny scale. Neither extreme is very profitable. Only in some irrigated coastal areas is there intensive cultivation of citrus and other fruits, vegetables, and some industrial crops, such as hemp, tomatoes, and tobacco. Wherever the land is least fertile, we find olives and grapes.

Sardinia.—Sardinia is in a category of its own because so much of it consists of poor pasture, scrub forest, and fallow land. The population is not dense, and ownership of what little land can be intensively cultivated is widely distributed. Investments are small. In the more favored areas we find crops similar to those of the southern part of the peninsula, with grapes and olives predominating.

Production.—The principal agricultural products of Italy are shown in Table 17, which compares the output of 1936-1939 with that of 1948. It should be noted that the harvest of 1948 was

Table 17—PRINCIPAL ITALIAN AGRICULTURAL PRODUCTS, 1936-39 AND 1948

Principal crops	Average 1936-39 (metric tons)	1948 (metric tons)
Wheat.....	7,550,800	6,136,000
Corn.....	2,960,100	2,254,000

Oranges.....	325,500	352,900
Lemons.....	326,900	254,600
Other citrus fruit.....	85,100	84,400
Other fruit.....	1,567,800	1,573,200

distinctly better than those of 1945-1947. The olive crop, however, was exceptionally poor because of adverse weather conditions. Normal oil production is more than 200,000 metric tons; that of 1947 was 258,000 metric tons. In the same year, 31,858,000 hectoliters of wine were produced. These and all other items vary considerably from year to year, depending on climatic conditions. The average wheat production is 1.5 metric tons per hectare for the entire country, with a maximum of 2.5 to 3 metric tons in Lombardy and a minimum of less than 1 ton in Latium, the south, and the islands. More than half the grain produced in Italy comes from the Po Valley and Sicily.

In 1939, Italy had approximately 7,879,000 cattle, 3,303,000 swine, 9,875,000 sheep, and 1,867,000 goats. Livestock numbers were cut greatly during World War II, but these losses were largely replaced, and as of 1949 it was estimated that there were 7,500,000 cattle, 3,800,000 swine, 10,000,000 sheep and goats, 700,000 horses, and 700,000 donkeys and mules. The last two are found particularly in the south, while most of the other stocks are in the Po Valley.

Compared with its population, Italy's livestock resources are very small. In 1947, Italy had 161 head of cattle to every 1,000 inhabitants, in contrast to 371 for France, 217 for Germany (Bizone), and 552 for the United States. If the numbers of Italian livestock could be substantially increased, both the standard of living and agricultural exports could be raised, thereby providing funds for badly needed imports. In 1938, food products, particularly grain and fats, made up 14.1 per cent of total imports by value; and 35.5 per cent of total exports (citrus fruit, other fruit, vegetables, and wine). Corresponding figures for 1948 were 46.4 per cent and 20.4 per cent, respectively. It is essential that Italy increase its agricultural production and find additional foreign outlets for fruit and vegetables.

Land Distribution.—Approximately 40 per cent of the productive land of Italy is occupied by small one-family farms, far from any market, which produce only enough to meet the family needs. Even within this category, however, there are marked differences that require further explanation if we are to see how the land is actually distributed and how the farms are run. In the period following World War II, the distribution of the population engaged in agriculture remained approximately the same as it was at the time of the 1936 census (see Table 18).

Table 18—DISTRIBUTION OF POPULATION ENGAGED IN AGRICULTURE, 1936

Around the villages of the Alpine valleys there are small farms, composed of patches of fields, meadows, vineyards, and woodlands, whose owners have a communal arrangement for sharing grazing land and forests in the mountains. The same sort of farm, of more recent origin, is characteristic of the Outer Alps and plateau zone. It is very often run by its owner, but is sometimes leased or farmed on shares. This condition also prevails among the Piedmont hills.

The farms of the Po Valley are frequently run by a lessee who hires the necessary labor. Where the land is rich, the workers receive regular wages and a percentage of the produce. In the nonirrigated or recently reclaimed areas, the work is done by seasonally recruited day laborers. In the Lombard plain a large number of the workers are migrants who come for the season, particularly to the rice fields. The condition of the day laborers is unfavorable because of the seasonal character of their employment with long intervening periods of unemployment, and because of their enforced absence from their homes while they are working. Large and medium-sized properties are the rule, although some small farms are found on the edges of the Po plain.

In central Italy, where the system of *mezzadria* prevails, the farm unit is called the *podere* and usually has an area of 20 to 50 acres, or enough to be worked by one peasant family. Larger properties, especially in Umbria and Tuscany, consist of 5 to 20 *poderi* grouped together in one *fattoria*, which is under the direction of either the landowner or his manager. This system is adapted to the terrain, which is often unsuited to the use of agricultural machinery, and to the fact that a constant investment of money is necessary in order to show a profit. Except in some small mountain areas large and medium-sized properties prevail in central Italy.

From the Maremma southward to the end of the peninsula, large-scale properties are more numerous, particularly where grain or livestock is the major interest. Where cultivation is more intensive, properties are likely to be smaller, and even in the south there are small farms, particularly in the mountains. In the far south and Sicily farms are not laid out in single units; instead, pieces of land are leased and subleased to the peasants. Large tracts are often leased to a wealthy operator who hires the necessary day labor for longer or shorter periods. The limited arable area of Sardinia, on the other hand, is broken up into small, poor units.

According to the report of the National In-

stitute of Agrarian Economy given in Table 19, 77.5 per cent of the agricultural and forest land is the property of individuals. The land owned by the various private and public bodies has an economic value below what might be expected from its size, representing 10 per cent of taxable

farm income as against 22.5 per cent of the agricultural and forest land area. Of the 9,512,242 individually owned holdings, 53.96 per cent have a size of half a hectare (1.235 acres) or less (see Table 20). About 74.1 per cent of the area individually owned is in units of less than 100 hectares (247.1 acres), and 4.1 per cent in units of over 1,000 hectares (2,471 acres). On the other hand, of the land owned by private and public bodies, holdings of less than 100 hectares account for only 13.8 per cent of the total area of such land. Individual holdings of agricultural and forest land are distributed as shown in Table 20. These figures, which apply to Italy as a

Table 20—DISTRIBUTION OF INDIVIDUALLY OWNED AGRICULTURAL AND FOREST LAND, 1947-48

Classification by hectares	Number of holdings	Percentage of total	Area (in hectares)	Percentage of total area
Up to 0.5.....	5,132,851	53.96	875,000	4.1
0.5-2.....	2,795,122	29.38	2,883,000	13.4
2-5.....	950,070	9.99	2,943,300	13.6

whole, are supplemented by statistics on taxable income divided by major agricultural regions (Table 21). Because of great variations in land productivity, taxable income is a more meaningful criterion of land distribution than area is. We learn from this data that the least valuable properties are found in greatest numbers in the mountains and in Liguria, the small- to medium-value properties in the northern hills and in Sardinia, the medium-value ones in the center and south and in Sicily, and the medium- to large-value ones in the Po Valley.

With regard to the land owned by public and private bodies, as shown in Table 19, 56.1 per cent of the total of such land belongs to municipalities, 9.6 per cent to commercial corporations, 8.7 per cent to the national and provincial gov-

Table 21—PERCENTAGE DISTRIBUTION OF TAXABLE INCOME, AGRICULTURAL AND FOREST LANDS, 1947-48

Zone	Taxable income, based on assessments as of Jan. 1, 1943, in lire at their 1938 value			
	To 1,000	1,000-10,000	10,000-100,000	Over 100,000

ernments, 7.4 per cent to the Roman Catholic Church and other religious bodies, 4.4 per cent to welfare organizations, and the balance (13.8 per cent) to peasant associations and other groups. Commercial ownership is found especially in the plains; communal ownership, in the mountains. Organizational ownership is most important in Trento, Latium, Umbria, Lombardy, and Tuscany.

Agricultural Problems.—The major problem of Italian agriculture after World War II was the return to normal production. Although this goal was well on the way to realization by 1949, there remained the problem of raising production above prewar levels in order to take care of the increased population and improve the average standard of food consumption.

A second group of problems is related to the necessity of adapting production to market conditions. During the Fascist regime, Italian agriculture aimed at national self-sufficiency and the extension of the acreage devoted to the cultivation of grain. Some of the circumstances that determined this policy—the difficulty of securing certain foreign supplies and of exporting fresh fruit, vegetables, and wine—still obtained after the war. Nevertheless, for Italian agriculture to prosper there must be freedom to concentrate on improving and increasing those types of cultivation to which soil and terrain are best suited, and to place the products of this cultivation on a free world market.

The large number of small holdings, the existence of a large class of farm laborers, and lack of capital make technical improvement difficult. There is much to be done in the development of professional instruction, in the provision of easier farm credit, and, eventually, in organizing cooperatives for the use of agricultural machinery and the processing and sale of farm products.

In addition to these technical problems, there are two social problems: overpopulation in certain areas, and the existence of approximately 2,000,000 farm laborers who have no economic security. The first, as explained above, is a general problem of the Italian economy, and its solution would require a number of long-range measures, such as greater emigration, emphasis on different types of crops, and further industrial development supported by new capital.

The problem of the *braccianti*, or laborer, is closely connected with overpopulation and with land distribution and farming methods. The

term *bracciante* includes both those whose work is seasonal and those whose wages are uncertain. There are, however, many different types of laborer. There is, for example, a tremendous difference between the employees of a large commercial farm of the Po Valley and the peasants of a large southern estate. In both cases, however, it is not sufficient to increase the amount of goods that the laborer can acquire with his wages. There is need also for some form of contract, whether tenancy or *mezzadria*, by virtue of which the farm worker can feel some ownership or at least participation, and also certainty of employment. For large masses of the rural population, that is the only way to achieve a better life. As conditions have existed, the peasant in some areas is caught in a vicious circle of poverty. The laborer in Apulia, for instance, has no share in what he produces and does his work slackly and reluctantly. Much energy is wasted because of the lack of incentive or any real connection with the land. Such conditions were responsible, for example, for the strike of about 1,000,000 farmhands in the Po Valley and central Italy in the spring of 1949.

Even when a peasant has saved enough money to buy his own farm, in those regions where large holdings prevail there has been no land on the market for him to purchase. For this reason, proposals for agrarian reform have long been made. As a matter of fact, agrarian reform has been under way for centuries, with the steady increase of small holdings and intensive cultivation. There are two chief aspects to the problem. First, there must be a change from extensive to intensive cultivation in certain areas, and, second, in areas where large holdings monopolize the land they must be broken up. In addition, the efficiency of the smallest type of landholding must be increased, and fairer leasing and sharecropping arrangements must be made where a further increase in the number of holdings is impractical.

Only in a part of central and southern Italy is there need for forced redistribution of the land. In many areas such parceling would reduce productivity. In a proposal made by the Italian government in April 1949, it was suggested that the excess land of extensively cultivated properties yielding a taxable income of more than 40,000 or 50,000 lire (1938 value), and intensively cultivated properties yielding more than 60,000 lire, based on assessments as of Jan. 1, 1943, be sold for redistribution over a specified period. Any such land remaining unsold would then be expropriated, its owners receiving compensation. It was expected that this plan would make available a minimum of 3,000,000 acres for redistribution.

10. POLITICAL AND ADMINISTRATIVE STRUCTURE. The study of Italian political problems and the description of Italy's constitutional and administrative structure fall properly into three main chronological subdivisions: (1) Italy under the Constitution of 1848, and until 1922, when the Fascists seized power; (2) the Fascist interlude, from 1922 to 1943; and (3) the period from the downfall of fascism in 1943 to the establishment of the Italian Republic in 1946 and the framing of a new constitution in 1947.

LIBERAL ITALY UNDER THE CONSTITUTION OF 1848

The Constitution of 1848, granted originally to the people of the Kingdom of Sardinia by Charles Albert (q.v.), became the constitution of the Kingdom of Italy upon its formation in March 1861, and was later extended to the entire peninsula as the process of unification proceeded. While the framers of the constitution had in mind the creation of a system of government in which the powers of the king would be quite broad and independent of Parliament, custom and the influence of the English system gradually led to the development of a parliamentary regime. The shift in emphasis from king to Parliament was achieved rather early. Indeed, the principle of the supremacy of Parliament, and of the primary responsibility of the government to Parliament, was already firmly established by the time of the death of the great builder of Italian unity, Camillo Benso di Cavour (q.v.), in June 1861.

Considering, then, the Italian system of government from 1861 to 1922 as a parliamentary monarchy, we can observe the following fundamental characteristics:

The Monarchy.—In general, the three rulers of this period—Victor Emmanuel II, Humbert I, and, until October 1922, Victor Emmanuel III (qq.v.)—behaved as expected of constitutional monarchs. Their task was to reign and not to rule, to keep wholly outside of politics, and to accept as mandatory whatever political move was dictated by the parliamentary majority of the moment.

Parliament.—Two houses existed throughout this period—a lower house, the Chamber of De-

puties, and an upper house, the Senate. The suffrage was not extended to all adult males (with the exception of illiterates under 30 years of age) until 1912, so that for the first half century the Chamber of Deputies was elected on a relatively narrow, though constantly widening, basis. (All literacy requirements for voting were finally abolished in 1919.) Senators were appointed for life by the king, upon recommendation of the prime minister. Effective political power belonged to the Chamber of Deputies; all cabinets had to seek its confidence and could be overthrown by it. The Senate's role was one of advice and, presumably, of debate of fundamental issues on a higher level.

Until 1919 the electoral laws were based on single-deputy constituencies. This meant the establishment of strong personal relationships between political candidates and the electors. The local ties, the family background, the personal views of a deputy mattered a good deal more than his membership in one or another political party. Italian political life at this period thus bears a strong resemblance to that of France, personal issues and attitudes being more significant than any steady attachment to rigid political programs. This was the era of transformism (see section on *History*), and to some critics of Italian politics the word bears vituperative connotations. It was, to be sure, a system which made for blurred party lines, and for insecure governments, because no government could count on the allegiance of well-disciplined ranks of supporting parties. Nevertheless, the system brought into political life a human touch and a sense of political realities which are missing when Parliament is rigidly aligned among great parties whose members have been reduced to the status of robots. The parliamentary history of this period, therefore, is known not through the vicissitudes of political parties but through those of political leaders, as they succeeded or failed in retaining a following sufficient to keep them in power. This is especially true of the period after 1876, when the Right was driven from office. The outstanding name of this period is that of Giovanni Giolitti, who served five terms of office as prime minister and knew better than anyone else how to manipulate parliamentary majorities with a cleverness which, while not contributing to the raising of the level of political morality, helped to maintain effective government.

After 1919, the political scene changed. The major cause was the war; the contributing cause, the revision of the electoral machinery. In Italy, as in most countries, World War I precipitated political developments whose formation would otherwise have proceeded at a much slower pace. Two of these developments were of major proportions, and such as to change the complexion of Parliament. The first was the birth of a full-fledged Christian Democratic movement; the second, the great increase in strength of the Socialist Party.

The appearance of Christian democracy, if sudden and dramatic, was not unforeseen. For several decades, the political, economic, and organizing activities of groups calling themselves Christian Democrats had been increasing. By the end of World War I it was apparent that the only factor withholding this movement from a public appearance on the political stage was the Vatican's veto against the participation of Catholics in the political life of the country. This

veto had gradually been softened to permit participation in local politics, but up to 1919 no national Catholic party could have been organized. When, during the war, the pope made it clear that the church, far from desiring the political destruction of Italy, favored the strengthening of the country and implied that the Roman question (see section on *History*) no longer had any real significance from a territorial point of view, the end was in sight. The dam was broken when the pope let it be known that he would not object to Catholics standing for office. In January 1919, the Italian Popular Party was formed. It won 101 seats in the election of 1919 and 108 in the election of 1921, becoming the second most important political party in the Chamber of Deputies.

The strongest was the Socialist Party. As a party it was committed to a revolutionary program and could, therefore, admit no compromise that entailed any degree of collaboration with the existing political regime, constitutionally a monarchy and politically bourgeois. The revolutionary climax seemed at hand in September 1920, when, under Socialist leadership, workers occupied the largest industrial factories. There was no resistance, and the bourgeois state seemed to be collapsing. As the barricades were being manned, the Socialist leaders suddenly discovered that there was no Lenin or Trotsky among them and that they had retained bourgeois ideas under their revolutionary appearance. The call to the barricades was off, the factories were surrendered, and the revolution was postponed indefinitely.

This was the essence of the crisis which weakened postwar Italian socialism: an official revolutionary attitude coupled with an innate incapacity for revolution. In 1919, and again in 1921, the Socialists, as the largest political group, could have formed a Cabinet, but they took the position that they could never participate in any government. This position, logical if we consider the revolutionary premises of the party, became political suicide for a party incapable of revolution and led to a serious weakening of parliamentary government.

The changed political outlook was accompanied by a change in the electoral machinery, from a single constituency system to proportional representation applied within fairly large constituencies. The chief consequence of this development was the strengthening of organized political party life—a good thing in itself, provided normal relationships could be established among the parties. As it was, the Socialists cut themselves off as a result of their rigid and preconceived position, the Christian Democrats were viewed with suspicion by the liberal and democratic groups imbued with the old lay tradition, while these groups were themselves incapable of providing strong government and of renovating their outworn political leadership.

Administrative System.—The general pattern consistently followed by Italy since her unification has been one of centralization based largely on the Napoleonic system. As Piedmont gradually extended its control over the whole country, it imposed a uniform system of administration which failed to take into account the regional differences of the past. The country was ruled from the center and divided into provinces, each headed by a prefect appointed by the central government. There is nothing wrong with a centralized administrative system in so small a

country as Italy, provided certain limitations are recognized beyond which the power of the central government generally does not extend. In Italy these limitations were not recognized, and the development of democratic institutions at the periphery was thwarted. Nevertheless, Italian bureaucracy, though all-embracing and rigid and not very up to date in its methods, developed into a good administrative machine with high standards of honesty and devotion to the ideals of public service. Only fascism succeeded in corrupting it. Similar limitations hampered the judiciary, which had to move within the stiff framework provided by a system of codified law, with no room for imagination and feeling for social change on the part of the judges.

Local governments were independent in name. Each province had an elective provincial council with limited jurisdiction. Each commune, or town, was governed by an elective municipal council. But over them all hovered the omnipotent figure of the prefect. Stifled and controlled at every turn, local administrators could hardly be expected to develop independent plans and the proud spirit which has made of the institution of local self-government a pillar of strength of democratic traditions in Anglo-Saxon countries. But the power of control was not the only one which the central government could exercise through the prefects. It could, and repeatedly did, dissolve popularly elected municipal councils and replace elected mayors with central government commissioners. Such drastic moves had to be justified by a substantial degree of administrative malfeasance on the part of the local bodies. While malfeasance existed in some instances, it was invented in others, when the primary purpose was the removal of recalcitrant local political leaders whose activities were deemed a nuisance to the political groups in power in Rome. It is important to establish as a historical fact that even before 1922 the weakening of local democratic institutions had begun as the result of a belief in the superiority of a centralized administrative system.

Political Freedoms.—Notwithstanding these shortcomings, the historical balance must weigh heavily in favor of the conclusion that, in the period under consideration, personal and political liberties were greatly strengthened. The citizen remained secure in his fundamental rights, even though suffering at times from an excess of police zeal in the maintenance of law and order; and voting could be freely exercised by all except in some areas of southern Italy where ignorance and political pressure combined to produce unsatisfactory results. Above all, that fundamental and first of political freedoms, freedom of the press, was in full bloom and vivified political life with its presence.

It has become increasingly difficult to define the conditions which are required for the existence of a free press. For our purposes, it is perhaps enough to say that freedom of the press exists in any country which has a certain minimum number of independent newspapers. An independent newspaper is one whose policies are established by a board of editors which is free of ties with any political party, group, or particular economic interest, and is entirely devoted to the promotion of the public welfare. Such a newspaper must have achieved, because of its independent criticism of policies and of views, because of its full and objective coverage of news as dis-

tinguished from opinion, because of the good quality of its writing, a wide circulation and must be available to all throughout the country. A country which is blessed by two or three newspapers of this type has come as near to the ideal of freedom of the press as it is human to expect. Italy, together with a very few other countries, found herself in this condition during the first quarter of the 20th century. An informed public opinion, educated by a strong press, was one of the greatest obstacles fascism had to surmount before it could achieve its dictatorial goal. This was attainable only after the use of violence, legal or otherwise, had allowed fascism to gain complete physical control of the Italian press.

Economic Policies.—This period was one of great economic development. Old industries, such as the manufacture of textiles, expanded, while new industries, such as iron, steel, and engineering, were created. Not all of this growth was achieved without government intervention and protection, including the use of subsidies and protective tariffs. Such aid brought about the rise to influence of a group of industrialists who could not justify their existence except as representatives of the state, and the development of labor groups which considered it logical to thrive on government privileges. This artificial economic structure helped to aggravate the 1919 crisis and led some industrial leaders to consider the state as their own preserve, which they could use for the satisfaction of their private interests.

THE FASCIST CRISIS

Many reasons have been given to explain the development of a strong Fascist movement in Italy after the autumn of 1920, and the seizure of power by that movement on Oct. 28, 1922. The least valid of the explanations seems to be the purely Marxist one, which sees everything in terms of a struggle between a declining but aggressive capitalist system and the proletariat, with the triumphant capitalists establishing a dictatorship to keep the working class under their control. The reality is far more complex. Sentimental and entirely uneconomic nationalistic feelings played a major role. Traditions which made the maintenance of law and order appear desirable as a matter of principle have also to be taken into account. From our point of view, however, it is sufficient to point out the failure of the political system, and specifically of Parliament, to function in times of crisis. Any inquiry into historical might-have-beens is usually unrewarding. The fact is that among the elder statesmen who in 1922 held the balance of power there was a widespread sentiment of resignation and of self-admitted failure. Under the circumstances, they reasoned, the only way out of the political crisis was to let the new Fascist movement assume the responsibility of government and show what it could do. The twin hope was never abandoned that, on the one hand, once in power fascism would become a normal and constitutional political movement and that, on the other, it would gradually decline and allow the older political groups to return to office. Both hopes were inevitably destined to be disappointed, and fascism developed as a ruthless totalitarian dictatorship, unconstitutional by definition, which completely abolished all non-Fascist political leadership.

Fascism and Government.—The apex of the Fascist system was the dictator, who enjoyed all

the extraordinary legal powers granted to him by special laws and the even wider sphere of illegal and personal powers possessed by the leader in any dictatorial system. Benito Mussolini's power remained quite strong almost to the end. His influence reached down into the administrative sphere, and no policies could be adopted without his sanction. His influence was also used to symbolize the new Italy fascism was said to be developing and to create that leader-and-follower complex which is the essence of such a system. To him was attributed an all-encompassing wisdom and knowledge, and an attempt was made to train the people to accept all his decisions as indisputably right.

Next to the dictator was the *Gran Consiglio del Fascismo* (Fascist Grand Council), which was made an organ of the state in 1928. It was the highest assembly in which the top leadership of the Fascist Party could act as a corporate body. What the actual accomplishments of this agency were, in terms of establishing general policy directives is difficult to say in the absence of any exhaustive published record of its activities. Great mystery surrounded its meetings, which were usually held late at night. It is likely, however, that within it the various currents of fascism found expression and tried to gain ascendancy by influencing Mussolini. This was a fruitless process, since he was easily accessible to successive and contradictory views. By 1943, fierce conflicts had arisen within the council, with a large group revolting against the leadership of the dictator.

Next in order, but actually at the bottom of the scale in point of influence, came Parliament in the various stages of its transformation under fascism. As a result of the elections of 1924, a Fascist-dominated Chamber of Deputies came into existence, bearing, however, some outward resemblance to the chambers of the past, owing to the existence of an effective opposition, whose chief leader was the United Socialist deputy Giacomo Matteotti. Matteotti's murder on June 10, 1924, marks the beginning of a complete totalitarian regime. The Chamber of 1929 was the first elected by plebiscite (from an official slate by a sharply reduced electorate), and was composed solely of Fascists. The Chamber of 1935 represented the first fruit of the corporative phase of fascism, for all its members were representatives of organized economic groups. In 1938, the Chamber of Deputies was abolished and replaced by the Chamber of Fasces and Corporations.

Throughout these vicissitudes the organization of the Senate remained unchanged. Its members continued to be appointed by the king, though of course from among deserving Fascists recommended by the government. To the end, however, a small group of pre-Fascist senators continued to exercise their functions. In the last decade of fascism, they remained silent of necessity, but a few black balls continued to mar the principle of unanimity deemed so important by the official doctrine. As parliamentary bodies, both Chamber and Senate were reduced to the task of recording decisions taken by the higher party hierarchy.

Fascism and Administration.—In its attitude toward the civil service, fascism followed a policy of expediency, compounded of cynicism and the realization that it needed the daily support of hundreds of thousands of public employees working at routine tasks. A few were discharged.

The majority seized upon the first suitable occasion to join the Fascist Party. Among the higher ranks of civil servants, judges, and university professors, those who refused to join the party were more numerous. In 1931, all civil servants were required to take an oath of allegiance to the regime, which most of them did take after Benedetto Croce pointed out the invalidity of such an oath. Those who refused to take the oath were dismissed, but party membership was not made compulsory on civil servants who had acquired permanent tenure. Naturally, promotions and transfers to more desirable jobs and locations were out of the question for nonmembers. As the years of Fascist rule wore on, a new generation of younger and Fascist appointees occupied a majority of the administrative posts, while at the same time the functions of government were greatly expanded. As a whole, the competence and the high regard for the public weal which had obtained in the past were seriously weakened.

In the field of local administration, fascism developed logically its premise that authority flows from above, and that elections of all kinds should be abolished, by eliminating all traces of self-government and replacing local elective mayors with centrally appointed officials.

Fascism and Political Freedom.—The basic element of political freedom, the possibility for the citizen to choose between different courses of action, disappeared. A monopoly of political power was in the hands of the Fascist Party. Within this framework, all other freedoms disappeared. Freedom of association was suppressed. All groups had to receive the government's stamp of approval. Freedom of assembly and freedom of speech were similarly limited. Freedom of the press continued to exist only within the framework of the interests of the ruling ideology. The courageous resistance of the great majority of non-Fascist papers was finally overcome in 1925. In that year, a law was passed which required each newspaper to accept a government-appointed director. Thereafter, only Fascist papers existed, distinguished among themselves only by the degree of virulence in their vocabulary and by the degree of proximity to the treasury of the Fascist Party (some of them had to be financed outright by the party, while others bearing old and famous names continued to be financially self-supporting). Their make-up, headlines, and general distribution of contents were regulated by a central propaganda office in Rome. There was no old-fashioned censorship: no modern dictator could stand the sight of newspapers appearing with large blank spaces on the front page. By far the most effective method was that of decreeing every day what the papers should print.

Fascism and Economic Life.—Having destroyed civil liberties, fascism could not maintain freedom in the economic sphere. The system of regulation which began in 1926 with the establishment of syndicates, as the monopolistic Fascist trade unions were called, was extended gradually to all spheres of economic life. The Fascist economic controls sprang both from a desire for regulating people's lives and from the logic of a political system which very soon made war its final goal. When, during the depression of the early 1930's, fascism gained control of a sizable portion of the industry and the banking structure of Italy, the element of chance was still very

great. After 1935, however, the extension of government controls became a deliberate policy. These were the years when the corporative system was put into effect and was hailed by Fascist apologists as an epoch-making discovery, giving economic life its due in a world accustomed for too long to recognize the primacy of political values. But the corporative system was nothing but a screen hiding the much simpler reality of mobilization for aggressive war.

Fascism and the People.—There were three major phases in the relation of the Italian people to fascism. The first was the long and generally unrecognized period of resistance which extended from 1920 to 1926. This was a time of warfare in which substantial numbers of people actively participated. The costly fight was unavailing. The second phase lasted from 1926 to 1936. It was a period of resignation and of open allegiance on the part of many who were satisfied by the limited economic improvement which then took place. This was a time when opposition to fascism seemed the attitude of Utopian dreamers who failed to notice the worldwide chorus of approval for the system. The third phase extended from 1936 to 1943. The Ethiopian War (1935-1936) brought home to many the realization of what fascism meant. Extensive underground activities began, and free Italy matched the Fascist intervention in Spain in support of Gen. Francisco Franco with an anti-Fascist intervention of thousands of courageous fighters in defense of democratic institutions. The name of Carlo Rosselli, publisher of an anti-Fascist Italian weekly in France, should be remembered at this point. It was because he symbolized the new Italy which was being born that Mussolini had him murdered in France in 1937 together with his brother Nello. With the beginning of World War II, anti-Fascist activities became more intense and new and old party lines began to be drawn. In the spring of 1943, strikes and other openly rebellious movements took place, and, under the joint impact of British and American invasion and popular revolt, fascism quickly disintegrated. It was obvious that it had long since ceased to command the allegiance of the great majority of the Italian people, who were slowly and confusedly groping their way toward some new kind of political organization. This is not to say that 21 years of Fascist rule could go by without leaving profound consequences. The old cynicism of a very old people had increased. The lack of morality in public life which had characterized fascism was not entirely remedied, and new generations wholly innocent of democratic processes still found it easier to accept slogans and goals which were only thinly separated from Fascist ideology. The recovery of the mind was going to be a slower process than the recovery of the body. (See also FASCISM.)

THE TRANSITIONAL PERIOD: 1943-1946

With the Allied invasion of Italy, beginning in July 1943, Allied Military Government (AMG) was imposed on the areas freed from German occupation. The existence of AMG did not mean that the Italian state had ceased to exist. A government recognized by the Allied powers was at all times in existence after the downfall of the Fascist regime on July 25, 1943. There was thus no break in the continuity of the Italian state such as occurred in the case of Germany. In practice, the functions of the Italian government

were suspended for a time and then gradually restored as the military front advanced toward the north. By the end of 1945 the Italian government had reacquired substantial jurisdiction over the entire national territory with the exception of the colonies and certain border areas. To a far greater degree than in any other former enemy territory, the functions of AMG were limited to zones of immediate military significance and to a generic and limited task of control of the activities of the committees of national liberation and of the Italian government itself. This limited control points up the fact that in Italy far more than Germany the hold of the Fascist dictatorship was a superficial one, and one quickly eliminated by the unfolding of historical events.

The Forty-five Days.—From July 25 to Sept. 8, 1943, Italy underwent a strange experience. Seeking peace, yet still appearing to fight on the side of Germany, the country got rid of its Fascist government and made a hopeful beginning toward the reassertion of democratic liberties. In this period, Germany refrained from open intervention and occupation of the territory of its ally. Political parties emerged from hiding, and a free press, subject only to normal military censorship, began to appear. In these weeks government was headed by Marshal Pietro Badoglio, whose authority extended throughout the peninsula. The machinery of the state seemed intact, and many Italians hoped that the change from war to peace could be achieved without destructive consequences.

Occupation and Liberation.—The scene changed overnight after the announcement, on September 8, of the armistice concluded with the Allies. Acting swiftly, Germany occupied all of northern and central Italy. (After the fall of Naples, on October 1, the battleline was stabilized north of that city.) The Allied inability to make landings to the north meant the beginning of a long military struggle which ended only in April 1945. As an effective administrative machinery the Italian government disappeared in northern Italy, where a rump Fascist republic was organized under German control in September 1943. Until the occupation of Rome (June 4, 1944), the Badoglio government continued in office. This was the period when the government of Italy was effectively in the hands of AMG. After the liberation of Rome, the first political government was formed under Ivanoe Bonomi, on June 9. Finally, with the liberation of the north, a new government, deemed representative of the new Italian political forces, was formed under the underground leader Ferruccio Parri, on June 17, 1945. The old Italy was fading away, and new political figures were asserting themselves. The Parri government lasted until Nov. 24, 1945. Shortly thereafter, on December 10, the first Alcide De Gasperi government was formed on the assumption that political responsibility should belong primarily to the largest organized political party, the Christian Democrats.

The Republic.—Throughout this period the monarchy survived, if not unchallenged, at least undisturbed. A violent debate raged among the advocates of immediate elimination of the monarchy, of abdication of the king, and of the status quo. It was finally decided to submit the issue to a popular referendum to be held on June 2, 1946, together with elections for a con-

stituent assembly. Shortly before the date fixed for the referendum, on May 9, Victor Emmanuel III abdicated in favor of his son, who ascended the throne as Humbert II. This move was interpreted as an attempt to improve the chances of the monarchy by eliminating from the debate the person judged by most to bear a heavy responsibility for fascism.

The results of the referendum went against the monarchy by a fairly small margin (12,717,932 to 10,719,284), with the north voting overwhelmingly in favor of the republic and the south overwhelmingly in favor of the monarchy. The new king accepted the results of the referendum after some hesitation and left with his family for Portugal on June 13. With the proclamation of the Italian Republic on June 10, the 9-century rule of the house of Savoy came to an end.

THE POSTWAR POLITICAL LANDSCAPE

The accompanying table compares the results of the last Italian elections before fascism and of the two general elections of 1946 and 1948. The figures show that the Right and Liberal Center suffered major defeats in the 1946 and 1948 elections, with many of their followers voting in 1948 for the Christian Democratic Party because of its strong anti-Communist position. The Christian Democrats gained ground steadily since 1921, with a remarkable upswing in the 1948 elections. Their parliamentary majority after 1948 had no precedent in the history of Italy since 1876. The percentage strength of the Marxist parties remained substantially the same in 1946 and 1948. Since 1921, however, the Communists gained much more than the Socialists. In the elections of 1948 the Christian Democrats improved their position throughout the country, while the Communists, defeated in their strongholds in the industrial north, made up for the loss by gaining among the peasants of the south.

From the point of view of ideology, the Christian Democratic Party, which bore the main burden of governmental responsibilities following the 1948 elections, occupied a difficult middle position between the old individualistic approach

to the methods to be followed and to the choice to be made between different solutions stood out in contrast to the simplified centralizing solutions of the Marxist parties. With regard to the equally important question of limits to state intervention, the Christian Democrats proposed that private activities should have full room for development and that state intervention should not extend to more than a part of the economic activity of the country.

To the Communists, questions of limits, procedures, and alternatives had a more limited appeal, since they did not occupy a middle position on the political stage, but wholeheartedly favored a given type of political and economic solution based theoretically on Marxism, but practically on the interpretation which Soviet Russia has given of Marxism. As such, they were the bearers of a specific set of economic and political solutions which they claimed to be the true solutions from which no deviation was possible. They had before them the concrete example of the Soviet Union and did not intend to deviate in any substantial respect from the general structure established there. The compromises which the Italian Communists appeared in 1948 to be willing to accept, such as the right of the individual peasant to own his own land, did not have a persuasive quality and were not believed to have any chance of survival in an economy as fully collectivized as that envisaged by the Communists. Their view of government appeared to be one in which there would be no room for the peaceful rotation in office of different political parties. It is true that in 1945 a leading Italian Communist said that he saw the possibility of normal competition between two fundamental political currents, the bourgeois or conservative one on the one hand, and the popular or progressive one on the other. But more and more thereafter the Communist tendency was to identify as democratic forces only those whose political activities could be tolerated from the Communist point of view or, at any rate, not to consider any government democratic in which the Communists did not participate.

ELECTIONS TO THE ITALIAN CHAMBER OF DEPUTIES
VOTES AND SEATS: 1921, 1946, AND 1948
(Votes in thousands)

Parties	1921			1946 ¹			1948 ²		
	Votes	Per cent of total	Seats	Votes	Per cent of total	Seats	Votes	Per cent of total	Seats

¹ Constituent Assembly.

² Figures rearranged to make them comparable with previous returns.

to economic and political problems and the new collectivistic concepts. If, on the one hand, it was anxious to maintain the value and the function of the individual citizen in a political sense and to build a constitutional system in which individual freedoms would be strongly guaranteed, on the other, it stressed the need for collective intervention and planning in the economic sphere. Here, again, however, the importance attached

After World War II, the Socialists in the main tended to go along with the general attitudes and policies of the Communists, and it soon became clear that the party leadership aimed at an eventual fusion of the two parties. To the old-line Socialists, brought up in the humanitarian and free traditions of the British Labour Party, the possibility of adhering entirely to Communist theories and practices did not look at-

tractive. When all efforts failed to maintain the Socialists as an autonomous party, the anti-Communist Socialists split from the main body of the party in January 1947, and two Socialist parties resulted. Thereafter, the larger of the two pursued a policy of close alliance with the Communists over what appeared by 1949 increasing internal opposition. The other tried to maintain itself as an independent workers' movement inspired by Marxism but modeling its political activities on the pattern established by the Socialist parties of western Europe. In the elections of 1948 this group won over to its side the allegiance of some middle-class groups which had hitherto been frightened by the Communist leanings of socialism.

THE CONSTITUTION OF 1948

The Italian Constitution is the result of a year-and-a-half's work by the Constituent Assembly elected in June 1946. The final text, approved by the assembly in December 1947, and put into effect on Jan. 1, 1948, without need for popular referendum, reflects on the whole, and to a greater extent than had the original draft, the numerical superiority of the Christian Democrats over the Marxist parties. It retains, in less ambiguous terms and with greater attention to the demands of common sense, the major solutions which had asserted themselves since the opening of the debate:

(1) A bill of rights which, in its political aspects, is inspired essentially by the individualistic tradition of human rights.

(2) A bill of economic rights and duties incorporating the contemporary version of the duties of the community and of the state toward the individual, and of the duties of the individual toward the state, such as his duty to work. There is no specific mandate to nationalize basic industries.

(3) A central administrative system which has yielded some of its powers in favor of regionalism. Nevertheless, sufficient power is vested in the central government to make the reality or ultimate success of the regional experiment a matter of doubt.

(4) A parliamentary system of government in which a balance of power between the executive and legislative branches is envisaged. Two equally powerful legislative bodies, a Chamber of Deputies and a Senate, are provided for.

(5) A Constitutional Court. For the first time in Italian history, an attempt has been made to imitate the American tradition of a court with power to declare laws unconstitutional.

The Bill of Rights.—The constitution vests sovereignty in the people and declares Italy to be a democratic republic based on labor. The initial attempt to declare that political rights are dependent upon the fulfillment of some activity or function contributing to the material or spiritual development of society was abandoned, as were several other Communist-inspired imitations of phraseology borrowed from the Eastern European "people's democracies." With certain limitations, all fundamental personal and political freedoms are recognized. Two of these limitations deserve mention. First, all secret associations are forbidden, as are groups which pursue political aims through military means. The revival of Fascist societies is prohibited. Second, in guaranteeing freedom of the press and of other means of communication of thought, the constitution de-

clares that violation of press laws may justify government seizure in cases of extreme urgency and in cases where judicial intervention cannot be obtained in time to prevent publication of the offending material. Judicial support must, however, be procured within 48 hours in order to validate such action.

Trade unions must be organized democratically and must obtain recognition by the state. Thereafter, unions may negotiate collective contracts binding upon all workers affected by the contract, whether they are union members or not. The right to strike may be exercised only within the limits of the laws regulating it.

Both private and public property are recognized. The former is guaranteed by law, although limits may be set to its accumulation and use in order to make it accessible to all and to establish equitable social relationships. For the sake of the general welfare, the state may transfer to itself or to workers' or consumers' cooperatives enterprises in the fields of public service and power, and monopolies. By recognizing the general principle that certain fields of economic activity may come under state supervision, while private property and the right of private economic initiative survive, the constitution makes possible an experimental approach to the problems of the future.

Church and State.—The problem of the relationship of the Italian state to the Roman Catholic Church had finally been settled by the Lateran Treaty and the Concordat of 1929. The Lateran Treaty resolved the question of the pope's temporal possessions in Italy. On the one hand, papal sovereignty over the state of Vatican City was recognized; on the other, the pope gave belated official acknowledgment of the unity of the Italian people by recognizing the Kingdom of Italy as then constituted. In the concordat, the wholly different matter of the relationship between church and state in Italy was settled. Roman Catholicism was recognized as the state religion, and the right of the Italian government to approve the appointment of bishops was admitted, while the requirements of religious teachings and the legal validity of religious marriage were recognized.

After the end of fascism, no responsible voice was raised to maintain that the Lateran Treaty should be abrogated. The territorial and political settlement contained in that treaty still appeared the best solution of a difficult problem. But the concordat was viewed in a different light. Disregarding the privileges which had been granted to the Italian government, which permitted it to control to a large extent the life of the church in Italy, the critics of the concordat objected to the provisions which gave the Roman Catholic religion a position which formally could not be equaled by other religious confessions. The proposals advanced varied from outright repeal to substantial modifications, particularly in the direction of ending the recognition of Roman Catholicism as the state religion. Against these proposals the Christian Democratic Party waged a successful fight. Article 7 of the constitution, voted with full Communist support, reads: "The state and Catholic Church are, within their respective spheres, independent and sovereign. Their relationships are regulated by the Lateran treaties." This makes the Concordat of 1929 a part of the constitution. The unbalance created by this inclusion, deprecated by some as unwise, is re-

dressed, however, by a further provision passed by all other parties over Christian Democratic opposition, which makes future negotiated changes possible without the need for amending the constitution, as well as by Article 8, which declares all religious faiths equally free before the law and recognizes their right to organize themselves freely.

Regionalism.—The attempt made, principally by the Christian Democrats, to decentralize the traditionally highly centralized administration of Italy was a reaction against the Fascist regime's intensification of controls from the center, as well as an endeavor to embody in the constitution the Christian Democratic belief that the region is a natural body which cannot be suppressed. The constitution represents a compromise between the Christian Democratic position and the Communists' insistence that a strong central government would be necessary for postwar economic reconstruction.

The two main traditional units of local government had been the commune (municipality) and the province, the latter being the chief subdivision through which the central government exercised its control over local affairs. Under the Constitution of 1948, an entirely new entity—the region—was created. The boundaries of the regions generally follow the historical boundaries which separated the various states before the unification of Italy. Nineteen autonomous regions are recognized, while special privileged positions are given to the islands of Sicily and Sardinia and to the three frontier regions of Friuli-Venezia Giulia (bordering on Yugoslavia), Trentino-Alto Adige (bordering on Austria), and Valle d'Aosta (bordering on France and Switzerland).

The constitution embodies the following principles:

(1) Each region is governed by a popularly elected regional council, which in turn chooses the regional executive, the president.

(2) Subject to the general principles established by national laws, and provided the national interest and the interests of other regions are safeguarded, the region may issue legislative norms in the fields of local administration and police, local markets and public works, public welfare and health, professional schools, local transportation, agriculture, forestry, and town planning.

(3) In order to carry out its functions, each region is to have financial autonomy within the limits established by national laws. Regions may acquire funds either through their own taxation or through receipt of parts of the revenue of the central government.

(4) The central government maintains powers of control over the regions in several significant ways:

(a) Regional councils can be dissolved for acts contrary to national unity, serious violation of national laws, failure to remove the regional president after the central government has asked for his removal for similar acts, reasons of national safety, or inability of a council to function. This power of dissolution is exercised by the president of the republic after he has heard a joint parliamentary committee on regional questions. The control thus given to the central government is sufficient to indicate that regions are far from autonomous.

(b) The government maintains continuous control over the legislative enactments of the

regions. Laws approved by a regional council must be transmitted to a representative of the national government resident in the regional capital. The government can return them to the council because they exceed regional jurisdiction or conflict with the interests of the nation or of other regions, or can challenge their constitutionality.

(c) Each region is to have a constitution or statute of its own. First approved by the regional council, the statute must also be embodied in a law of the republic. Presumably, it would not be approved if it contained anything considered to conflict with the national constitution.

In summary, it may be said that useful tasks of a local nature are given to the regions, and opportunity is afforded for training in citizenship, administration, and independent thinking. This is a positive gain over the old system. Nevertheless, this attempt to combine strong central administration with quasi federalism leaves a sufficient preponderance of power in the national government to indicate that regions are not to play as significant a role as the Christian Democrats had hoped.

Legislative Power.—Defeating all Communist proposals in favor of a single legislative assembly, the Constituent Assembly organized the legislative system as follows:

(1) Legislative powers are divided equally between a Chamber of Deputies and a Senate. Each has jurisdiction and powers equal to the other. The two chambers are brought together as a National Assembly in cases prescribed by the constitution.

(2) The Chamber of Deputies is elected for a term of five years by universal suffrage. The system of election, not provided for in the constitution, is that of proportional representation with preferential voting. The number of deputies is 574.

(3) The Senate is elected on a regional basis with each region except Valle d'Aosta sending at least six senators. There is one senator for every 200,000 inhabitants. Senators hold office for six years and are elected under a hybrid system combining features of both majority and proportional representation. Total normal elective membership of the Senate is 237. In addition, but for the period 1948–1954 only, there are a number of senators of right. (In 1948, there were in all 344 senators.)

(4) Since the two chambers have equal legislative powers, unresolved conflicts would presumably lead to dissolution by the president of one or both of the chambers. The constitution itself is silent on this point.

(5) The limited use of popular referendum and initiative is admitted.

The President of the Republic and the Cabinet.—Both the initial draft and the final text show a strong effort to create a relationship between executive and legislature similar to the British one. The final text, overcoming Communist-Socialist opposition, provides for greater executive powers than even the draft had allowed.

The president of the republic is elected for seven years by the two chambers meeting in joint session, and by three representatives from each regional council except that of Valle d'Aosta, which sends one representative. His foremost power is that of dissolution of the chambers at any time except during his last six months in office. He can send back to the chambers, within

the time limit allowed for promulgation, and with a message stating his reason for such action, any bill of which he disapproves. Presidential promulgation must follow if the bill is again approved by the chambers. He can also send general messages to the chambers, and he must authorize the presentation of government bills. In addition to the powers already mentioned, the president, as chief of state and symbol of national unity, receives and accredits diplomatic representatives, ratifies treaties, commands the armed forces, and declares war upon decision of Parliament.

The prime minister and, upon his advice, the members of the Cabinet are appointed by the president. The Cabinet as a whole must seek the confidence of Parliament within 10 days of its appointment and must continue to enjoy that confidence if it is to remain in office. A vote of nonconfidence by one house is sufficient to overthrow a Cabinet, but three days must elapse before a vote on a motion of nonconfidence may be taken.

The prime minister is responsible for the direction of the general policies of the government and for the maintenance of unified political and administrative action among the ministries. Executive decree laws are legitimized, though only in extraordinary cases of necessity and urgency, and under rigid conditions.

The Constitutional Court.—The strongest pressure in favor of a Constitutional Court came from the Christian Democrats.

The court is composed of 15 justices nominated for terms of 12 years, one third by the president, one third by Parliament, and one third by the highest ordinary and administrative courts. It has jurisdiction over the constitutionality of both national and regional laws, conflicts between regions and the national government, and the impeachment of the president and Cabinet members. The question of constitutionality may be raised by the bench or by either party to a judicial action. Decisions of the court are final, and laws declared unconstitutional cease to have effect one day after publication of the court's decision. There is no time limit on the testing of a law's constitutionality.

MARIO EINAUDI,

Professor of Government, Cornell University.

NOTE: The foregoing 10 articles on Italy were prepared under the joint direction of the editor of the *Encyclopedia Americana* and Dr. Mario Einaudi, professor of government at Cornell University.

ITALY, Free Church in, the Evangelical Italian Church, a reformed religious sect founded in 1870 by Alessandro Gavazzi (q.v.). In 1874, a confession of faith was formulated, an ecclesiastical constitution framed under a general assembly, and the title "Free Church in Italy" assumed. The confession resembles that of other Protestant churches, and the constitution is based on a government by elders, like that of the Presbyterians, although the several congregations are practically uncentralized. In 1891, by royal decree, the title "Chiesa Evan-

gelica Italiana" was given to this body. Elementary and Sunday schools are maintained. The schools of the church in Florence are partially supported by the state, and a gift bought and presented by British friends is the old church of San Jacopo, Florence.

ITASCA, i-täs'kà, **Lake**, farthest source of the Mississippi, in Clearwater County, northwestern Minnesota. It is located at about 47°13'10"N., and 95°12'W., at an altitude of 1,457 feet above sea level. It was first definitely proved to be the source of the Mississippi by Henry Rowe Schoolcraft (q.v.) in 1832, as a result of a journey of exploration undertaken under the auspices of the United States government. At the same time it received its name by a fanciful combination of the last four letters of the Latin word *veritas* (truth) and the first syllable of *caput* (head). The ground has a substratum of sand and gravel, mingled with large boulders, and the surface is swampy. The basin has been made into a state park of 30.78 square miles. In the center, fed by springs so permanent and with a flood plain so small that it has actually risen in dry seasons, is the lake, which has an area of only 1¼ square miles. It consists of a center running east and west for about a mile, with two arms in the south, each about 1½ miles long, and another in the north about 1 mile long. The shoreline extends more than 13 miles; the average depth is 20 to 35 feet. The Mississippi flows from the north arm. See also MISSISSIPPI RIVER. Consult Clarke, H., *The Source of the Mississippi* (New York 1886); Winchell, N. H., "The Source of the Mississippi," *Collections, Minnesota Historical Society*, vol. 8, p. 226 (St. Paul 1898); Brower, J. V., *Itasca State Park* (St. Paul 1904).

ITATA CASE, 1891, the cause of differences between Chile and the United States, resulting from the revolt against President José Manuel Balmaceda (q.v.) by the Congressional Party. The latter through an agent had bought a quantity of arms and ammunition in New York, which were shipped to San Francisco and then sent by schooner down the coast, where the cargo was transferred to the insurgents' vessel, the *Itata*. The attorney general issued a writ of detention on the ground that the *Itata* was violating United States neutrality laws. The ship set sail, however, and the U.S.S. *Charleston* was sent in pursuit, overhauled and captured her, and placed her on trial in the United States district court in San Diego. The court discharged the vessel as not having been guilty of violation, but its detention angered the Congressionalists, who had meanwhile been successful in overthrowing Balmaceda. Consult Godkin, E. L., "Itata Case," *The Nation*, 52: 416 (1891).

ITCH, a contagious eruption of the skin caused by its invasion by the itch mite (q.v.). See also SCABIES.

ITCH MITE (*Sarcoptes scabiei*), a parasitic mite which enters the skin and multiplies, causing itch or scabies. The female itch mite, which is longer than the male, is about one fifth of an inch in length and is visible to the naked eye. In order to penetrate the horny layer of the epidermis, the mite assumes a nearly perpendicular position; and to avoid as much

trouble as possible, it usually selects such spots as give least resistance, such as the space between the fingers, the inside of the wrists, or the groin. Once fairly buried it does not again come out but burrows, and forms tortuous galleries within the skin. These galleries resemble the mark which is formed when a pen is drawn lightly over the skin without causing a scratch. At certain intervals the galleries are pierced by small openings for the admission of air. The vesicles characteristic of the itch disease are attributed to a poison ejected by the mite.

For treatment soften the affected area by massaging it with green soap and warm water, then apply a sulphur ointment. All clothing that has come in contact with the infection should be boiled.

ITHACA, city, New York, and seat of Tompkins County, at an altitude of 389 feet, situated at the southern end of Cayuga Lake, 29 miles northeast of Elmira, and served by the Lehigh Valley and the Delaware, Lackawanna and Western railroads and state highways. Its industrial products include power drive chains, adding machines, shotguns, salt, cement, ladies' underwear, electric clocks, fertilizers, clay products, leather goods, paper, technical apparatus, and shirts. Through Cayuga Lake, the city has shipping access to the New York State Barge Canal System, and it also has a municipal airport, one mile outside the city, with a scheduled airline service.

One of the major educational centers in the state of New York, Ithaca is the seat of Cornell University (q.v.), the state colleges of Veterinary Medicine (founded 1894), Agriculture (founded 1904) and Home Economics (founded 1925), all located on the Cornell University campus, and Ithaca College, founded in 1892, with over 1,300 students (1951). The city's library has some 48,000 volumes, the Cornell University library more than 1,500,000 volumes. The historical society maintains a museum, and there are several special museums at Cornell.

The city has three general hospitals and one state hospital. There are three state parks nearby and Stewart Park, at the head of the lake, is the city's principal place of outdoor recreation. It has as notable and distinctive features the Renwick Bird Sanctuary and the Fuertes Wildfowl Sanctuary. These refuges are maintained by the city in cooperation with the ornithology department of the university. There is a memorial gateway with a tablet commemorating Louis Agassiz Fuertes, who was born at Ithaca and painted many of his famous bird pictures there.

First settled in 1788, Ithaca was named by Simeon De Witt, surveyor general of New York State, in 1806, following a military survey of central New York. It was during that time, the first decade of the 19th century, that many towns received names of ancient Greek and Roman origin. It was incorporated as a city in 1888 and the government is by a mayor and council of 14. Pop. 28,799.

ITHACA, ìth'á-ká (Gr. Ἰθάκη, ê-thä'kyê), one of the Ionian Islands, Greece, and the smallest except Paxos, 17 miles northwest of the mainland of Greece and two miles northeast of Cephalonia, with which it forms Cephalonia Department. The surface is divided into two mountainous masses, with a narrow isthmus between, but there

are many pleasant valleys. The chief products are wine, currants, and olive oil. The island has an area of 36 square miles and was celebrated among the ancients as the home of Odysseus (Ulysses). Vathy (or Ithaca) is the capital. Pop. (1951) 7,083.

ITINERANCY, î-tin'ér-àn-sî, a passing from place to place. In ecclesiastical usage, the Methodist system of limited pastorates instituted by John Wesley. In the American Methodist Episcopal Church no time limit has been placed on pastorates since 1900, although the bishop appoints preachers from year to year. See also **METHODISM**.

ITINERARY or **ITINERARIUM**, the schedule of a route or table of the stages between two places of importance with the distances from one to another. Much of our knowledge of ancient geography is due to the itineraries issued by ancient peoples. Of these the best known are *Itinerarium Antonini*, a sketch of the stations and distances along various Roman roads; *Itinerarium maritimum*, giving the distances from Corinth to Sicily and Carthage, made during the reign of Antoninus Pius; and *Itinerarium Hierosolymitanum*, made by a Christian pilgrim in 333 A.D. The first mentioned itinerary contains the *Itinerarium Proviniarum Anto(ni)ni Augusti*, further accounts of distances and stations in the Roman provinces.

ITIUS PORTUS, the port on the French coast, nearly opposite Dover, from which Julius Caesar sailed on his second expedition to Britain in 54 B.C. Its position has been a matter of much controversy, but the majority of geographers identify it with Wissant, a village nine miles west-southwest of Calais.

ITO, ê-tô, **MARQUIS Hirobumi**, Japanese statesman; b. Choshu, Sept. 2, 1841; d. Harbin, Manchuria, Oct. 26, 1909. His father was a samurai retainer of the daimio of Choshu, with whom the youth became a trusted agent in his opposition to the shogunate. While at Yedo in the interests of his chief, Ito became acquainted with western methods of warfare, consequent on the visit of Commodore Matthew C. Perry in 1854, and determining to study these in their native countries, with four comrades, including Kaoru Inouye, left Japan secretly, and eventually arrived in London. Diplomatic complications arising, owing to his daimio ignoring the right conferred by the shogun on European powers to navigate the Inland Sea, Ito hastened home before two years had elapsed, but was unsuccessful in his efforts to persuade the daimio of Choshu from opposing the European fleets assembled at Shimoda. The daimio defeated, Japan awakened to the power of the West, and Ito became the impelling factor in its reorganization on models more in accord with the leading powers of the world. He took an active part in the overthrow of the shogunate and the restoration of the imperial power in the person of the emperor or mikado; in 1868 was appointed governor of Hiogo, and in 1869 vice minister of finance. He then became prominent as an advocate of uniform coinage. In this connection he visited the United States and after studying the financial system of that country returned to Japan with the recommendation that the decimal system of money be

adopted, which was done, and a mint established at Osaka. In 1871-1873 he made a tour of the world, as a member of Prince Tomomi Iwakura's embassy, for the purpose of revising or modifying the treaties then in force. In 1872 he became minister of public works in which office he established a college of engineering and secured the building of the railway from Yokohama to Tokyo. In 1876 he again visited Europe to study the constitutions of the various countries for the purpose of remodelling that of Japan. On his return he inaugurated a radical plan for changing social customs. Having become minister president of state he started these reforms in the government offices, eliminating men of the old schools and substituting men of modern training and thought. He also reconstructed the laws and codes according to the ideas of western countries and carried out many reforms in economy. In 1882, the emperor, desirous of adopting the constitutional form of government, commissioned Ito to proceed to Europe and America in order to investigate the governmental systems of the two continents. While in Europe he attended the coronation ceremony of Czar Alexander III, as a representative of Japan, and returning in the following year, he began the work of drafting the constitution of the Empire. One year later Ito was appointed minister of the imperial household and created count.

As premier for four various periods between 1886 and 1901, he successfully saw the constitution that he and Kimmochi Saionji had so laboriously worked on proclaimed in 1889, was appointed president of the House of Peers when the Japanese Imperial Diet first convened, and concluded with China the Shimonoseki Treaty after the Chinese-Japanese War of 1894-1895 (for which he was created marquis in 1895). He resigned his fourth premiership in June 1901 and was later appointed president of the privy council. He failed to reach an understanding with Russia and at once opened negotiations which resulted in the Anglo-Japanese alliance of 1902. During the war with Russia (1904-1905) Marquis Ito, as one of the "elder statesmen" was the most trusted counsellor of the emperor. After the conclusion of peace which he did much to bring about, he was twice dispatched to Korea, these visits resulting in the Japan-Korea Treaty, declaring the Japanese protectorate over the peninsula. The marquis was ultimately appointed resident general of Korea, which high office he held until 1909 when he retired to become president of the privy council. He was assassinated by a Korean while visiting Manchuria.

Bibliography.—Kuramata, K., *A Maker of New Japan: Marquis Ito's Experience* (London 1904); Ladd, G. T., *In Korea with Marquis Ito* (New York 1908); Nakamura, K., *Prince Ito, the Man and Statesman* (New York 1910).

ITRI, town, Italy, in Rome Province, Latium, six miles north-northwest of Gaeta. It contains many ancient remains and has many houses erected from stone taken from the Via Appia, which runs past the town. Itri, with its cork industry, was heavily damaged during World War II. Pop. (1936) 6,219.

ITURBI, ê-tōor'bê, José, Spanish-American conductor and pianist: b. Valencia, Spain, Nov. 28, 1895. One of the finest of concert pianists in contemporary America, Iturbi has given more concerts in the United States than any other pianist, with the exception of Ignace Jan Pade-

rewski, and has broken box office records wherever he appeared.

He studied piano at the Valencia Conservatory (1908) and the Paris Conservatory, graduating with highest honors in 1912. After playing a short while in a fashionable café in Zurich, he became head of the pianoforte department of the Geneva Conservatory (1919-1923), leaving to devote himself to concert recitals. He was an immediate success, touring all of Europe, South America, and, from 1928, the United States with constant acclaim.

In one year alone (1930) he played 77 concerts in America, and during his tours averaged 100 concerts a year. In 1933 he turned his attention to conducting, directing 15 concerts at Mexico City and later that year appearing as a conductor at the Lewisohn Stadium, New York City. He appeared in 1934 as guest conductor of the Philadelphia Orchestra and since then he has continued to conduct major orchestras throughout the United States, being appointed permanent director of the Rochester Philharmonic Orchestra in 1936.

In 1938 he toured South America as conductor and pianist, and in 1941 took out citizenship papers in the United States. He has appeared in several motion pictures, among them *As Thousands Cheer* (1944), *anchors Aweigh* (1945), and *Three Daring Daughters* (1948).

ITURBIDE, ê-tōor-bê'thà, Agustín de, emperor of Mexico: b. Valladolid (now Morelia), Mexico, Sept. 27, 1783; d. Padilla, State of Tamaulipas, Mexico, July 19, 1824. In 1810 he was lieutenant in the provincial regiment of his native city, but on the breaking out of the troubles in Mexico joined the royalist party, and in this cause displayed such valor and ability that in 1816 he rose to the command of what was called the Northern Army, which occupied the provinces of Guanajuato and Michoacán. In 1820 the imprudent acts of the Spanish Cortes produced so much exasperation among the clergy and the partisans of absolutism in Mexico that these persons united to effect the independence of their country, selecting Iturbide as their agent and appointing him commander of the army in the south. He issued with Vicente Guerrero the Plan of Iguala for the unification of Mexico in February 1821, and other revolutionary forces quickly joined him. He quickly bore down all opposition, forced the signing of the Treaty of Córdoba in August 1821 acknowledging Mexico's independence, and was proclaimed emperor of Mexico in May 1822 under the name of Agustín I.

His troubled reign, during which he showed great arrogance, disregard of all constitutional restraints, and cruelty toward his opponents, came to an end in less than a year, by his abdication in March 1823, after Santa Anna's pronouncement against him. He went with his family to Leghorn, Italy, where he resided for a year until he was induced to make an attempt to recover his lost crown. He first went to London where he published his famous *Statement of Some of the Principal Events in the Public Life of Agustín de Iturbide* (translated into English in 1824) and sailed for Mexico, May 11, 1824. He landed with but a single attendant at Soto la Marina on July 15, 1824, but immediately was arrested and four days later was shot by order of the state of Tamaulipas without even being given a chance to appeal to Congress. His remains

were, in 1838, brought to Mexico City and repose in its cathedral. At the same time he was officially invested with the title "Liberator." See also MEXICO—History.

Bibliography.—Bustamante, C. M. de, *Historia del Emperador Agustín de Iturbide* (Mexico 1846); Navarro y Rodrigo, Carlos, *Agustín de Iturbide* (Mexico 1906); Bulnes, Francisco, *La Guerra de Independencia, Hidalgo-Iturbide* (Mexico 1910).

ITUREA or **ITURAEA**, it-û-rê-â, Biblical country, Palestine, the historical name of the district now in the province of Damascus, Syria, south of Mount Hermon and northeast of the Sea of Galilee. The Ituraeans were seminomadic Arabs, supposed to have been descendants of Jetur, a son of Ishmael, who had migrated northwards from Medina. In the 2d century B.C. they were subjugated by Aristobolus I (Judah), "the friend of the Greeks" and king of Judaea, who added their land to his kingdom and compelled them to accept Judaism. In 20 B.C. the district came under the rule of Herod the Great and at his death (4 B.C.) fell to his son Philip the Tetrarch, who is mentioned by Luke 3:1 as tetrarch of the Iturean and Trachonitic region. In 44 A.D. the district became part of the Roman province of Syria, and many of the inhabitants became soldiers in the Roman legions. They were celebrated as archers, brave and fearless, often mentioned by Julius Caesar, Strabo, and Flavius Josephus. Marc Antony is accused of attempting to intimidate the Roman Senate with his Ituraean guards by Cicero in his *Philippics*.

ITZA, êt'sâ, a Mayan people of northern Guatemala. They came thither from Yucatán in the 15th century after the fall of the Maya Empire and settled on the shores of Lake Petén. Hernando Cortes saw them in 1525 but the Spaniards did not subdue them until 1697 when their city was taken and pillaged. The records of this people date back to the 4th century and references to them are frequent in all Maya chronicles. Many of their records were destroyed by the Spaniards at the time of the conquest.

ITZCOATL, ish-kô-â-t'l, or **IZCOHUATL**, first Aztec emperor: b. 1360?; d. ?1440. His reign began in 1427. With his tribe of Tenochas he formed a confederacy with the rulers of Texcoco and Tlacopan against Maxtla of Tepanec, whom they captured after a short campaign and sacrificed to their gods. Itzcoatl instituted many reforms and greatly improved the state of his realm, making Tenochtitlán (Mexico City) a great power and cultural center.

Consult Bancroft, H. H., *Native Races*, vol. 5 (San Francisco 1882).

ITZEHOE, it'sê-hô, town, Germany, in Schleswig-Holstein, on the Stor River, 33 miles northwest of Hamburg. It has cement factories, carpet mills, sugar mills, and shipyards, and manufactures soap, chemicals, cigars, nets, wall-paper, machinery, and pumps. It carries on a considerable trade in cattle, grain, lumber, and wine. Among its ancient buildings are the 12th century church of St. Laurence and a convent, now Protestant, founded in 1256. It grew around a castle erected here in 809 and is consequently the oldest town in Holstein, receiving municipal rights in 1238. Pop. (1956) 34,257.

IUKA, i-û'ká, town, Mississippi, seat of Tish-

omingo County, 20 miles east-southeast of Corinth, served by the Southern Railroad, in the extreme northeast part of the state. It has manufactures of brick, tile, and crossties, and there are limestone, sandstone, and clay deposits and a mineral spring nearby.

The town was the scene of a severe engagement during the Civil War. Early in September, 1862, it was occupied by a small Union regiment as an outpost. On the morning of September 13, Gen. Sterling Price, moving north from Tupelo with a force of 14,000 men, drove the Union regiment from the village and occupied it. Gen. Ulysses S. Grant had been closely watching the movements of Price and when he heard that he had occupied Iuka he determined to attack. Gen. William S. Rosecrans, who was near Corinth with 9,000 men, was ordered to move south to Rienzi and Jacinto, then eastward and, marching on the roads from Jacinto and Fulton, to attack Iuka from the south. Gen. Edward O. C. Ord, with 6,000 men, was to move along the Memphis and Charleston Railroad to Burnsville, thence by roads north of the railroad, and to attack on the north and west of Iuka.

General Rosecrans made first contact with the enemy on September 19, but due to a confusion of orders, General Ord failed to thrust down at the same time, allowing the Confederate forces to escape from the trap after a severe fight. General Price retreated southward and reached Baldwyn on September 23d. Rosecrans and Ord returned to Corinth. Rosecrans reported a loss of 141 killed, 513 wounded, and 36 missing; Price reported a loss of 86 killed and 408 wounded, although Union estimates placed it much higher. The town was incorporated in 1857. Pop. 2,010.

IVAN I, i-vàn' (called **IVAN KALITA**, *Moneybags*), prince of Vladimir and grand duke of Moscow: d. 1341. As the prince of Vladimir he was made collector of taxes by the Tatar khan, and by following the policy of rigorously enforcing the payment of tribute to the Tatars, he was able in a short while to dominate Moscow and Tver and also assure his realms of privacy from Tatar intervention. He became grand duke of Moscow in 1328 and vastly extended the dominions of his empire, annexing Rostov in 1330 and Smolensk in 1340. He worked ceaselessly for the unification of his realm, overseeing monetary matters even to the smallest amounts (hence his nickname, Moneybags) and causing the metropolitan see to be transferred to Moscow, thus increasing immensely the importance of the Muscovite kingdom.

Bibliography.—Soloviev, S. M., *Istoriya Rossii*, vol. 3 (Moscow 1851-59); Presnjakov, A. E., *Obrazovanie velikorusskogo gosudarstva* (Petrograd 1918); Vernadsky, G., *Ancient Russia* (New Haven, Conn. 1943).

IVAN II (called **IVAN KRASNÝ**, *the Red*), grand duke of Moscow: b. 1326; d. 1359. The younger son of Ivan I, he became grand duke of Moscow in 1353. Novgorod and several other principalities refused to recognize his title and waged war with him until 1354. His rule was generally weak and colorless, with most of his principalities vowing allegiance but privately going their separate ways. He was the father of Demetrius Donskoi, who built the Kremlin and fought against the Tatars, and by his will divided his dominions among his children, thus increasing the internal discord. For bibliography see **IVAN I**.

IVAN V, Romanov czar of Russia: b. Aug. 27, 1666; d. Jan. 29, 1696. The son of Czar Alexis I and the half brother of Peter I, with whom he shared the throne, he was a physically and mentally weak ruler, leaving the management of his affairs entirely to his half sister, Sophia, who attempted through various ruses to dethrone Peter and have herself proclaimed empress. Meanwhile Ivan gave himself entirely to religious devotions, and when Sophia was overthrown in 1669 he was deposed. One of his five daughters, Anna Ivanovna, later ascended the throne as empress (r. 1730–1740).

Bibliography.—Soloviev, S. M., *Istoriya Rossii*, vols. 13 and 14 (Moscow 1851–59); Schlieemann, T., *Russland, Polen, und Livland bis ins 17. Jahrhundert*, 2 vols. (Berlin 1886); Bain, R. N., *The First Romanovs* (London 1905).

IVAN VI, Russian czar: b. Aug. 24, 1740; d. Dec. 5, 1764. He was the son of Princess Anna Leopoldovna and Prince Anthony Ulrich of Brunswick-Bevern and the great-grandson of Ivan V. He was named successor to the Russian throne by Anna Ivanovna and on her death in 1740 was proclaimed czar at the age of eight weeks, under the regency of Ernst Johann Biron, duke of Kurland. The latter was overthrown by Ivan VI's mother who assumed the regency, and in December 1741 Elizabeth, the younger daughter of Peter the Great, through a coup d'état, became empress. The infant czar was thrown into prison where he was destined to spend the rest of his days. In the fortress of Schlüsselburg, after 22 years of solitary confinement which had succeeded in deranging his mind, he was murdered by some officers in whose charge he was put to forestall an effort to liberate him.

Bibliography.—Manvillon, E. de, *Histoire de la vie d'Iwan VI* (Paris 1766); Stählin, K., *War der 1764 getotete Gefangene von Schlüsselburg der russische Ex-kaiser Iwan VI?* (Berlin 1927); id., *Geschichte Russlands*, vol. 2 (Berlin 1930).

IVAN III VASILIEVICH (called **IVAN THE GREAT**), grand duke of Moscow: b. Jan. 22, 1440; d. Oct. 27, 1505. He succeeded his father, Basil II, as grand duke of Moscow in 1462 and continued energetically to strengthen the leadership of Moscow. From 1471 to 1478 he waged two wars on Novgorod, the strongest principality next to Moscow in Russia, and finally conquered and annexed it to the Muscovite kingdom. To further unification, he refused to recognize his brothers' claims to continue lineal inheritance of their principalities and by threat or actual war annexed the principalities of Yaroslavl (1463), Rostov (1474), and Tver (1485).

In 1480 he refused to pay the onerous tribute to the Tatar khan and successfully threw off the yoke of Tatar rule in spite of attempts by the latter to regain sovereignty by threat of arms. To gain access to the sea, he twice invaded Lithuania (1492 and 1501), finally acquiring in 1503 a part of it by treaty.

As a result of his second marriage in 1472 to Sophia (Zoë), daughter of Thomas Palaeologus, brother of the last Byzantine emperor, autocratic forms of government and court ceremonies gradually developed at Moscow. This marriage was also important, in establishing the claim of Moscow as the protector of Orthodox Christianity. As a further symbol of his identity with the Byzantine Empire and Orthodox Christianity, he adopted the Byzantine double-headed eagle into the Muscovite coat of arms. Ivan did much to

introduce western civilization into his domains and was also responsible for the compilation of the first Russian law code. The boyars or nobles fell from their high position as advisors to the duke and became mere fiefs of the sovereign. By his last will, leaving all his dominions to the next reigning grand duke rather than dividing them customarily among his children, he established Muscovy as a permanently unified realm.

Bibliography.—Soloviev, S. M., *Istoriya Rossii*, vol. 5 (Moscow 1851–59); Pierling, P., *La Russie et L'Orient* (Paris 1891); id., *La Russie et le Saint-Siège*, vol. 1 (Paris 1896); Ilovajskij, D. I., *Istoriya Rossii*, vol. 2 (Moscow 1898).

IVAN IV VASILIEVICH (called **IVAN THE TERRIBLE**), Russian ruler: b. Aug. 25, 1530; d. March 17, 1584. The son of Basil III and grandson of Ivan III, he was proclaimed ruler of Muscovy at the age of three, ruling under the regency of his mother until 1538 and under the regency of the boyars from 1538 to 1544, when at the age of 14 he assumed control of the kingdom himself. On Jan. 16, 1547 he had himself crowned czar of Russia, the first ruler to dare do so, and immediately began forming his government. Having formed a lasting hatred of the power-conniving boyars, he completely broke with them and surrounded himself with able men of humble origin whose interests were primarily for the good of Russia and not themselves.

In 1550 he held the first meeting of the national assembly (Zemski Sobor) and in 1551 he even went so far as to submit a hundred questions to a gathering of prelates concerning the betterment of the government. Constantly seeking ways to enlarge his kingdom, he conquered the khanates of Kazan in 1552 and Astrakhan in 1554. His efforts to acquire additional territory in Livonia and Estonia, though carried on with large forces from 1557 to 1582 almost without intermission, failed as a result of the stout resistance of Poland and Sweden. It was during his reign that the conquest of Siberia was completed by Cossack forces under Ermak Timofeev.

Ivan IV was a peculiar mixture of political sagacity and admiration of western civilization and eastern barbarity. He was an indefatigable worker, comparatively well educated, but possessed such a strong strain of cruelty and immorality that it amounted at times almost to madness, especially after a series of events, including the death of his wife and son, turned him against the world and made him suspect all of attempting to harm him. Amongst his many barbarous deeds was the almost complete destruction of Novgorod and the slaughter of thousands of its inhabitants as punishment for an unproven attempt at revolution (1570). Another deed of similar nature was the killing of his beloved son Ivan by a blow, given in a moment of uncontrollable fury. Twice during his rule (1564 and 1580) he publicly expressed a desire to abdicate, but was persuaded to continue on the throne.

IVANHOE, i'văn-hō, a romantic novel of love and adventure in the days of chivalry, by Sir Walter Scott, published in 1820. The scene is England during the late 12th century when sturdy Saxon yeomen still hoped for restoration of their royal line and expulsion of the hated Norman conquerors—those brilliant feudal lords, endowed with all knightly graces but haughty and tyrannical. Scott provides memorable pictures of these antagonistic elements. The patriarchal home of Cedric the Saxon, in which master and serf live on terms of kindly familiarity, contrasts with life in a typical Norman castle, with courtly manners of hall and bower and the dark mysteries of its gloomy dungeon. Cedric's son Ivanhoe has been disinherited because of his love for the noble Saxon heiress Rowena, whom Cedric hopes to marry to a descendant of Edward the Confessor and thus, by uniting Saxon factions, compass a restoration of the ancient Saxon monarchy. The large and varied cast of characters includes Richard Coeur de Lion, King John, Robin Hood, a Knight Templar Brian de Bois Guilbert, a proud nobleman Maurice de Bracy, the Jew Isaac and his beautiful and virtuous daughter Rebecca.

JAMES H. HANFORD.

IVANOVO, i-vă'nŭ-vŭ, oblast, USSR, in the central European part of the Russian SFSR. It is a wooded steppe area with a moist climate, 9,500 square miles in area. The region has large cotton cloth and chemical industries, and mines peat extensively. There are textile centers at Ivanovo (the capital), Rodniki, Furmanov, Kokhma, and Teikovo, and linen mills at Privolzhsk and Puchezh. Agriculture is important, the main farm products being truck produce, dairy products, tobacco, chicory, wheat, and flax. The oblast was formed in 1929. Pop. (1956 official est.) 1,351,000.

IVANOVO, city, USSR, capital of Ivanovo Oblast in the Russian SFSR. It lies south of the Volga River, about 155 miles northeast of Moscow on the unnavigable Uvod River. It has railways to Moscow, the Ural Mountains, and Archangel. The town of Ivanovo was founded in 1328 and during the 17th century became a commercial center. The city was formed in 1871 by the merger of the two towns of Ivanovo and Voznesensk, and until 1932 it was officially styled Ivanovo-Voznesensk. The city is often called the "Soviet Manchester" because it is one of the largest centers for cotton cloth manufacture in the USSR. There are also machine-building factories and other heavy industries. Most of the city's colleges and research institutes specialize in textile and chemical studies. The large worker population took an active part in the revolution of 1917-1918, and the town was made temporary capital of the revolutionary government in 1918. Pop. (1956 official est.) 319,000.

IVES, Burl (Icle Ivanhoe), ivz, American guitarist and folk singer: b. Hunt Township, Jasper County, Ill., June 14, 1909. He learned to sing Anglo-American folk songs and ballads in childhood, from his parents (Frank and Cordella White Ives) and his grandmother (Kate White), and at the age of four earned his first quarter by singing *Barbara Allen* at an old soldiers' picnic. After graduating from Newton (Ill.) High School, he studied (1927-1929) at Eastern Illinois State Teachers College in Charleston, where he

paid for his meals by singing to the accompaniment of his banjo and guitar. In 1929 he embarked on an extended trip, during which he hitchhiked, rode the rails on freight trains, and earned his living by singing in Canada, Mexico, and 46 of the United States. Later he settled in Terre Haute, Ind., where for two years he sang over the local radio station and played professional football. For several months he was a member of the Reverend J. Frank Norris' company of traveling evangelists.

About 1937, Ives went to New York City, where he lived for a time at International House, Columbia University, working as a bus boy and singing in churches. He started his network radio career in 1940, singing first for the National Broadcasting Company and later over the Columbia Broadcasting System in a program entitled *The Wayfarin' Stranger*, named for the title of the ballad he had made famous, *I'm a Poor Wayfarin' Stranger*. He came much in demand for concert appearances, and his phonograph records achieved tremendous sales. His mellow voice and intimate, highly individual style did much to popularize American folk songs, which he presented in a simple and direct manner, without elaborate arrangements or distortions.

Ives also developed a distinguished stage career as a dramatic actor. He first appeared professionally as an actor at the Rockridge Theatre in Carmel, N.Y., in the summer of 1938. Later that year he appeared on Broadway in *The Boys from Syracuse*, and in 1939 in the road company of *I Married An Angel*. In 1942-1943 he was in the United States Army, and appeared in Irving Berlin's soldier show, *This Is the Army*. He subsequently scored a distinguished dramatic success in Tennessee Williams' *Cat on a Hot Tin Roof*, in which he starred on Broadway in 1955-1956. His autobiography, *Wayfaring Stranger*, was published in 1948, and his *Song Book* in 1953.

JOHN TASKER HOWARD.

IVES, Charles Edward, American composer: b. Danbury, Conn., Oct. 20, 1874; d. New York, N.Y., May 19, 1954. An experimentalist in musical forms, Ives is credited with being the pioneer of atonality, first developing such devices as major and minor seconds, quarter tones, polyrhythms, and polyharmonies, which Igor Stravinsky and Arnold Schönberg were to use with success later.

Ives was first taught harmony, counterpoint, and instrumentation by his father, who had served as a regimental bandmaster during the Civil War. As a boy of 13, he was organist at the Congregational Church in Danbury, Conn. At Yale University, where he graduated in 1898, he studied composition under Horatio Parker and organ under Dudley Buck. From 1893 to 1902 he was organist and choirmaster at churches in New Haven, Conn., Bloomfield, N.J., and New York City. In 1898 he became a clerk with an insurance company, and from 1916 to 1930 he was the senior member of Ives & Myrick, one of the largest insurance brokerage firms of its kind in the United States.

Ives' works include 4 symphonies, 4 violin sonatas, 2 piano sonatas, 3 orchestral suites, 11 volumes of chamber music, choral music with or without orchestra, organ music, and about 200 songs. Most of his work was written before 1916, but its extreme deviation from the accepted patterns of music and the author's personal shyness kept the compositions in obscurity for several decades.

Ives continually experimented with unusual chord structures, harmonic rhythms, and exotic scales; the result was music characterized by complex chromaticism and polytonalism. He used American themes almost exclusively in his choral works and songs. His second sonata, *Concord, Massachusetts, 1840-1860*, written between 1909 and 1915, is divided into four movements entitled *Emerson*, *Hawthorne*, *The Alcotts*, and *Thoreau*. Published in 1919 and first fully performed 20

years later, it is considered to be his best piece. In 1947 his *Symphony No. 3*, played the preceding year for the first time with full orchestra, was awarded the Pulitzer Prize. Further recognition followed in 1948 when he received the Henry Hadley Medal from the National Association for American Conductors and Composers.

IVES, Frederic Eugene, American inventor: b. near Litchfield, Conn., Feb. 17, 1856; d. Philadelphia, Pa., May 27, 1937. Leaving school at the age of 11, he became a printer's apprentice, studied photography on his own, and from 1874 to 1878 directed the photographic laboratory at Cornell University. In the latter year he invented the first practicable halftone photoengraving process, which he applied initially in Philadelphia in 1881; in 1886 he improved the process, which then came into general use. Ives also invented the Kromskop process of color photography (1891) and the later Tripak process (1912), and was a pioneer in the development of motion pictures in color (1914). Among many honors, he received the Rumford Medal of the American Academy of Arts and Sciences (1912). His *Autobiography of an Amateur Inventor* appeared in 1928. See also PHOTOGRAPHY—*Color Photography Processes*.

IVES, Herbert Eugene, American physicist: b. Philadelphia, Pa., July 31, 1882; d. Upper Montclair, N.J., Nov. 13, 1953. Son of the inventor Frederic Eugene Ives (q.v.), he was educated at the University of Pennsylvania (B.S., 1905) and Johns Hopkins University (Ph.D., 1908), and from 1919 to 1947 was a member of the technical and research staff of the Bell Telephone Laboratories. Here he developed the first transmission of pictures over telephone wires (1924) and was in charge of the work which resulted in the first successful television broadcast (1927). Color television was demonstrated later the same year, and two-way television three years after. Ives also invented a moving atomic clock, which measures the motion of electrons; an artificial eye for use in photometry; and a lamp for the production of artificial daylight.

IVES, James Merritt, American lithographer: b. New York, N.Y., March 5, 1824; d. Rye, Jan. 3, 1895. He was born in a cottage on the grounds of Bellevue Hospital, where his father was superintendent. His formal education was slight, and he went to work at the age of 12, but his interest in art was so great that he spent many hours in self-study in galleries and libraries. Ives married a sister-in-law of Nathaniel Currier (q.v.), who in 1834 had established a lithographing business in New York City. In 1852 he was employed by Currier as a bookkeeper, but it soon became evident that he was more than that; he had a keen sense of organization which almost immediately enabled him to qualify as business manager. His carefully acquired knowledge of art was greater than his employer's, and his natural feeling for popular taste was an added value. In 1857, Currier took him into partnership, and the firm name of Currier & Ives began to appear on lithographs.

Ives directed the activities of a large staff of artists, choosing and assigning them. He learned lithography, and it is believed that he actually executed some of the firm's prints himself. His ideas went into many others. He devoted his life

entirely to the business, leaving it once briefly for service in the Civil War as the organizer and captain of Company F of the 23d Brooklyn Regiment. He remained active in the business until his death. See also CURRIER & IVES.

RUSSEL CROUSE.

IVIZA. See IBIZA.

IVORY, ἰῡό-ρι, **SIR James**, Scottish mathematician: b. Dundee, Scotland, 1765; d. London, England, Sept. 21, 1842. Educated at the University of St. Andrews, he was professor of mathematics (1804-1819) at the Royal Military College at Great Marlow, Buckinghamshire (removed to Sandhurst in 1812). In 1809 he read a notable paper to the Royal Society on the problem of the attractions of ellipsoids, presenting the theorem which bears his name. Some of his other major contributions include a method of determining the orbit of comets (1814) and a theory of astronomical refractions (1838). He received the Copley Medal (1814) and two other gold medals from the Royal Society, of which he became a fellow in 1815, and was knighted in 1831.

IVORY AND IVORY CARVING. Ivory is properly a type of dentine present only in the tusks of the elephant, although the term is loosely applied to the tooth structure of the walrus, hippopotamus, whale, and others. "Green" ivory (from freshly killed animals) is easier to work than the more brittle "dead" ivory. African ivory, because of its density, whiteness, and ability to take a polish, is valued in commerce. Asiatic ivory, a chalky white when green (though it yellows quickly) and of coarser grain, was apparently preferred in imperial Rome for the official diptychs (two-leaved writing tablets), as the poet Claudian (c. 400 A.D.) informs us. This preference is confirmed by a carving on the lower plaque of a leaf from the Barberini diptych in the Louvre (Paris), showing Indians bringing elephants' tusks to the emperor. Elephants' tusks average about 50 pounds, but have been known to reach a weight of over 200.

The leading ivory markets of the world are Antwerp, London, and Liverpool. In the West, ivory is used as material for knife handles, the backs of brushes, billiard balls, piano keys, combs, and small ornamental objects. India, China; and Japan supply toys, house models, chess- and checkermen, puzzles, and the like. The diminishing supply of true ivory and increased costs have led to the use of substitutes such as vegetable ivory (q.v.), celluloid, and others.

General History.—Although carving in ivory and bone has been practiced from earliest times to the present, it does not present a continuous development but rather a sequence of "schools," interrupted by barren periods. A notable instance is the period between 600 and 800 A.D., almost totally deficient in extant examples, a deficiency explained in part by the Arab conquests in the Mediterranean Basin, which must have interfered with the normal ivory trade from Nubia and India. The European ivory carver, after the depletion of the elephant herds which once inhabited North Africa and western Asia (elephants were hunted in Syria as late as 1000 B.C.), was dependent upon a remote source of supply. The problem of supply may be a factor in explaining the popularity of morse ivory (walrus tooth) in the Middle Ages, particularly in England.

The suitability of ivory for carving, as well as its rarity, has given it an honored place in the adornment of the palaces of kings and of temples to the gods in all ages. The ancients deemed ivory particularly suitable, either alone or in conjunction with gold (the only metal thought worthy of being combined with it), for the rich inlay of ceilings, for thrones, scepters, horse trappings, and other furnishings, and for sacred objects. Solomon's throne was of ivory overlaid with gold. The hero of Homer's *Odyssey* tells of a marriage bed which he "made fair with inlay work of gold and of silver and of ivory." The Greeks combined gold and ivory for their colossal statues of the gods (called chryselephantine), the flesh parts being of ivory and the draperies of gold. The most famous examples are the seated Zeus at Olympia (one of the Seven Wonders of the World, q.v.) and the Athena (438 B.C.) that stood in the Parthenon, her temple on the Acropolis at Athens, each about 40 feet high, by the sculptor Phidias. In Rome, ivory was lavished on the houses of the rich to such an extent that the poet Horace (65-8 B.C.), to show that he was not wealthy, wrote that neither ivory nor a ceiling of gold glittered in his house.

In the Middle Ages, particularly in Carolingian and Byzantine art, ivory carving assumed an importance far beyond its intrinsic merits. With the almost complete cessation of stone sculpture in the East for religious reasons, ivory carving helped to bridge the gap between late antiquity and the 12th century Romanesque and later revivals. After the 12th century, although much accomplished and charming work was produced (as in France in the 13th and 14th centuries and in Germany and Flanders from the 17th to 18th), ivory carving became a minor art and ceased to have the same significance. Up to the 16th century, ivory carvings seem always to have been colored or gilded, and were often encrusted with jewels or paste and combined with precious metals.

Paleolithic.—The oldest extant carvings in ivory or bone belong to the Old Stone Age. From the caves of France and Spain come a number of

Pape at Brassempouy (French Pyrenees) and are in the museum of St. Germain, France. Among them is a girl's head, carved with grace and delicacy, contrasting with the crudity of the torsos; she has long hair, and her eyes and mouth may have been added with paint. The statuettes seem to antedate the numerous incised renderings of animals and fish, done with great truth to life, carved on reindeer horns and throwing sticks of the same material, which are probably Magdalenian (c. 20,000-12,000 B.C.).

Egypt.—The popularity of ivory in Egypt is shown by such names as Abydos (ivory city) and the island of Elephantine, designated by the picture (hieroglyph) of an elephant. It seems to have been used there for carving as early as 5,000 B.C. Nude female figures (fertility amulets) of various degrees of crudity appear, as well as ivory combs, hairpins, and various utensils, decorated with birds, animals, and men. One of the best early examples is a knife with an ivory handle from Gebel-el-Arak (now in the Louvre), with a battle scene between men of different races carved on one side. Two statuettes from Abydos are veritable masterpieces of art. One, a king of the 1st dynasty (c. 3000 B.C.; British Museum, London), shows an old man bent with age, wearing the crown of Upper Egypt and an embroidered cloak, rendered with a delicacy and truth never surpassed and rarely equaled in later Egyptian art. The other, in the Cairo Museum, portrays the seated figure of King Khufu (4th dynasty, r. 2590-2568 B.C.), builder of the Great Pyramid; despite its small size (5 inches high) it combines grace with royal majesty. From later periods come chiefly decorations on more utilitarian objects such as handles, spoons, and inlays for caskets or furniture, intended for burial in the royal tombs of the New Kingdom (1570-1075 B.C.). Characteristic are the whips and walking sticks from the tomb of Tutankhamen, in the Cairo Museum and The Metropolitan Museum of Art (New York City), and a comb in the Louvre with a falling ibex on the handle.

Western Asia (Babylonia, Palestine, Assyria).—Although examples before 2000 B.C. are rare, it is probable that ivory was used in Mesopotamia as early as in Egypt, for ornaments, toilet articles (such as mirror handles, combs, and boxes), and furniture inlays. From the later epoch two remarkable groups of carvings exhibit the skill of the craftsmen. The earlier group (c. 1350-1150 B.C.) comprises a number of carvings from Megiddo (Palestine), Byblos (Lebanon), and elsewhere, which make use of Egyptian as well as Babylonian motifs. Most characteristic, however, is the motif of the crested griffin (possibly Cretan in origin), shown at rest or attacking animals. The second group comes from Assyria and dates from the 9th and 8th centuries B.C. The 50 fine pieces in the British Museum, found about 1845 in the ruined palace at Nimrud (Calah, near Mosul, Iraq), were augmented in 1949-1953 by new finds. The latter include exquisitely carved heads (two of which, one in the Baghdad Museum and the other in the Metropolitan Museum of Art, New York City, 6½ and 5½ inches high respectively), the largest ivory heads from the Near East; boxes inlaid with gold with processions of figures; delicately carved animals of amazing vitality, such as a bull that supported an ivory tray; a cheekpiece for a horse with a seated sphinx and winged cobra of Phoenician style (both in the Metropolitan Museum of Art); and,

Metropolitan Museum of Art, Carnarvon Collection, 1926

A 3,500-year-old ivory gazelle from Thebes. On the base are paintings of characteristic Egyptian desert plants.

statuettes of women, carved of mammoth ivory and thus probably dating from the Aurignacian epoch (c. 40,000 B.C.), when the mammoth still inhabited Europe. A group of torsos with exaggerated breasts and thighs, suggesting their use as fertility symbols, were found in the Grotto du

Leningrad Museum, Bildarchiv Foto Marburg, Metropolitan Museum of Art, The American Museum of Natural History

IVORY AND IVORY CARVING: *Upper left:* Early Christian pyxis with a scene from the story of Jonah. *Top center:* Holy Family group from Cologne, carved about 1175. *Right:* Late 14th century Virgin and Child from France. *Lower left:* Japanese netsuke representing a performing street beggar. *Lower center:* A 17th century French or Flemish statuette of a child with a tambourine. *Lower right:* Assyrian head in ivory with a gold-inlaid necklace, about 715 B.C.

most important, fragments of 16 hinged ivory writing boards (13¼ by 5 inches), the sunken inner portion being scored for wax to provide a writing surface (some wax was preserved). These boards are from the time of Sargon II (r. 721-705 B.C.), and thus provide the earliest known evidence for writing on wax. Some of the objects may be imports from Phoenicia (the Phoenicians being noted for their skill in the craft), but most seem indigenous.

Aegean Basin, Etruria, Greece.—Parallelizing the Megiddo ivories are finds from the Aegean. From Enkomi (Cyprus) is a splendid gaming box (British Museum), carved with hunting scenes, and two mirror handles with combats between men and monsters, one of which (12th century B.C.) shows a man slaying a crested griffin. From Crete (Knossos) come ivory acrobats with loin cloths of gold, the epitome of graceful movement, and the gold and ivory "snake goddess" (6½ inches high; Museum of Fine Arts, Boston, Mass.), who wears a flounced skirt banded with gold, a high tiara pierced for gold attachments, and holds gold snakes in outstretched hands (c. 1500 B.C.). From the Greek mainland, particularly from Mycenae, come a number of ivories. Among them are statuettes of women in flounced garments; a ceremonial scepter (10¾ inches long); models of figure-of-eight shields and columns; and ivory inlays for furniture and caskets, ornamented with such typical Mycenaean motifs and spirals, dolphins, lily and ivy sprays, and running lions attacking calves. Perhaps the most remarkable ivory, found in 1950-1953 at Mycenae, is the

head of a warrior wearing the Homeric boar's tusk helmet (National Museum, Athens), carved almost in the round of solid ivory; it is better preserved and superior to similar heads found in the late 19th century, also at Mycenae.

From classical Greek cities, such as Ephesus and Sparta, come a number of statuettes and reliefs (8th to 7th centuries B.C.), which show affinities to Assyrian art (Nimrud group). Athens yields a unique find, from a single grave, of five statuettes (c. 750 B.C.), each a nude goddess standing erect, hands pressed to sides; they are pure Greek in the sensitive modeling of the youthful female form, precursors of later Greek statues. To the same period probably belong carvings from Etruscan tombs in Italy (for example, the Barberini tomb at Praeneste, modern Palestrina), which, with their processional bands of griffins, centaurs, and the like, suggest Eastern and perhaps Phoenician inspiration.

Until 1939 little was known of the famous chryselephantine Greek statues save literary descriptions. In that year were found the remains of eight such statues (three life sized), buried with other offerings beneath the sacred way leading to the Temple of Apollo at Delphi and dating about 600-550 B.C. Although the latest are a century earlier than the creations of Phidias, the method of construction must have been similar. The core of each statue was of wood, to which was attached by iron nails the gold or silver-gilt drapery with thin bronze sheets as a backing. Hair and ornaments (such as earrings and necklaces) were of gold. Two plaques, also of gold,

with an exquisite design beaten out on a mold (*repoussé*) and made up of friezes of Oriental animals (sphinx, griffin, winged horse), apparently adorned the front of one statue, being fastened by silver nails with gilded, enameled heads. The nude parts (such as face, neck, hands, toes) were of ivory and were attached to the core by wooden rivets, as metal might deface the surface by rusting.

Roman and Early Christian.—The Romans used ivory for all manner of purposes, both secular and religious. Since most extant examples come from the later period (4th to 6th centuries A.D.), when the empire was Christian as well as Roman, the only real distinction that can be made between pagan and Christian examples is in subject and use. Thus an oval pyxis, made from a section of an elephant's tusk, is presumed to be Roman if it is carved with scenes from classical mythology such as Venus and Adonis, Diana and Actaeon, or the Judgment of Paris (Walters Art Gallery, Baltimore, Md.); it probably served as a jewel box for a lady's boudoir. Christian pyxes, on the other hand, show Biblical scenes, particularly those that symbolize life after death or God aiding mortals. Very popular, therefore, are such themes as Jonah saved from the whale (as in a pyxis in the Hermitage, Leningrad, USSR) or Daniel in the lions' den (British Museum and Dumbarton Oaks Collection, Washington, D.C.) from the Old Testament, or Christ's miracles and Passion from the New Testament. A large pyxis (5¾ inches in diameter; 5th century), in the Kaiser Friedrich Museum, Berlin, combines the two, Abraham sacrificing Isaac and Christ seated among his apostles, carved in a fine classical style. From about 500 A.D. are two pyxes, almost identical in style, one pagan and the other Christian, both probably carved in Egypt (Alexandria). The pagan one (Landesmuseum, Wiesbaden, Germany) presents an Isis feast and a Nilotic scene; the other (British Museum) shows the martyrdom and tomb of St. Menas and once probably contained relics from his shrine near Alexandria. Other Christian pyxes were used to contain the Host: two examples are in The Metropolitan Museum of Art, one showing the miracle of the loaves and fishes and the other the holy women at the Tomb; another in the Cleveland, Ohio, Museum of Art depicts Christ raising Lazarus from the dead and other New Testament scenes. Christ throughout is portrayed like a Greek god, beardless, with short curly hair.

The most important Roman ivories are the diptychs (two-leaved writing tablets), particularly those issued by the consuls upon assuming office for presentation to their friends, as they are the only dated ivories of the period. Over 50 are preserved, from a leaf of Probus (Aosta, Cathedral Treasury, Italy), issued in 406 A.D., to the diptych of Justinus (Kaiser Friedrich Museum, Berlin) of 540–541 (when the consulship was abolished), including eight of a single consul, Areobindus (506). The two leaves of the diptychs are fastened together with hinges. The interior is recessed for the insertion of wax for writing with a stylus, and the exterior is carved in relief, usually showing the consul standing or seated on his special chair with name and titles inscribed above, and below a scene from the amphitheater, such as beast fights or acrobatic scenes. The 5th century diptychs, all of consuls of Rome and apparently carved locally, are of Roman style with an occasional attempt at portraiture (for example,

the diptych of Felix 428, in the Bibliothèque Nationale, Paris). The 6th century ones, however, exhibit the frontality and ornateness of the hieratic, "Asiatic" style (Early Byzantine) and seem to have been mass produced in some Eastern city (Alexandria or Constantinople), the inscription to be added when purchased. On a diptych of Anastasius (517; Bibliothèque Nationale, Paris), for instance, the seated consul (repeated on each leaf) is a type, not an individual; the small figures of gladiators at the bottom, however, are treated more freely, resembling those of the pyxes.

The same combination of classical (Hellenistic Greek) and Eastern elements occurs on the imperial five-part consular diptychs (for example, the Barberini diptych, whose Christian origin is revealed by the youthful bust of Christ at the top); the book covers in the Library of the Monastery at Etschmiadzin (Armenia) and in the Bibliothèque Nationale, Paris, with the life of Christ and Mary; and the episcopal chair in the Museum, Archbishop's Palace, Ravenna, Italy, with a monogram referring to Maximianus (consecrated bishop of Ravenna in 546). The chair, made of ivory panels (39 originally, exclusive of borders; 12 missing) on a wooden frame, presents the figures of John the Baptist and the four Evangelists set in niches on the front, and the life of Christ and Joseph on the back and sides, all carved in a lively Hellenistic style; but the vine-scroll ornament that surrounds the figure panels shows the Asiatic interest in abstract design and patterns of light and dark. This chair, undoubtedly the finest ivory of the period, was probably carved about 500 A.D. by Greek artists (perhaps in Alexandria) and later purchased by Maximianus. Closely related in style is a fine plaque (16½ inches high) in the British Museum, with the Archangel Michael standing at the top of a flight of steps and holding a staff and globe; the Greek inscription above, "Receive this gift, and having learned the cause . . ." suggests that the missing leaf with the rest of the inscription may have shown the emperor for whom the gift was probably intended.

A number of Christian carvings, Roman rather than Greek-Asiatic in style, resemble the 5th century consular diptychs (for example, Lampadius, c. 428; Boethius, 487) and the private diptychs, such as one in the Civic Museum, Liverpool, England, with Aesculapius and Hygeia, or the marriage diptychs of the Symmachi and Nicomachi families, Victoria and Albert Museum, London; Cluny Museum, Paris of about 394 (unique in its "refined" Greek style). These Christian carvings include a cover in the Cathedral of Milan in Italy; a plaque in the Bavarian National Museum, Munich, Germany, with the women at the Tomb and the Ascension of Christ; and two rectangular caskets, one in Brescia, Italy (Museo Civico Cristiano), with Old and New Testament scenes on sides and lid (late 4th century), and another in the British Museum with the Passion of Christ, notable in that it presents probably the earliest rendering of the Crucifixion (c. 425). Not only does the style continue the Roman tradition of careful modeling in low relief, but the subjects are also Western in treatment. Thus Christ sits astride the ass in his entry (not sidesaddle as in the East); the Holy Sepulcher is incorrectly shown as a two-storied structure, and so on. The influence of these Western ivories upon later art is shown by another cover, in the Bodleian Library, Oxford,

of the early Carolingian age (c. 800), which is directly copied from a 5th century diptych, two panels of which are preserved (Kaiser Friedrich Museum, Berlin; Louvre, Paris).

Byzantine.—In contrast to the variety of styles of early Christian art is the uniform excellence and high degree of artistic refinement that characterize the ivories of the main Byzantine period (10th to 12th centuries A.D.), after the ban on religious images (726–842) was removed. The rectangular caskets, often decorated with subjects from mythology and therefore for secular use, may have originated during the controversy, when sacred images were forbidden, but most are later, including the one from Veroli, Italy, in the Victoria and Albert Museum, London (10th to 11th century), the best of about 50 known; the panels are attached to a wooden frame and the borders contain rosettes in circles. The most important ecclesiastical objects are diptychs, triptychs (three-leaved alterpieces), and single panels. Possibly transitional in style (7th to 10th century) is a panel in Milan (Castello Sforzesco) with the Annunciation set before sharply receding architecture; Gabriel recalls the Michael of the London plaque, but both he and Mary have become flatter and show less organic articulation.

The characteristic style of the carvings of this period presents a perfect fusion between Greek and Eastern ideas, the former dominant in the classic restraint and insistence upon symmetry. The Greek triangle, for instance, forms the basic design of a panel in Paris (Bibliothèque Nationale), which shows Christ, standing on a high pedestal, crowning the emperor (probably Romanus IV, r. 1067–1071) and the empress. The three figures are set in isolation against a plain background; Christ, long-haired and bearded, is clad in flowing robes that reveal something of the body beneath, but the imperial pair have the rigidity of the Asiatic style. More Eastern in spirit is the famous Harbaville triptych in the Louvre, with Christ enthroned between John the Baptist and Mary in the central panel, the lower portion and the wings being filled with formal rows of apostles and saints. Both, however, transcend reality and transform the ivories into devotional icons for veneration in the church. Even the narrative scenes from the Bible and Apocrypha, although more pictorial than the triptychs, maintain this air of otherworldliness. After the 12th century, Byzantine ivories tend to become careless in execution, dull, and repetitious. More originality occurs in the Russian examples that continue the tradition.

Another group of ivories are of Muslim origin. They include drinking horns (oliphants), usually with hunting scenes and animals set in scrolls, and a group of caskets, carved for the caliphs of Córdoba in the 10th century. Other later caskets seem to have been done in Sicily by Arab carvers.

Carolingian and Romanesque.—In the West from 800 to about 1150 A.D., the monasteries of the Rhineland and northern France developed "schools" of diverging styles. Most are imitative either of early Christian ivories, such as the previously mentioned Bodleian cover, or of East Christian and Byzantine models. An example of the latter is the Lorsch cover in Rome (Vatican), obviously inspired by a 6th century ivory such as the Ravenna chair; curiously enough the lower panel is carved from part of a consular diptych (other examples of "palimpsests," where old carv-

ings are reused, are fairly frequent). More distinctive are the ivories based upon manuscripts, carved in a dynamic linear style. A plaque set in the covers of a psalter of Emperor Charles the Bald (823–877) in Munich (Staatsbibliothek) with an elaborate Crucifixion and Marys at the Tomb (now a three-storied structure), is based upon the pen-and-ink drawings of the Utrecht Psalter (School of Reims); and a panel in the Civic Museum, Zurich, Switzerland, shows an illustration of Psalm 26 which is a literal translation in ivory of the same scene in the Utrecht Psalter.

Deane Dickason from Ewing Galloway

One of India's many artists in ivory at work on an intricate statuette of an elephant.

The German cities of Cologne and Metz seem to have been the chief centers of carving in the 11th and 12th centuries. The English preferred morse and whalebone as their material, but a rare instance of the use of elephant ivory occurs in the head of a pastoral staff in the Victoria and Albert Museum (11th century), which shows the ingenuity displayed by the carver in adapting the figures to the shape of the object. The only secular ivories are those of checker and chessmen. An important group of chessmen, of walrus ivory, comes from the island of Lewis, Scotland. The ivory knight (Allen Memorial Art Museum, Oberlin College, Ohio), probably French work of the late 12th century, shows amazing skill in the way the human and animal (horse and dragon) forms have been combined by the artist.

Gothic.—In the 13th and 14th centuries, an age dominated by the cathedral, ivory carving became a minor art. The elaborate architectural frames of diptychs, triptychs, polyptychs (more than three leaves), and small retables, and the graceful, elegant style of the figures in relief or in the round, reflect the influence of the

The American Museum of Natural History

Chinese puzzle ball in ivory. It consists of nine open working balls, one within the other.

dominant art of monumental sculpture in stone. France, and probably Paris, was the center of the art. The statuettes of the period are even finer than the many reliefs that can be seen in various museums, including elaborate portable shrines usually dedicated to the Virgin. To the late 13th century belong two fine groups in the Louvre, of the coronation of the Virgin and the descent from the Cross. Particularly popular are figures of the Madonna, including 20 in the Metropolitan Museum of Art (New York City), the majority from the 14th century. They show Mary either seated with the child in her lap or standing with the baby held high on the left arm. In these statuettes, as in their cathedral counterparts, the hip is outthrust, and the body, enveloped in flowing drapery, takes a graceful curve admirably suited to the curve of the tusk from which they are carved. The hieratic Mary of the Byzantine and Romanesque periods becomes humanized and sometimes even flippant as she smiles at her babe. More reverent than the typical French type, although based upon it, is the statuette in the Cathedral of Pisa in Italy, by Giovanni Pisano (1245-1314). Other religious objects of ivory include croziers, liturgical combs, *flabella* (fans), and *situlae* (holy-water buckets). The most important secular objects are the mirror cases, sometimes showing an elopement (perhaps Lancelot and Guinevere) as in examples in Liverpool (Civic Museum) and New York (The Metropolitan Museum of Art).

Renaissance, Baroque, and Later Periods.—The Italian Renaissance showed little interest in ivory carving, dominated as it was by the major arts of architecture, sculpture, and painting. In the 17th century the Italian baroque sculptor, Alessandro Algardi (1595 or 1602-1654) did some work in ivory, mostly crucifixes, but is better known for his monumental sculpture. The

reputation of his Flemish contemporary Francois Duquesnoy (Il Fiammingo, 1594-1643), who lived in Rome from 1618 until his death, rests largely upon his small sculptures in ivory, bronze, and terra cotta. All manner of statuettes and reliefs with mythological and religious subjects were produced in his studio, so perfectly executed that collectors considered them equal to the works of antiquity. Outstanding are his reliefs of *putti* (cupids), which show the influence of the paintings of Titian and Correggio; his ability to imbue the child form with life and animation and his rendering of delicate nuances and vibrant surfaces in these carvings strongly affected all later representations of children. As the center of ivory carving shifted from Italy to Flanders and Germany, the influence of Il Fiammingo's work appears in the many tankards decorated with bacchanalian scenes, which also owe much to the art of the Flemish painter Peter Paul Rubens, as in the case of the ivories attributed to Lucas Faydherbe (1617-1697), a pupil of Rubens.

In Germany a number of ivory sculptors are known by name. Among them are: Christoph Angermair (d. 1632), who specialized in coin cabinets; Ignaz Elhafen of Nürnberg (fl. about 1650); the Swabians, J. Michael Maucher and Leonhard Kern (17th century), and the Viennese sculptor Mathias Rauchmiller (1645-1686). Most of their work is heavy, ornate, and often lacking in good taste. There is also a plethora of statuettes and reliefs of ancient gods and goddesses, mostly nude, derived from the antique or from manneristic sculptors such as Giovanni da Bologna (1529-1608). The technique of turning ivory on a lathe became popular in Germany in the late 17th and 18th centuries. Johann Martin Teuber of Regensburg wrote a treatise on the subject, and the Zick family of Nürnberg was famous for its production in this field.

In France David Le Marchand (d. 1726) and Jean Cavalier (fl. 1680-1707) specialized in portrait medallions of ivory. As early as the 17th century, Dieppe had a factory that turned out religious objects, such as crucifixes, and continues to produce objects of mediocre quality to this day. Religious objects carved in Belgium, Spain, Italy, and Portugal in the late 19th and 20th centuries have little artistic merit, and the same is true of most carving today.

Orient.—In China ivory was prized next only to jade as a material suitable for fine carving at least as early as the 11th century B.C., in the late Shang dynasty (1523-1027 B.C.), and in the Chou period (1027-256 B.C.) it was used for decorating chariots and furniture, for ritualistic and ceremonial purposes, and even for chopsticks. So great was the demand that the elephant herds which roamed north China were depleted by the 6th century B.C., and ivory had to be imported from Siam, Burma, India, and even Africa. Always prized by the cultured classes, ivory carving was intimately connected with the imperial household as early as the Sung dynasty (960-1279 A.D.), when a special bureau for ivory carvers was established in 1263. In 1680 the Ch'ing emperor, K'ang-hsi, included ivory carving among the ateliers he established for various crafts in the palace precincts and sent for Cantonese workers, famed for their skill in carving intricate patterns and ingenious objects such as the "devil's work balls," consisting of concentric spheres carved one within the other. These are still made today

for the Western market and often have as many as 20 or more distinct balls, the outer being only 4 or 5 inches in diameter.

Except for ivories found in excavations of Shang and Chou sites, characterized by angular geometric designs with the spiral a favorite, most of our knowledge of early carving is derived from written sources. Few extant examples can be dated before the Ming (1368-1644) and Ch'ing (1644-1912) dynasties. Ming carvings of statuettes, particularly of old men (deities, philosophers, scholars), who were preferred as subjects to younger persons, are noteworthy for their mellowness and simplicity and the realization to the full of the beauty of grain and curve of the material. They are always carved out of a single piece of ivory with no added arms or legs. In quality the best of these are equaled only by the finest Byzantine and Gothic carvings. In the Ch'ing dynasty the use of ivory became more widespread; it was employed for a multitude of objects such as fans, screens, elaborate models of palaces and pagodas, toilet articles, and game pieces. Much Ch'ing work is extraordinarily delicate and technically near perfection, but lacks the harmonious beauty of the best Ming pieces.

The earliest ivories of Japan go back to the 8th century A.D. (Imperial Collection, Nara), when a technique known as *bachiru* was practiced, combining stained ivory with unstained designs, which were cut into it (mostly plectra, scabbards, combs, and the like). There is then a gap of about 1,000 years before anything more is known about the art. In the 18th century Yoshimura Shuzan of Osaka introduced or popularized the carving of netsukes in ivory; these ornamental buttons, used to secure cords that are attached to such objects as pipes, sweetmeat or medicine cases, and purses, had formerly been made of wood. It is a genre art of immense popular appeal, with realistic depictions of animal and human forms carved singly or in a variety of combinations. Shuzan, who worked in the early 18th century, was followed by a number of artists who specialized in netsukes and signed their names to them, each tending to concentrate on a particular kind of subject. One preferred cows and oxen, another carved palaces and landscapes in half-opened shells, and a third liked to represent jumping frogs as well as insects and other animals. An example of the extraordinary skill in minute carving exhibited by these artists of the Tokugawa period (1615-1867) is the work of one Nakayama Yamotome of Edo (modern Tokyo), who carved the portraits of 36 famous poets on a single small piece of ivory. A veritable miniature world, carved with infinite skill and patience, is revealed by these carvings.

The local demand for netsukes ceased at the end of the Tokugawa period in 1867, but the opening of Japan to the Western World led to a great demand for netsukes and other objects such as tea caddies, scoops, plectra, and other ornamental pieces. Skilled carving in ivory is done to the present day in Japan, although the product has been commercialized by foreign demand.

Eskimo Carvings.—Although the North American Indian made use of the bones, horns, and teeth of animals (such as bear, beaver, elk) for both useful and ornamental purposes, the craft of working bone and ivory became an art only in the Arctic and sub-Arctic regions of Alaska, northern Canada, and eastward to Greenland and Labrador. Making use of the materials available here but

not further south—the ivory of the narwhal, of the elephant and mammoth (in fossil form) and especially the morse ivory of the walrus—the ancestors of the modern Alaskan Eskimo developed a high degree of skill in engraving designs on such useful objects as harpoon heads, spear shafts, wrist guards and handles for knives, and boxes. The oldest culture is that of the Bering Sea, which apparently extended from St. Lawrence Island, south of Bering Strait, to Point Barrow on the Arctic Ocean and perhaps as far west as the Kolyma River in eastern Siberia, and may be 1,500 years old or more. Characteristic of this art is the freehand rendering of concentric circles with indented centers, curved and straight lines, with spurs attached both to the circles and curved lines. It is a curvilinear art, essentially abstract, with little relation to natural forms, although the indented center of the circle may resemble an eye (particularly when inset with a raised Balen disk), and the objects themselves may take the form of an animal (for example, an ivory seal, 5½ inches long, in the United States National Museum, Washington, D.C.). Even more remarkable than the graceful, flowing character of the incised lines is the uncanny ability of the artist to adapt the designs to the shape of the object. The material is almost always morse ivory, which ranges in color from cream through brown to a dark greenish black, the discoloration being due to long burial in the frozen soil. A masterpiece of this early art is a curious object from Point Hope, Alaska, also in the United States National Museum, consisting of two beautifully carved symmetrical wings and a central body engraved with the usual concentric circles with deep indented centers and other curved and straight lines harmonizing with the shape; the object, 8¼ inches in length, may have been a ceremonial piece to be used in whaling.

A transitional stage between the curvilinear art of the old Bering Sea culture and that of the modern Eskimo, with its heavy conventionalization of natural forms and pictographs, is represented by artifacts found on the tiny Punuk Islands, near St. Lawrence Island, in 1928. They are engraved with dotted concentric circles as before, but these objects are mechanically perfect, indicating the use of a two-pointed metal compass, and cannot therefore be dated before the introduction of European metal via Siberia following the arrival of the Russians in the second half of the 18th century. Straight lines and Y-shaped figures also appear; the incisions are of uniform depth without the subtle variations of the older culture. From the Punuk Islands comes a female figure, 4¾ inches in height, now in the United States National Museum, with a long torso, prominent abdomen, pendant breasts, and short arms and legs, which contrasts sharply with the stiff, conventional dolls of the modern Alaskan Eskimo but recalls similar fertility symbols from Paleolithic Europe.

The Thule culture of northern Canada, Baffin Island, and Greenland seems to be derived from the much older Bering Sea culture, suggesting an eastward migration at some remote time, but the designs on the comparatively few decorated harpoon heads and other objects are much more closely related to the Punuk Islands finds and to modern Eskimo work. Geometric lines, dots, and Y-shaped figures appear, but the circle is absent. We also find the beginnings of crudely drawn but realistic graved representations of animals and

other objects, which lead directly to modern Eskimo art.

Modern Eskimo carving, although often quite skillful, is definitely inferior artistically to the older specimens. Unlike the curvilinear style of the old Bering Sea culture, both engraved designs and shapes are basically representational and realistic. In addition to the objects mentioned, we now find dippers, needlecases, bow drills and drill stands, toggles, buttons, beads, and earrings, game pieces, dolls, and all kinds of household implements made of bone or ivory. Animal and human heads are common as well as geometric designs and pictographs engraved with metal tools. Masks from whalebone, in which the marrow is utilized for the exterior surface, also occur.

EDWARD CAPPS, JR.,
Professor of Fine Arts, Oberlin College.

IVORY COAST is a country of west central Africa. It is located on the bulge of Africa on the coast of the Gulf of Guinea, an inlet of the Atlantic Ocean. The country is roughly square in shape and nearly the size of the state of New Mexico. It is bounded on the west by Liberia and Guinea, on the north by Mali and Upper Volta, and on the east by Ghana.

The Ivory Coast is a rolling plateau rising gradually from the south to mountainous regions in the west and northwest. The climate is tropical, with heavy rainfall in the inland forest areas. The country is crossed by the Cavally, Sassandra, Bandama, and Comoé rivers.

Abidjan, the capital, is the principal port and the nation's center for air traffic. The only other sizable city is Bouaké, in the central part of the country.

The People.—The people of the Ivory Coast are mostly Negroes, organized in about 60 tribal groups. Over 60 percent follow tribal religions, 22 percent are Muslim, and 13 percent are Christian. The population includes about 20,000 Europeans, most of French descent.

Illiteracy is widespread among the people, but educational facilities are being expanded. Although only about 40 percent of the school-age children are enrolled in school, this is a higher percentage than in many other African nations. About 1,000 students attend the University of Abidjan.

The Economy.—Almost 90 percent of the people depend for their livelihood on agriculture, forestry, stock raising, or fishing. The principal food crops are yams, cassava, bananas, and taro. In cash crops, the Ivory Coast is the world's third-largest producer of coffee and fourth-largest producer of cocoa. Investments have been directed at the development of other cash crops, mainly cotton and rubber. The lumber industry produces mahogany and other woods for export.

Food processing and palm-oil extraction are the country's principal manufacturing industries. Textile and light-metal industries are developing. Since 1960, scientific mining techniques have increased the production of diamonds and manganese. Industrial growth is hindered, however, by inadequate transportation facilities. Most goods

are still transported by water, although increased funds have been allocated for road improvement programs since 1960.

Republic of the Ivory Coast Form of government: Republic. Area: 127,520 square miles. Population (1962): 3,500,000. Capital: Abidjan, pop. (1962) 185,000. Official language: French. Gross national product (1962): \$520,000,000. Per capita income (1962): \$160. Chief exports (1962): coffee, 142,000 tons; cocoa, 101,000 tons; wood, 915,000 tons. Value of trade (1962): exports, \$194,000,000; imports, \$157,000,000.
--

France takes about 50 percent of all exports from the Ivory Coast, and provides about 70 percent of all imports, chiefly food and machinery.

Government.—The government of the Republic of the Ivory Coast was established by the constitution of 1960. The constitution provides for a strong president elected for a five-year term. He holds exclusive executive power, appoints a cabinet which is responsible to him, and may also participate in legislative activities. The legislature is the 70-member National Assembly, elected for a five-year term by universal adult suffrage. All deputies are members of the Democratic Union of the Ivory Coast.

History.—In the 1400's, French sailors began to trade in ivory in the area. In 1637, French missionaries landed at Assinié, and a permanent mission was established there in 1687. The region of Grand-Bassam in the southeast became a French protectorate by a treaty signed in 1842. Later treaties extended the area of French rule and set up permanent boundaries. In 1893 a French governor was appointed, and in 1895 the Ivory Coast became a part of French West Africa.

The Ivory Coast became an autonomous republic in the French Community on Dec. 4, 1958. On Aug. 7, 1960, it was proclaimed an independent republic, outside the Community. Since independence the Ivory Coast, under president Félix Houphouët-Boigny, has maintained close economic and political ties with France.

IVY, i'vī, the name applied to various plants, especially the genus *Hedera*, in the ginseng family, Araliaceae. Of these *Hedera helix*, the English ivy, native of Europe, is best known and most commonly cultivated. *Hedera helix* is an evergreen; in the juvenile state it is climbing, with three- to five-lobed, dark green, leathery leaves, as much as four inches long but usually smaller, often with light-colored veins, and with stems bearing aerial rootlets. The adult form is more shrubby, has entire leaves, lacks aerial roots, and bears small greenish flowers in umbels. The flowers, which appear in autumn, have five sepals, five petals, five stamens, and a five-celled ovary which matures the following spring into a black berry. Like other plants long in cultivation, *H. helix* exists in very numerous varieties; many of these have variegated leaves, marked with white, yellow, or dark colors. English ivy is extensively used as an ornamental on walls, in gardens, in hanging baskets, in greenhouses, and as a ground-cover plant in shaded areas. Most of the varieties do not withstand severe cold. Irish ivy, *H. helix* var. *hibernica*, a widely grown variety, has larger, thinner leaves, somewhat lighter in color.

In the Algerian ivy, *H. canariensis*, the stems and leafstalks are red and the leaves and fruits are larger than in *H. helix*. This species is native of northwestern Africa, Madeira, the Canary Islands, and the Azores. When adult plants of this species are sprayed with gibberellic acid, they revert to the juvenile form, with lobed leaves and aerial roots. *Hedera colchica*, of southeastern Europe and Asia Minor, has green twigs and relatively large leaves.

Many other plants, not closely related to *Hedera*, are also called ivy. Among these are poison ivy (q.v.), *Rhus radicans*; Boston or Japanese ivy, *Parthenocissus tricuspidata*, native of China and Japan, with three-lobed or three-parted leaves turning brilliant red in autumn, the most commonly planted vine on walls and buildings in North America; ivy bush, the mountain laurel (q.v.), *Kalmia latifolia*, of eastern North America; ground ivy (q.v.), *Glechoma hederacea*, a creeping plant with reniform, crenulate leaves and small, purplish-blue bilabiate flowers in early spring, native of Europe and Asia but widely naturalized in North America; Kenilworth ivy (q.v.), *Cymbalaria muralis*, a trailing European plant with small blue flowers marked with yellow; and German ivy (q.v.) *Senecio mikanioides*, a twining South African composite with small heads of yellow flowers.

EDWIN B. MATZKE.

IVY POISONING, a contact dermatitis which occurs when there is a direct exposure between the skin of an individual and a member of the *Rhus* genus of plants: poison ivy, poison oak, or sumac. The skin lesion consists of crops of blisters accompanied by redness, burning, and intense itching. The severity of the rash varies with the amount of contact and the individual sensitivity of the patient. The oleoresin or antigen of the poison ivy plant rubs off on the clothing, the fur of animals, and even the skin of the affected individual. Prompt cleansing with soap and water helps eliminate the source of further contamination. However, the watery fluid in the blisters is a serous exudate; it cannot spread the rash, nor can such fluid carry ivy poisoning from one person to another. The skin lesions appear first on exposed parts, hands, feet, or face, and continue to appear from several hours to several days after exposure.

The antigen or the chemical causing the reaction in ivy poisoning has been chemically synthesized and is known as 3 pentadecylcatechol. Various vaccines have been prepared from the poison ivy antigen. These are best given by the intramuscular rather than the oral route and should be given in the late winter before the plants begin to leaf out. Administration of the vaccine to acute cases of ivy poisoning is ill advised and dangerous.

Many treatment agents have been used for poison ivy cases. The first principle involves strict cleanliness and avoidance of further contact. Various drying ointments, lotions (calamine and calamine with phenol) and Lassar's paste (zinc oxide) are used for the less severe cases; wet compress dressings (Burow's solution) for cases where the skin blisters break down and fissure. Since the early 1950's steroid therapy, both locally and orally, has been extremely helpful. Cortisone, hydrocortisone, prednisone, and prednisolone promptly control itching and block further spread. Secondary skin infection is rare

but should be watched for, and appropriate antibiotic therapy begun.

REAUMUR S. DONNALLY, M.D.,
Staff of Washington Hospital Center.

IWO JIMA, ēwō jēmā, a Western Pacific island, one of the Volcano Islands (q.v.) annexed by Japan in 1891, 760 miles south of Tokyo. It is 5 miles long and 2 miles wide, the area being 8 square miles; the population normally numbers about 1,000. During World War II it was captured by United States forces after heavy fighting. Marines landed on Feb. 19, 1945, attacked Mount Suribachi, a volcano on the south, and raised the American flag on its summit on February 23. Conquest of Iwo Jima was completed by March 16. Marine casualties totaled 19,938, of whom 4,189 were killed; and Japanese dead were estimated to number 21,000. After the war the United States retained control of the island for security purposes.

IXIA, ik'sī-ā, a genus of some 25 species and numerous cultivated varieties of South African plants, one from tropical Africa, in the iris family, Iridaceae. They are propagated by corms, from which the grasslike leaves, often a foot or more long, and the simple or branched stems, one to two feet high, develop. The very attractive spring-blooming flowers, in spikes or racemes, are one to two inches in width, at first erect, later nodding. They have six perianth parts and three stamens and are delicately and variously colored—white, yellow, orange, pink, red, lilac, and green. They can be grown in pots and cold frames, but in northern United States and in colder regions they require protection against frost if planted outdoors.

EDWIN B. MATZKE.

IXION, ik-sī'ōn, in Greek mythology, king of the Lapithae, in Thessaly, son of Phlegyas. He married Dia, daughter of Deioneus. He murdered his father-in-law, and as punishment, became insane until Zeus cured him and permitted him to reside in Olympus. He became enamored of Hera, and attempted to seduce her. Zeus made a cloud in the shape of Hera, and carried it to the place where Ixion had appointed to meet her. Ixion was caught in the snare, and from his embrace with the cloud were born the Centaurs (q.v.). Zeus banished him from heaven; struck him with his thunder, and ordered him tied to a winged or fiery wheel which was to revolve eternally, according to some in the air, and to others in the underworld.

IXTLILXOCHITL, ish-tlil-shō'chit-l, **Fernando de Alva Cortes**, Mexican historian: b. Texcoco, 1568?; d. ?1648. Through his mother, he was descended from the ancient kings of Texcoco, and in 1602 became heir to the family's titles and possessions. The Spanish viceroy, for whom he was interpreter, commissioned him to write histories of the ancient Mexican peoples, of whom he possessed great knowledge. His works remained unknown until their importance was revealed by Francisco Javier Clavijero (Clavijero), and afterward by Baron Alexander von Humboldt. They were deposited in the library of the Jesuits in Mexico. The series of histories consisted of 13 books or relations, many

of which were repetitions of material in earlier volumes, and covered the period from the most ancient times to the destruction of the Mexican Empire. His history of the Chichimecs was first published in Paris in 1840.

IYEYASU. See IYASU.

IZABAL, ē-sā-väl', department, Guatemala. It is in the eastern part of the country. Its capital, chief port, and rail terminus is Puerto Barrios on the Gulf of Honduras. The region produces timber as well as bananas, coconuts, and other fruit. Lake Izabal, formerly called Golfo Dulce, is a body of fresh water about 30 miles long and 15 miles wide, fed by the Río Dulce, and draining through this river and a smaller lake into the Caribbean. In Spanish colonial times, the village of Izabal, on the south shore of the lake, served as a center of trade with the Indians of the interior, but it has since been nearly abandoned. The climate is tropical and humid. Pop. (1950) 55,635.

IZALCO, ē-säl'kō, volcano in the western part of El Salvador. One of the most active in the world, it has been called the Lighthouse of the Pacific. It is believed to have been formed in 1770 by a sudden eruption. Its height, long subject to dispute, is apparently somewhat less than 8,000 feet, but the mountain continues to grow as fresh volcanic matter is disgorged.

IZARD, iz'erd, Ralph, American statesman: b. near Charleston, S.C., 1742; d. there, May 30, 1804. Inheriting a considerable fortune, he was sent to school in England, and, after some years in South Carolina, settled in London (1771). He attempted unsuccessfully to persuade the British ministry to alter its policy in regard to the American colonies, and in 1776 moved to Paris, where, acting for the Continental Congress, he helped to procure ships of war for the American cause. He returned to America in 1780, entered the Continental Congress as delegate from South Carolina, and later became his state's first United States senator (1789).

His son, **GEORGE IZARD** (1776-1828), attained the rank of major general during the War of 1812, at one time holding chief command of American forces on the northwestern frontier. He became governor of the Arkansas Territory in 1825.

IZHEVSK, ē-zhěfsk', city, USSR. It is situated in the western foothills of the Urals, 165 miles east-northeast of Kazan and about 600 miles east of Moscow, and is on the Izh River, a tributary of the Kama. Under the Soviet regime, Izhevsk has been the administrative capital of the Udmurt Autonomous Soviet Socialist Republic, a political division of the Russian Soviet Federated Socialist Republic inhabited by the Udmurt people, an ethnic group of Finno-Ugric stock. The city was founded in 1760 as one of the earliest ironworking centers in the Urals. In the 19th century it acquired fame as a producer of rifles and other small arms.

Izhevsk has since become industrially important for its production of machinery, including machine tools and agricultural implements. The old arms plant was reconstructed after the Bolshevik Revolution and was divided in 1939 into a machine-building plant and a separate steel

plant. In 1933 the Soviet Union's first motorcycle factory was established here. The city is also an agricultural processing center for grain and livestock and has a woodworking industry fed by local timber production. Pop. (1956 est.) 252,000.

IZMAIL, iz-mä-ēl', city, USSR. It is in the Ukrainian SSR in southernmost Bessarabia, 120 miles southwest of Odessa, in Odessa Oblast (province). It is a port on the northern arm of the Danube River delta, which leads to the Black Sea and forms the Rumanian border of the Soviet Union. Industries include a ship-repair yard and fisheries, and the port serves as the headquarters of the Soviet Danube River naval flotilla. Izmail lies among extensive vineyards and orchards whose products are processed in the city as wine, grape juice, and canned fruit.

A Turkish fortress after the 16th century, Izmail was seized and lost repeatedly by the Russians in their wars against the Turks. The most notable assault was that of 1790, when the fort, garrisoned by 35,000 Turks, was stormed and taken by Russian troops under Aleksandr Vasil'yevich Suvorov. Izmail subsequently shared the fate of southern Bessarabia, passing to Russia in 1809, back to Turkey in 1856, and to Russia again in 1878. From 1918 to 1940 the city was in Rumania and was called Ismail. Its annexation by the Soviet Union in 1940 was confirmed in 1947, and it served for several years as the capital of Izmail Oblast, which was merged with Odessa Oblast in 1954. Pop. (1956 est.) 40,000.

IZMIR, iz-mir' (formerly SMYRNA, smür'-nä), seaport, Turkey; capital of the Vilayet (province) of Izmir. It is approximately 210 miles south-southwest of Istanbul and is situated on the west coast of Anatolia at the head of the Gulf of Izmir. The harbor is excellent and main rail lines bring to it goods from inland cities for export. Manufactures of Izmir include leather, tobacco, soap, dyes, and cotton textiles.

The original city, presumably antedating the colonization of Asia Minor by the Greeks, stood on the northeast side of the gulf. It passed from the Aeolian Greeks to the Ionians of Colophon about 688 B.C. After being captured by the Lydians in 627 B.C., it declined from its former prosperity. The old city was abandoned and a new one constructed on the present site, on the southeast shore of the gulf, shortly after the death in 323 B.C. of Alexander the Great, who is said to have inspired the project. Building was carried out on a grand scale, and the city soon became one of the most prosperous in the world. Smyrna believed itself to be the native city of Homer and its acropolis had a temple where the poet was honored as a god. The city was still prospering in Roman times. It was the home of an important early Christian community and the site of the labors and martyrdom of St. Polycarp.

From the 4th to the 15th century, the city was in the Byzantine Empire, with the exception of two periods when it was briefly held by the Seljuk Turks—once in the 11th century and once in the 14th century. From 1206 to 1261 it was in the Empire of Nicaea. In 1402, Tamerlane sacked the city and massacred the inhabitants. As a city of the Ottoman Empire from 1424 to 1919, Smyrna revived and became the chief port of Asia Minor. Occupied by Greek forces in 1919, it was returned to the Turks by the Treaty of Lausanne in 1923. Pop. (1950) 230,508.

Consulate General of Japan

JAPAN: Plantation in Shizuoka Prefecture, the nation's main tea-growing region.

J, the 10th letter in modern alphabets derived from Latin which have this symbol, but historically only a variety of *i*. It first came into use in scratched inscriptions (*graffiti* on walls or vases, written while the clay or plaster was still wet) as early as the 2d century A.D. Its phonetic value varies enormously. In German it is consonantal (*y*). Latin initial consonantal *i*, however, became a fricative (*j*, as in French *juge*), and the *j* symbol was attached to this sound, which also arose from other sources (French *jour*, Latin *diurnus*). In English it is initially an affricate (*dʒ*, as in *judge*). In Spanish the fricative or affricate has become *h*, strongly aspirated, and written *j* or (before *e* or *i*) *g*. Russian has *z*, written *ж*.

The name of the letter in German is *Iot*, taken from the Semitic name of the *i* symbol. French *ji* (the *ž* sound) was borrowed into English as *jay*. Nearly all modern English words that begin with *j* are loan words, such as *janissary* (Turkish) or *jūjitsu* (Japanese); many are of Romance (mostly French) origin, such as *jaundice*; a few are derived directly from Latin (*Jupiter*); *jurassic* is ultimately Celtic (Jura Mountains); *jūjube* comes from the Near East (through Greek).

The sound *dʒ* is variously written in English: *spinach*, *verdure*, *soldier*, *barge*, *gentle*, *suggest*. In *ldz*, *ndz*, only *lʒ*, *nʒ* are now heard, as in *indulge*, *singe*. Northern dialects in England still preserve *g* in *bridge* (*brig*, formerly *brigge*) and in *singe* have the nasal *ɓ* (Middle English *sengen*). The 18th century *j* in *soldier*, *educate*, and other words is now obsolete, and *ž* not *dʒ*, is heard in *leisure*, *pleasure*. Many authorities regard *j* (*dʒ*) as one phoneme. But although English has the contrast *ch* : *j* (*chain* : *Jane*), it has no initial clusters *sč-* or *dj-* as it has *sp-* and *dr-*. It is better, therefore, to consider the English *j* as a compound phoneme, made up of *d* plus *ž*.

See also ALPHABET.

JOSHUA WHATMOUGH.

JABALPUR. See JUBBULPORE.

JABBOK, jāb'ök (Ar. WADI ZERQA), river, Jordan, rising near Amman and flowing generally west for 80 miles to empty into the Jordan River about 20 miles north of the Dead Sea. In ancient Palestine it was a boundary line between the Amorite kingdoms and the land of Bashan. It was on the south bank of the Jabbok that Jacob wrestled with the angel (Genesis 32:22-32).

JABIRU, jāb'ī-rōō, a handsome stork (*Ephippiorhynchus senegalensis*), also called the saddle bill, of tropical Africa, ranging from Senegal and the Sudan south to Cape of Good Hope Province. It stands over four feet high, and is conspicuously black and white with a sharp, bright red bill about one foot long, encircled by a broad black band and covered at the base by a large bright yellow shield. The legs are black with bright red joints and feet. It inhabits swamps or the margins of rivers, and feeds, as do all storks, chiefly on small aquatic animals or large water insects. The jabiru is also the name applied to one of the New World storks (*Jabiru mycteria*), which ranges from Mexico to Argentina. It is one of the largest flying birds of the New World.

CHARLES VAURIE.

JABLONEC, yā'blō-něts (Ger. GABLONZ), a town, Czechoslovakia, in northern Bohemia, in the Sudeten Mountains, near the Polish border. Jablonec is situated six miles southeast of Liberec, on the upper Neisse River. It is a center of the Bohemian glass industry, specializing in beads, bangles, and artistic glass figures. The name of Jablonec has become identified with imitation jewelry made there. The glass industry developed after the Napoleonic Wars and long supplied an export trade to Africa and Asia. Jablonec also has textile mills (woolens and cotton goods). There are Gothic and 17th century churches and a museum with a large collection of Bohemian cut glass. The town, inhabited once by Sudeten Germans, was virtually depopulated when they were expelled by Czechoslovakia after World War II. Its population was replenished by Czechs, but remained under the prewar level. Pop. (1958 est. 26,000).

JABORANDI, jāb-ō-răn'dī, a common name for plants of the genus *Pilocarpus* in the rue family (Rutaceae), containing about 20 species of shrubs or small trees of tropical and subtropical America. Dried leaflets of various species of *Pilocarpus* were once official as the drug *pilocarpus* or *folia jaborandi*. Several alkaloids are derived from jaborandi leaves, principal among them being *pilocarpine*, used chiefly as a sudorific or myotic. The most important species of jaborandi are the Brazilian *P. microphyllus* and *P. jaborandi*. Less significant is *P. pennatifolius* of Brazil, Paraguay, and Argentina. These plants have compound leaves with several leaflets and greenish or deep rose flowers in elongate clusters.

JOHN W. THIERET.

JACAMAR, jāk'a-när, a bird of the family Galbulidae, which comprises 14 species inhabiting the American tropics from southern Mexico to Brazil. Their closest relatives are the puffbirds and toucans. The majority are the size of a starling, and all are very beautiful, usually glossy bronze green above, and cinnamon, brownish, or black below, with a white throat. They are found along the edge of the high forest, in sites that overlook grassy fields or meandering streams, and nest in a deep burrow excavated in a bank of earth. Jacamars are noted for being very stolid, perching for long periods very quietly on some favored post and sallying forth now and then after some flying insect.

CHARLES VAURIE.

JAÇANA, zhä-sä-nä', a group of birds (Jacanidae) related to the rails, and remarkable for the extraordinary length of their toes, which are further extended by long slender claws. There are four genera and about seven species of jaçana, most of which inhabit Africa, India, and Australia. The genus *Jacana* is American, and one Mexican species (*J. spinosa*) occasionally reaches Texas. The beak is ploverlike and the bend of the wing bears a stout and acute horny spur; the plumage is of a rich purplish brown with the wings green and black. The great spread of the toes enables these birds to walk with ease on the floating leaves of water lilies and similar plants, otherwise their habits are much like those of rails.

JACARANDA, jāk-ä-rän'dä, a genus of about 40 species of tropical American shrubs and trees of the bignonia family (Bignoniaceae). Several species are cultivated as ornamentals and a few yield useful timber. *Jacaranda acutifolia* is a popular flowering tree in Florida and southern California. *J. copaia*, the most widely distributed species, ranges from British Honduras south to Brazil. Its wood is called caroba and is used for matchsticks, boxes, coffins, interior finish, and general construction. Typically, members of *Jacaranda* have opposite, fernlike leaves with many small leaflets; showy, blue or violet, clustered flowers; and woody capsules containing winged seeds. Some species shed their foliage before coming into flower. The wood known as jacarandä or Brazilian rosewood is derived from *Dalbergia nigra*, a Brazilian tree of the legume family (Leguminosae).

JOHN W. THIERET.

JACCOUD, zhä-kōō', François Sigismond, French physician: b. Geneva, Switzerland, Nov. 20, 1830; d. Paris, France, April 27, 1913. He was educated in Geneva and Paris; became professor of pathology in Paris in 1876 and professor of clinical medicine there in 1883. In 1877 he was elected member of the Academy of Medicine and became perpetual secretary thereof. He made investigations of the causes of albuminuria; described prominence of the aorta in the region of the suprasternal notch as symptomatic of aortic dilatation; and was also known for his description of a type of fever in tuberculous meningitis, with irregular, slow pulse, called Jaccoud's dissociated fever. He wrote *De l'organisation des facultés de médecine en Allemagne* (1864); *Leçons de clinique médicale* (1867-1888); *Traité de pathologie interne*, 7th ed. (1883); and *Du froid comme cause de pneumonie* (1887). He was editor of

Nouveau dictionnaire de médecine et de chirurgie (1864-1886).

JACK, jāk, an apparatus for raising heavy bodies and for moving machinery. See HYDRAULIC CRANE.

JACK, or **JACK TREE**, a tropical tree (*Artocarpus integra*) of the mulberry family (Moraceae) that is related to the breadfruit tree and bears the large and well-known jack fruit. The tree is native to India but is planted throughout the tropics. Jack fruits are 1 to 3 feet long, 6 to 20 inches wide, pear- or barrel-shaped, and greenish-yellow to brownish when ripe. The skin is studded with sharp conical warts. The fruits, borne on the trunk and main branches (or in some varieties even on the roots), may weigh as much as 80 pounds. They contain a large number of seeds, each enclosed in a gelatinous sheath. When green, the fruit is used as a vegetable or made into pickles; when ripe, it is eaten fresh or preserved in syrup. The seeds are eaten after boiling or roasting. The tree produces a light brown wood used for furniture, brush backs, musical instruments, and turnery.

JOHN W. THIERET.

JACK AND JILL, the first words of an old nursery rhyme, of considerable folklore interest. Jill is a corruption of the French Julienne, once common in England under the form Gillian. It also appears in the legend of Saint Kilian (Cilian), where Geilana vindictively causes the good bishop's death. This incident of Jack and Jill is probably based on one of the moon myths of Scandinavia. The Norse peasant sees in the spots on the moon the two children rescued by the moon from their father, who had forced them to draw water all the day.

JACK AND THE BEANSTALK, an English nursery tale relating to the heroism of a boy. Its analogue occurs in many national folklore legends. It is supposed to represent in a figure the restoration to the earth of those fertilizing and elemental activities, which are necessary to human life. The harp is the wind, which drives the ships and turns the mills to grind the wheat. The bags of treasure are the raindrops that scatter wealth and plenty. The red hen is the sun that brings life to birth by its fostering heat. The story is enjoyed by young children, however, without reference to the symbolism, simply because of the narrative suspense.

JACK HORNER, the first words of an old nursery rhyme. The rhyme is said to be based on a historic fact. Horner was the messenger whom the abbot of Glastonbury sent to Henry VIII with the deeds of certain manors involved in the dissolution of monasteries. Horner obsequiously handed the parcel to the royal spoliator, but first of all managed to abstract the deeds of the manor of Wells, a "plum" indeed, and the abbot was afterward punished on the charge that he had withheld them.

JACK-IN-THE-PULPIT, or **INDIAN TURNIP**, a perennial herb (*Arisaema triphyl- lum*) of the arum family (see ARACEAE), so called from its spadix, which is upright, with the spathe surrounding and arching over it, suggesting a preacher in an old-fashioned pulpit

with a sounding board. It is common in the United States, east of the great plains, in damp shady woods, and is easily grown in moist garden soil. The spathe falls away in early summer. By late summer the berries which form a dense ovoid head become a brilliant, waxy scarlet. Its acrid tuber or corm is valued for its medicinal properties.

JACK RABBIT. See HARE.

JACK THE GIANT KILLER, the hero of an English nursery story, which reflects triumph of skill over strength and bulk such as makes the point of the story in David and Goliath, or Ulysses (Odysseus) and Polyphemus. The English form is based upon the legend that Saint Michael's Mount, in Cornwall, was once the fortress or castle of a giant, who was dislodged by the valor of an English knight. In adapting the story so as to claim the sympathies of children, the knight is made to take the shape of a child.

JACKAL, a small active wild dog or wolf of the warmer regions of the Old World, found in southeast Europe, Africa, Syria and southern Asia. The common jackal averages about 2 or 2½ feet in length and about 14 inches in height, with a bushy tail about 8 inches long. The eyes are small and the pupil is round. The general color of the body is a dirty yellow or brown, lighter on the throat and belly. Jackals inhabit holes and burrows whence they come forth in the evening to hunt in packs. Their cry consists of a series of prolonged howls, followed by shorter yelps, much like that of the American coyote. The jackal subsists largely upon carrion, often that left after the repast of the fiercer and larger Carnivora; but it also kills prey for itself, a pack hunting down antelopes, deer or other animals, besides getting much small fare, as mice, lizards, insects, and the like. They also eat certain kinds of vegetable food, and sometimes they do considerable damage to sugar and other plantations. The jackal is susceptible of being tamed, but its odor makes it by no means a desirable domestic animal. It is believed to be exceedingly cunning, and in many Eastern tales, especially among the people of India, plays exactly the same part as the fox does in those of Europe. It is probable that jackals have contributed frequently to the commingled stock represented in our domestic dogs, some of which betray very jackal-like points. They interbreed with domestic races.

The common jackal (*Canis aureus*) is the most widely distributed species; but another species, found mostly in eastern southern Africa, is the blackbacked jackal (*C. mesomelas*). This latter form has the back and end of the tail black, the other parts mostly red or yellowish-red. A third species of jackal found in South Africa is the canduc (*C. adustus*), marked by a light stripe on the sides.

JACKASS KINGFISHER, or **LAUGHING JACKASS**, the name of a large inland kingfisher (*Dacelo gigas*) of Australia, given by the colonists in allusion to its loud, hoarse cry. It is about 17 inches long, brown in general color, does not frequent water or catch fish, but lives on insects, small reptiles, etc., and lays its eggs in a hole in a tree.

JACKDAW, a small, black European crow (*Corvus monedula*), with black legs and feet and grayish neck. They inhabit towers, spires and like elevated situations, and even in towns and populous cities are present and breed freely. The nests and eggs are like those of other crows (q.v.) which they resemble in general habits.

JACKS, jåks, **Lawrence Pearsall**, English educator and editor: b. Nottingham 1860; d. Feb. 23, 1949. He was educated at University School, Nottingham, University of London, Manchester College, Oxford, Göttingen University, and Harvard University. He was professor of philosophy in Manchester College, Oxford, dean of the college and warden of residence, 1903-1915, and principal, 1915-1931. He was editor of the *Hibbert Journal* from its foundation in 1902 until he retired in 1947. He is the author of *Mad Shepherds and other Human Studies* (1910); *From the Human End* (1916); *Philosophers in Trouble* (1916); *Life and Letters of Stopford Brooke*, 2 vols. (1917); *Heroes of Smokeover* (1926); *Constructive Citizenship* (1927); *My Neighbour the Universe* (1928); *The Inner Sentinel* (1930); *The Education of the Whole Man* (1931); *Education through Recreation* (1932); *My American Friends* (1933); *Elemental Religion* (1934); *Revolt against Mechanism* (1934); *Co-operation or Coercion* (1938); *The Stolen Sword* (1938); *The Last Legend of Smokeover* (1939); *Construction Now* (1940); and *The Confession of an Octogenarian* (1942).

JACKSNIPE, also called grass or meadow snipe, which is in reality a sandpiper, named in books the pectoral sandpiper (*Tringa maculata*). The perversion of names is due to its somewhat gamelike habits of lying to a dog and flushing correctly from the grass, like a true snipe which render it an attractive object of pursuit; besides which, in the fall it becomes very fat, and it is then excellent eating.

The English jacksnipe is a true snipe (*Limnocyrtus gallinula*) of very small size, and therefore also known as "half-snipe." See also SANDPIPERS.

JACKSON, Abraham Valentine Williams, American Indo-Iranian scholar: b. New York, Feb. 9, 1862; d. there, Aug. 8, 1937. Graduated from Columbia in 1883, he was fellow in letters there (1883-1886), and, after study at Halle (1887-1889), instructor in Anglo-Saxon and the Iranian languages (1889-1891), and adjunct professor of English language and literature (1891-1895). From 1895-1935 he was professor of Indo-Iranian languages and public lecturer at Columbia. By way of recognition of the instruction given by him in their ancient books, the Parsees made to the Columbia library the gift of an important manuscript collection of Zoroastrian works. He appeared also as a public lecturer, became one of the directors of the American Oriental Society, and in addition to numerous contributions to the *Journal* of that society and other learned periodicals, wrote *A Hymn of Zoroaster*, *Yasna XXXI* (1888); *An Avestan Grammar* (1892); *An Avestan Reader* (1893); *Zoroaster, the Prophet of Ancient Iran* (1899); *Persia, Past and Present* (1906); *From Constantinople to the Home of Omar Khayyam* (1911); with A. Yohannan the *Descriptive Cat-*

ologue (1914) of the collection of Persian and other manuscripts presented to The Metropolitan Museum of Art (New York City) by Alexander S. Cochran.

JACKSON, Alexander Young, Canadian painter: b. Montreal, Quebec, Canada, Oct. 3, 1882. Educated in the Montreal public schools, he worked for a time in the lithographic business and studied art in Montreal, Chicago, and at the Julien Academy in Paris. In World War I he served with the Canadian infantry and later as official artist for Canadian war memorials. About 1919 he joined the "Group of Seven," Canadian painters who found inspiration in the wild Canadian northland for the development of a national art. Jackson is noted for his Canadian landscapes, especially from northern Ontario and Quebec, some as far north as Ellesmere Island. Among them are *Night*, *Georgian Bay* and *Early Spring, Quebec*. See also CANADA—31. *Art and Architecture* (Painting).

JACKSON, Andrew, 7th president of the United States: b. Waxhaw settlement, S.C., March 15, 1767; d. The Hermitage, near Nashville, Tenn., June 8, 1845. His parents were

Brown Brothers

Andrew Jackson.

Scotch-Irish immigrants who had come to the Waxhaw settlement with two elder sons to try their fortune. An untimely accident caused the death of Jackson's father about two weeks before Andrew's birth, and through the first 14 years of his life he was reared by his mother, who was given asylum in the home of her brother-in-law.

During this period Jackson became indoctrinated with the virtues and vices of the frontier; he was strong willed, independent, and courageous, and was also noted as a bully, drinker, and swearer. He had little opportunity for formal schooling and no love for it.

The Revolutionary War was a turning point in Jackson's life. In 1779 his eldest brother died in the war. Jackson volunteered at the age of 13, with his surviving brother, and both were captured by the enemy. In the course of his captivity Jackson refused to shine the boots of one of his captors and received for his impertinence a saber slash, leaving a mark which he bore the remainder of his life. While prisoners, the brothers contracted smallpox. On their mother's plea, their illness and youth won them a release, but Andrew's brother died of the disease. A few months later his mother died while serving as a volunteer nurse for the American prisoners held by the British. Jackson was left with a dislike for the British which was to influence him for the remainder of his life.

Early Career.—The experiences which Jackson had undergone brought him to an early maturity. At 14 he had ceased to be dependent upon his uncle, and he tried his hand unsuccessfully at the frontier trades of saddle making and school-teaching. Subsequently he visited Charleston, making some acquaintances in aristocratic social circles, establishing a reputation as a dandy and a gambler, and acquiring an interest in law. After almost three years of study in the law offices of Spruce Macay in Salisbury, N.C., Jackson was admitted to the bar in 1787 and began to practice in Martinsville. He was rescued from the monotonous, hand-to-mouth existence of an unimportant frontier lawyer by the exciting prospects of a visit to the infant town of Nashville, in the Western District of North Carolina (now Tennessee).

Jackson arrived in Nashville in 1788 and quickly found his services in demand. His courage, character, and strong passions were attributes as valuable to the young lawyer as his meager legal training. Jackson developed a profitable practice, and in 1789 was officially appointed prosecuting attorney for the district. His popularity and influence increased rapidly.

At this time Jackson became acquainted with Rachel Donelson Robards, who was unhappily married to Lewis Robards. The storms of this marriage contract had created an unhappy situation which Jackson's appearance did nothing to calm. Rachel finally fled her mother's Nashville home to find a haven in the Natchez country. When news reached Nashville of an alleged divorce granted to Robards by the Virginia legislature, Jackson journeyed to the Natchez country, with the Donelsons' blessing, to make Rachel his wife. The subsequent marriage in August 1791 was deemed illegal when it was learned that Robards had not secured a divorce. Therefore a second ceremony was performed in 1794 after the formal divorce had been granted. The legal niceties had been observed, but the slanders which derived from this unhappy incident were to involve Jackson in many controversies.

Jackson was a member of the Tennessee constitutional convention (1796) and the first representative of the state to Congress (1796-1797). He was then elected to fill an unexpired term in the United States Senate, but gave up this post in 1798 to devote himself to his private affairs.

However, Jackson was thwarted in his desire to return to private life by his election to the Superior Court, at that time the highest tribunal in the state (1798). He did not seek the post, but accepted it on the basis of his favorite maxim, as paraphrased by James Parton, "that the citizens of a free commonwealth should never seek and never decline public duty." The six years he spent as a judge seem to have been among the most pleasant of his life. There are no records of his decisions, but according to Parton, "Tradition reports that he maintained the dignity and authority of the bench, . . . and that his decisions were short, untechnical, unlearned, sometime ungrammatical, and generally right."

Jackson's public services constituted an almost continuous stumbling block for him in establishing his economic independence. In 1804 he resigned from the bench in order to recoup his fortunes. At about this time he was forced to sell his home at Hunter's Hill to pay his debtors, and contented himself with a less pretentious establishment at The Hermitage, a few miles northeast of Nashville. A foray into the mercantile business proved unprofitable, and a few years later the firm closed its doors. Jackson then devoted himself to his plantation, frontier land deals, horse breeding, and horse racing.

One of the most tragic incidents in Jackson's career was his feud with Charles Dickinson, a lawyer trained at the College of William and Mary in Virginia. Dickinson had established a good professional reputation in Nashville. He first aroused Jackson's ire when, in a drunken brawl, he made some personal remarks about Mrs. Jackson. Although Dickinson apologized, relations between the two men remained cool. Dickinson was one of the chief losers to Jackson in betting on horse races. Subsequently false rumors were set afloat which led in 1806 to a duel between the two men. In the duel Jackson killed his opponent and suffered a wound that was to plague him for the remainder of his life. The affair was proper under the frontier code, but it contributed to Jackson's reputation for quarrelsomeness and vindictiveness and failed to quiet the ugly stories that marred his life.

War of 1812.—In 1802, Jackson had been chosen for the coveted office of major general of the Tennessee militia. Early in the War of 1812 he was ordered to lead the militia to the support of Gen. James Wilkinson in New Orleans for a projected campaign against West Florida. Wilkinson did not want Jackson in his command, but he did want the Tennessee militia. He therefore contrived to have the federal government order the disbandment of Jackson's force at Natchez, where it was encamped, hoping the penniless soldiers would be forced to enlist in his army. Jackson refused to disband the troops and pledged his personal fortune to provide for their return to Tennessee. His concern for the welfare of the militiamen and his readiness to share their privations won for him the sobriquet "Old Hickory."

A few months later (August 1813) the massacre by Creek Indians at Fort Mims in the Mississippi Territory resulted in orders to General Jackson to punish the Creeks. In spite of almost incredible hardships, an incompetent and inefficient commissary, and the constant threat of mutiny and desertion, Jackson crushed the Creeks in a brilliant campaign climaxed by the victory at Horseshoe Bend on March 27, 1814. This campaign established Jackson's military reputation,

and he was made a major general in the United States Army with command of the 7th southwestern Military District.

The British plan, which unfolded in the late fall of 1814, was to gain control of the lower Mississippi River valley. Jackson was soon convinced that the major theater of action would be New Orleans, and he concentrated the available troops in that area. After three preliminary skirmishes, the British launched an attack against Jackson's defenses on Jan. 8, 1815, not knowing that a peace treaty had already been signed. The British loss was more than 2,000 while the Americans lost fewer than 100 men. This was the brightest American military achievement of the war, and though it had no influence on the peace settlement, it made Jackson's name a household word and paved the way for his elevation to the presidency.

Florida: 1817-1818.—United States citizens on the Florida frontier were frequently harassed by Indians and outlaws who had found an asylum in the two Spanish provinces. The conditions became so bad that John C. Calhoun, the secretary of war, ordered Jackson to Georgia in December 1817, with instructions to "adopt the necessary measures to terminate . . . [the] conflict." Jackson envisioned the occupation of Florida and its annexation to the United States, and he thought he had the tacit approval of the administration for the measures necessary to accomplish this purpose. He occupied the Spanish forts at St. Marks and Pensacola (April-May 1818) and captured a number of prisoners, including British citizens Alexander Arbuthnot and Robert Christy Ambrister, who were executed. Jackson's high-handed acts were effective and popular, but they brought the country to the verge of war with Great Britain and Spain. The cabinet of President James Monroe handled the diplomatic situation successfully, but Jackson's later relations with Calhoun, John Quincy Adams (then secretary of state), and William Harris Crawford (secretary of the treasury) were strongly influenced by the incident. Jackson always contended that the subsequent purchase of Florida was a complete vindication of his actions. In 1821 he was governor of the Florida Territory for a few months, and later served part of a term in the United States Senate (1823-1825). These activities kept him in the national spotlight but did not contribute any special achievements adding luster to his name.

Presidency.—Jackson was a contender for the presidency in 1824 against Adams, Crawford, and Henry Clay. He received 99 of the 261 electoral votes, 15 more than Adams; but since none of the candidates had a majority in the electoral college, the contest had to be decided by the House of Representatives. The influential Clay, who was serving as speaker of the House, supported Adams, and the New Englander was chosen. Adams then named Clay as his secretary of state. Jackson and his partisans professed to see in this appointment the fulfillment of a bargain, and they began immediately to prepare for the next campaign. So successful was their strategy that in 1828 they won 178 of the 261 electoral votes. Jackson's joy over his political triumph was tempered by the death of his wife on Dec. 22, 1828. He always felt that her death was hastened by the scandalous stories which were circulated during the campaign.

The inauguration of President Jackson was the

occasion for a demonstration of the new spirit that was to pervade national affairs. Hundreds of visitors crowded Jackson's quarters at Gadsby's Hotel, where all were welcomed. Jackson refused to pay the customary courtesy call on the retiring president, holding Adams indirectly responsible for his wife's death. Adams left Washington before the inauguration, and precedent was broken in that the two men did not ride to the Capitol together. Daniel Webster and others reported that they never saw such a crowd before. There was overwhelming evidence that the new administration had enthusiastic popular support.

Jackson's election represented a triumph for the masses of the people and the new West. He was the first president from west of the Alleghenies, and he embodied to a great degree the hopes and aspirations of the West and the common man. He believed that good, honest men could fill the public offices, and he approved the removal of a large number of officeholders and the appointment of his followers to their places. In this way the spoils system was introduced into the federal government. Jackson depended for advice upon a group of personal friends, who became popularly known as the "kitchen cabinet." His own political views only gradually unfolded as the exigencies of national affairs brought problems to his attention.

Eaton Affair.—One of the first of President Jackson's problems was only indirectly connected with administration affairs, but it resulted in the dissolution of his cabinet, a cooling of relations between him and Vice President Calhoun, and the crowning of an heir apparent, Martin Van Buren. In January 1829, Senator John Henry Eaton of Tennessee, who had been named secretary of war, married Peggy O'Neale Timberlake, daughter of a Washington tavern keeper and widow of a United States naval officer. The reputation of Mrs. Eaton was questionable. Jackson became the champion of her virtue and strove to force her on social circles in Washington, but his threats were of little avail. Martin Van Buren, the secretary of state, being a widower and thus free from marital restraint, won increasing respect from Jackson because of the numerous courtesies he showed Mrs. Eaton. Calhoun's wife, on the other hand, was a leader of the anti-Eaton forces. The social freeze continued until Eaton resigned from the cabinet in April 1831 and the president reorganized his official family. The friendship that had existed between Calhoun and Jackson was strained, and the way was opened for an irretrievable break.

Nullification.—In the meantime, important affairs of state were demanding attention. In May 1830, Jackson's veto of the Maysville Road bill revealed that he was determined to protect the Treasury against the growing demand for funds to build canals, roads, and other internal improvements. More critical was the widespread dissatisfaction in the South with the federal protective tariff. This dissatisfaction was most extreme in South Carolina, which had a group of talented political leaders, headed by Vice President Calhoun. In January 1830, Robert Young Hayne of South Carolina, in a series of Senate debates with Daniel Webster, upheld the principle of state sovereignty and the power to nullify federal laws (see NULLIFICATION). The question uppermost in the minds of the citizens was which theory Jackson would support. The president kept his counsel, but a great public dinner on April 13,

1830, the anniversary of the birth of Thomas Jefferson, gave him an opportunity to offer the toast, "Our Union! It must be preserved!" Isaac Hill, a member of the kitchen cabinet, remarked, "A proclamation of martial law in South Carolina and an order to arrest Calhoun where he sat could not have come with more blinding, staggering force." Immediately after this incident the president received information that Calhoun, while secretary of war in Monroe's cabinet, had favored arresting Jackson for his actions in the invasion of Florida. Calhoun's inability to explain this position brought about the final break.

The Tariff Act of 1832 did not provide acceptable relief for South Carolina, and a state convention in November of that year declared the tariff acts null and void in the state, forbidding their enforcement there after Feb. 1, 1833. Calhoun was elected to the Senate in December, in order that he might have a more effective stage for the leadership of the movement, and he resigned from the vice presidency. Jackson met the nullification ordinance with a proclamation of his own (Dec. 10, 1832). He said, "I consider, then, the power to annul a law of the United States, assumed by one State, incompatible with the existence of the Union, contradicted expressly by the letter of the Constitution, unauthorized by its spirit, inconsistent with every principle on which it was founded, and destructive of the great object for which it was formed." Jackson ordered the military and naval forces prepared for any contingency. It appeared that civil war was inevitable.

The crisis was averted by the reopening of the tariff discussion in Congress, resulting in the passage of a compromise tariff law sponsored by Clay, accompanied by a Force Bill authorizing the use of the military to collect government revenue (March 1833). South Carolina had won protection for her interests, and the strength of the federal government had not been impaired. Jackson won the acclaim of the nation as a strong nationalist.

Bank of the United States.—The second Bank of the United States had been chartered in 1816 for a period of 20 years. The power of the bank over currency made it unpopular in the South and West, though Jackson's followers were by no means united in opposition to it. President Jackson at no time had been friendly toward it. He distrusted its power and doubted whether it was constitutional. In addition the bank had, he felt, used its influence against him in the presidential campaign. Nicholas Biddle, the bank's president, encouraged by Jackson's political enemies, decided to ask for a renewal of the charter prior to the election of 1832. It was thought that this move would be embarrassing to Jackson and might cost him his re-election. The bill providing for the recharter passed Congress on July 3, 1832, without difficulty, but Jackson vetoed it with a message that indicated no compromise, and Congress failed to override the veto.

The renewal of the bank's charter was the principal issue in the campaign of 1832. Clay, the National Republican candidate, endorsed its renewal, while Jackson opposed it. The Democrats accused the bank of attempting to influence the voters by calling in loans to state banks and contracting the currency. The underlying difference of opinion came between the merchant, manufacturing, and financial classes on one hand and the laboring and agrarian classes on the other. The

former feared the democratic upheaval, while the latter gave hearty approval to Jacksonian democracy. When the election was over, the president had received 219 of the 286 electoral votes cast.

Jackson took the decisive vote as an endorsement of his veto and made plans to bring about the gradual decline of the bank. He decided that government funds would be withdrawn, and that no more would be deposited in the bank. An order was issued that all receipts after Oct. 1, 1833, were to be deposited in the Girard Bank of Philadelphia and 22 other designated state banks. These became known as "pet banks."

Jackson's policy was bitterly criticized. In the Senate, a hostile majority led by Clay, Calhoun, and Webster passed a resolution of censure (1834), and it was not until 1837 that Jackson's partisans were successful in expunging the resolution from the records. The destruction of the bank was one of his greatest political triumphs.

Specie Circular.—Speculation was a major economic problem during Jackson's presidency. The public debt had been paid, and there was an abundance of free capital to be invested. Especially in the sale of public lands the speculative spirit was evident. In payment for land purchases the government received an assorted collection of bank notes of doubtful value. Restrictive measures proved unsatisfactory, and Jackson felt it necessary to issue the Specie Circular on July 11, 1836. The order required that payment for public lands be made in gold and silver, thus adding to the difficulties of the banks, especially in the West, where bank notes were plentiful and specie was scarce. The circular has often been cited as one of the contributing causes of the panic of 1837.

Foreign Relations.—Jackson's presidency was a period of relative tranquillity in foreign affairs. However, the question of trade with British colonies, especially the West Indies, had been an issue for many years. Jackson's administration secured in 1830 a reciprocity agreement with Great Britain opening this trade. The really remarkable characteristic of Jackson's administration was the relative harmony in the relations of Great Britain and the United States.

The most difficult foreign question was the spoliation claims against France. These claims, resulting from seizures during the Napoleonic Wars, had been presented from time to time without success. Jackson's foreign policy, as outlined in his first annual message to Congress (Dec. 8, 1829), was "to ask nothing that is not clearly right, and to submit to nothing that is wrong." He also affirmed that since the claims remained unsatisfied, they "must, therefore, continue to furnish a subject of unpleasant discussion, and possible collision, between the two governments." His policy of firmness caused France to sign a treaty in 1831 providing for payment of the claims.

The failure of the French government to provide funds for meeting the treaty obligations aroused Jackson's anger. In his message of Dec. 2, 1834, and again in a special message of Jan. 15, 1836, he asked congressional approval of a policy of reprisals in case France delayed longer the fulfillment of her obligations. The French were aroused, diplomatic negotiations were broken off, and preparations for war were made. British mediation of the dispute saved French honor, and the first payments were made in May 1836. Jackson's program of energetic action had been successful:

Charles Phelps Cushing

The Hermitage, Andrew Jackson's home near Nashville.

Last Years.—Jackson left the White House broken in fortune and health but still the idol of the people. He retained his popularity until the end of his life, and continued to wield great national influence. When he arrived at The Hermitage, he had less than \$100. He was forced to sell some of his lands, and to borrow \$10,000 in 1842. The debt was not paid before his death, but he pledged his estate to take care of the obligation. Jackson had always been plagued with precarious health, and the years in the presidency had told on his frail constitution. In retirement he was seldom free from pain. The new content he had given to the term "democracy" lived on as his greatest gift to posterity.

RICHARD A. McLEMORE,
President, Mississippi College.

JACKSON, Charles Thomas, American chemist and geologist: b. Plymouth, Mass., June 21, 1805; d. Somerville, Aug. 28, 1880. He graduated from Harvard Medical College in 1829 and spent the next three years in Paris, where he studied medicine, geology, and mineralogy. On his return, he practiced medicine in Boston, but gave it up in 1836 to set up a chemical laboratory. During 1837–1844, he was selected to make official geological surveys of Maine, Rhode Island, and New Hampshire, and in 1847 took part in a

survey of mineral wealth in the Lake Superior region for the federal government.

Jackson's inquiring and inventive mind led him to many discoveries which he seems to have put to little use. He made a working model of a telegraph in 1834, several years before Samuel F. B. Morse patented the invention. Jackson claimed to have pointed out the basic principles to Morse, and a heated controversy arose. After the announcement of the discovery of guncotton in 1846, he again claimed priority. About the same time he became involved in a bitter controversy with the dentist William Thomas Green Morton over the introduction of anesthesia in surgery. Jackson had evidently suggested to Morton the use of ether in extracting a tooth, and showed him how to administer it. In November 1846 a patent for the discovery was issued to Morton and Jackson together; but the latter, in letters to the French Académie des Sciences and the American Academy of Arts and Sciences, claimed sole credit for the discovery. The French Académie de Médecine divided the Monthyon Prize of 5,000 francs between Jackson and Morton, but Morton rejected his share, insisting the discovery was his alone. Jackson's later years were embittered by these quarrels, and from 1873 until his death he was afflicted by mental illness.

JACKSON, Chevalier, American laryngologist: b. Pittsburgh, Pa., Nov. 4, 1865; d. Philadelphia, Aug. 16, 1958. He studied at the Western University of Pennsylvania (now University of Pittsburgh) from 1879 to 1883, and took his M.D. at Jefferson Medical College, Philadelphia, in 1886. After further study in Europe, he practiced in Pittsburgh, specializing in diseases of the throat, and in 1912 was named professor of laryngology at the University of Pittsburgh School of Medicine. Jackson pioneered in peroral endoscopy, perfecting the technique of removing foreign bodies from the digestive tract by means of the esophagoscope and from the respiratory tract by means of the bronchoscope. In 1916 he established a bronchoscopic clinic in Philadelphia, where he served on the faculty of Jefferson Medical College and later at the University of Pennsylvania and Temple. Among his books, written in collaboration with his son, Chevalier Lawrence Jackson (1900-1961,) are *Bronchoscopy, Esophagoscopy, and Gastroscopy* (3d ed., 1934), *Cancer of the Larynx* (1939), and *Bronchoesophagology* (1950). Father and son cofounded the bronchoscopic clinic at Temple University in 1930.

JACKSON, Frederick George, English explorer: b. Alcester, Warwickshire, England, March 6, 1860; d. London, March 13, 1938. As a youth he spent three years in the hinterland of Australia and subsequently attended the University of Edinburgh. Inspired with an ambition to reach the North Pole, he made a preparatory sledge journey (1893-1894) across Siberia's frozen tundra from Khabarovo to Kirkenes, Norway, and under the patronage of Alfred C. W. Harmsworth (later Viscount Northcliffe), set out on his polar expedition later in 1894. Jackson failed to reach the North Pole, but made extensive explorations of Franz Josef Land over a period of three years. On June 17, 1896, he encountered Fridtjof Nansen and his companion, who were traveling by sledge, and probably saved their lives by returning them to Vardø, Norway, in one of his ships. For these services Jackson

was awarded the Norwegian Order of St. Olaf in 1898. He subsequently served in the army in the South African War (1899-1902) and World War I, and traveled in tropical Africa. He was also a member of the League of Nations investigating commission which reported the existence of slavery in Liberia (1930). Jackson's publications include *The Great Frozen Land* (1895); *A Thousand Days in the Arctic* (1899); and *The Lure of the Unknown Lands: North Pole and Equator* (1935).

JACKSON, Hall, American surgeon: b. Hampton, N.H., Nov. 11, 1739; d. Portsmouth, Sept. 28, 1797. Son of Dr. Clement Jackson of Portsmouth, N.H., he began to study medicine in his father's office, and then went to London for three years, specializing in the study of smallpox. While there, he learned the operation of cataract couching, which he later was one of the first to perform in America. He was also among the first to introduce the use of digitalis in America, obtaining it from foxglove which he grew from seed brought from England. He began to practice in Portsmouth, but in 1764 was called to Boston to perform inoculations during the smallpox epidemic there. Returning to Portsmouth, he aided in establishing smallpox hospitals on Henzell's Island and on Cat Island in Marblehead harbor. After the Battle of Bunker Hill (June 1775) he was called to Boston again to attend wounded soldiers. In November of that year the New Hampshire Provincial Congress commissioned him chief surgeon of the province's troops with the rank of colonel, and he served in this capacity throughout the Revolutionary War.

JACKSON, Helen Maria Hunt (nee FISKE), American author: b. Amherst, Mass., Oct. 15, 1830; d. San Francisco, Calif., Aug. 12, 1885. Daughter of an Amherst College professor, she married (1852) Edward Bissell Hunt, an officer in the army engineers, who was accidentally killed in 1863 while testing a submarine device which he had invented. Her only surviving child died two years later. Mrs. Hunt began to write for publication in 1865, contributing poems, articles, and stories to the *Nation*, *Independent*, *Hearth and Home*, and other magazines, frequently over the signature H.H. The Saxe Holm stories which ran in *Scribner's Monthly* have been attributed to her, though she never admitted their authorship. Much of her work was published anonymously. In 1872-1874 she visited California and Colorado, and in Colorado Springs met the financier William Sharpless Jackson, whom she married in October 1875.

While living in the West, Helen Hunt Jackson became deeply interested in the Indians and incensed at their neglect by the government. After several months of research at the Astor Library in New York, she wrote and distributed to the members of Congress, at her own expense, a review of the government's dealings with the Indian tribes, calling it *A Century of Dishonor* (1881). The only apparent result was her appointment to a special government commission in 1882 to investigate and report on the condition and needs of the Mission Indians of California. When this, too, failed to get results, she determined to use fiction to arouse public interest in the plight of the Indians and spur government action on their behalf. In 1884 she published *Ramona* (q.v.), which attained great popularity

as a romance of old California and still is widely read; it has also been made into a technicolor motion picture. Her only other noteworthy novel is *Mercy Philbrick's Choice* (1876), supposedly based on the life of Emily Dickinson, her school-mate and lifelong friend. *Glimpses of Three Coasts*, reminiscences of travel in Europe and America, was published posthumously in 1886, and *Between Whiles*, a volume of short stories, in 1887.

JACKSON, Sir Henry Bradwardine, British admiral and wireless expert: b. Barnsley, Yorkshire, England, Jan. 21, 1855; d. Hayling Island, Hampshire, Dec. 14, 1929. He joined the Royal Navy at the age of 13, became a torpedo officer, and in 1890 began to experiment with wireless communications for the fleet. As a result of his efforts, the Royal Navy was equipped with wireless installations in 1900, and in recognition of these services the Royal Society elected him a member in 1901. Knighted in 1906, he became the first head of the new Royal Naval War College at Portsmouth (1911) and chief of the War Staff of the Admiralty (1913). He was first sea lord (1915-1916) at the time of the Battle of Jutland, and president of the Royal Naval College at Greenwich from 1916 to 1919, when he was promoted admiral of the fleet. As first chairman of the Radio Research Board in Great Britain (from 1920), he directed important experiments in the study of radio waves. He won the Hughes Medal of the Royal Society in 1926.

JACKSON, Henry Rootes, American lawyer, diplomat, and Confederate general: b. Athens, Ga., June 24, 1820; d. Savannah, May 23, 1898. After graduating from Yale in 1839, he studied law in Georgia, began to practice in Savannah, and in 1843 was appointed a United States district attorney. He served through the war with Mexico as colonel of a Georgia regiment, and in 1849 was appointed a judge of the Superior Court, resigning in 1853 to become chargé d'affairs in Austria. Promoted minister resident, he served until 1858, and on his return from Europe was offered the chancellorship of the University of Georgia, but declined. When the Confederacy was formed, he accepted an appointment as judge in the Georgia courts, but on the outbreak of war resigned to serve in the Confederate Army. After the fall of Atlanta, while serving as brigadier general in Tennessee, he was captured and held prisoner until the close of the war, when he returned to his law practice. In 1885 he was appointed minister to Mexico, but resigned the following year because of his disapproval of the government's handling of the case of the American schooner *Rebecca*, seized by Mexico on a charge of smuggling. For many years he was president of the Georgia Historical Society and a trustee of the Peabody Education Fund (q.v.). He published a volume of verse, *Tallulah and Other Poems* (1850), and is remembered as the author of the poem *Red Old Hills of Georgia*.

JACKSON, Holbrook, English author and editor: b. Liverpool, England, Dec. 31, 1874; d. Bournemouth, June 16, 1948. After publishing an early work (1899) on Edward Fitzgerald's translation of Omar Khayyâm, he made his reputation as a critic and literary historian with

Bernard Shaw (1907), the first full-length study ever done on Shaw. It was followed by *William Morris* (1908; rev. ed., 1926) and *The Eighteen Nineties* (1913), a valuable critical history of that unique decade in English literature. In 1913, with Ralph Hodgson and the artist Claud Lovat Fraser, Jackson brought out *Flying Fame*, a series of chapbooks and broadsides notable for their typography and Fraser's illustrations, and containing original works by Walter de la Mare, James Stephens, and others. From 1917 to 1923 he published and edited the literary periodical *To-day*, in which some of the earlier work of Ezra Pound and T. S. Eliot first appeared. An expert on typography and problems of the publishing industry, Jackson was editorial director of the National Trade Press from 1917. His *Anatomy of Bibliomania*, 2 vols. (1930-31) is important as a source book for literary anecdotes.

JACKSON, Howell Edmunds, American jurist: b. Paris, Tenn., April 8, 1832; d. near Nashville, Aug. 8, 1895. He graduated from law school at Lebanon, Tenn., in 1856, and practiced in Memphis from 1858. Jackson originally opposed secession, but throughout the Civil War served the Confederacy as receiver of sequestered property. Elected to the state legislature in 1880 as a Democrat, he was chosen United States senator in 1881 by the votes of both Democratic and Republican members and served in the Senate until 1886, resigning to accept appointment as United States Circuit Court judge for the 6th circuit. He became the first presiding judge of the Circuit Court of Appeals established at Cincinnati, Ohio, in 1891, and in 1893 was appointed an associate justice of the United States Supreme Court. Shortly before his death he dissented from the majority decision holding the income tax unconstitutional.

JACKSON, James, American physician: b. Newburyport, Mass., Oct. 3, 1777; d. Boston, Aug. 27, 1867. The brother of Patrick Tracy Jackson (q.v.), he was educated at Harvard College and Medical School, and spent the year 1799-1800 in London, where he learned the newly discovered technique of vaccination, which he was among the first to put into practice upon his return to America. Jackson took an active part in the reorganization and rebuilding of Harvard Medical School, and in 1812 was appointed Hersey professor of the theory and practice of medicine there, serving for more than 20 years. He was also the leading figure in the organization of the Massachusetts General Hospital, opened in 1821. In a paper published (1822) in the *New England Journal of Medicine*, he gave the first description of peripheral alcoholic neuritis. His *Letters to a Young Physician* (1855) became a medical classic.

JACKSON, James, American soldier and statesman: b. Moreton Hampstead, Devonshire, England, Sept. 21, 1757; d. Washington, D.C., March 19, 1806. Emigrating to Georgia at the age of 15, he made his home in Savannah, and throughout the Revolutionary War served with the Georgia troops, attaining the rank of lieutenant colonel. When the British evacuated Savannah in July 1782, he commanded the American garrison installed in the city and was presented with a house and lot by the state legislature. After the war he studied law, built up an

extensive practice, and was several times a member of the Georgia legislature. Declining the governorship in 1788, he was elected to Congress in 1789 and to the United States Senate in 1793. He resigned, however, in 1795, returning to Georgia to fight the Yazoo Fraud (q.v.), which he succeeded in having repealed at the next session of the state legislature. He was a member of the convention that framed a new constitution for Georgia in 1798, and was elected governor the same year, serving until 1801, when he was again returned to the United States Senate, where he served until his death.

JACKSON, John Adams, American sculptor: b. Bath, Me., Nov. 5, 1825; d. Pracchia, Italy, Aug. 30, 1879. He received his early art training in Boston, and later studied in Paris. In 1851 he modeled a bust of Daniel Webster from portraits provided by the Webster family. While in Florence, Italy, in 1853, he did a bust of the poet Thomas Buchanan Read, which was purchased by the Union League Club of Philadelphia; and in Paris, in 1854, he made a portrait bust of the American minister to France, John Young Mason. Lyman Beecher and Wendell Phillips, among many other men of distinction, sat for him in the United States. He opened a studio in New York City in 1858, but two years later returned to Italy and settled in Florence. On a visit to New York in 1867 he designed a statuary group for the south gatehouse of the reservoir in Central Park, and in 1874 executed a soldier's monument in Lynn, Mass.

JACKSON, John Hughlings, English neurologist: b. Green Hammerton, Yorkshire, England, April 4, 1835; d. London, Oct. 7, 1911. He received his M.D. from St. Andrews University in 1860, and two years later in London joined the staff of the National Hospital for the Paralysed and Epileptic, where he remained active until 1906, specializing in nervous diseases. His earliest research, published about 1864, dealt with the cerebral location of speech defects (aphasia). He later (1870) discovered the source of local epileptic convulsions, named Jacksonian epilepsy in recognition of his work. He also identified uncinete epilepsy, so called after his discovery of its origin in the uncinete gyrus of the brain. In his Croonian lectures (1884) at the College of Physicians in London, he propounded the theory of three levels in the evolution and constitution of the nervous system, explaining nervous diseases as a process of dissolution of the higher levels, leaving the action of the lower levels uncontrolled.

JACKSON, Patrick Tracy, American industrialist: b. Newburyport, Mass., Aug. 14, 1780; d. Beverly, Sept. 12, 1847. He was the son of Jonathan Jackson, a broker and member of the Continental Congress, and the brother of James Jackson (1777-1867, q.v.). Patrick attended Dummer Academy, and at 15 was apprenticed to a Newburyport merchant. After several voyages to the West Indies and the Far East in charge of cargo, he had accumulated enough capital by 1808 to go into the shipping business for himself in Boston. He prospered, and when the War of 1812 disrupted his business, he began the manufacture of cotton textiles, organizing with Nathan Appleton (q.v.) and others the

Boston Manufacturing Company. Their mill at Waltham, equipped with power looms designed and constructed by Jackson's brother-in-law Francis Cabot Lowell (q.v.) and Paul Moody, is believed to have been the first mill in the world that handled the entire manufacturing process from raw cotton to finished cloth. In 1820, Jackson and his associates bought land on the Merrimack River and organized the Merrimack Manufacturing Company, founding the town of Lowell, Mass. Its business soon outgrew the transportation facilities provided by highway and canal, and in 1830 Jackson obtained a charter for a railroad between Lowell and Boston and directed its construction until completion.

JACKSON, Robert Houghwout, American jurist: b. Spring Creek, Pa., Feb. 13, 1892; d. Washington, D.C., Oct. 9, 1954. After completing the course at Albany Law School, he was admitted to the bar in 1913 and began to practice in Jamestown, N.Y. Within a few years he became corporation counsel of Jamestown and general counsel for several local public service corporations. Jackson came to the attention of Franklin D. Roosevelt while the latter was governor of New York and Jackson was serving on a commission to study the New York State judicial system. After Roosevelt became president, Jackson was named general counsel of the Bureau of Internal Revenue (1934), prosecuting the \$750,000 tax case against Andrew W. Mellon, former secretary of the treasury, who was later absolved of any intent to defraud. In 1935, Jackson became special counsel for the Securities and Exchange Commission, and in 1936 assistant attorney general in charge of the antitrust division. As solicitor general of the United States, from 1938, he argued before the Supreme Court an important series of cases involving the constitutionality of New Deal legislation, winning 38 of the 44 cases he presented for the government.

Jackson entered Roosevelt's cabinet as attorney general in January 1940, and 18 months later was sworn in as an associate justice of the Supreme Court, where he was noted for his independent, often sharply worded opinions. In May 1945 he was named by President Harry S. Truman to the War Crimes Commission and served as chief United States prosecutor when the International Military Tribunal was established. In this capacity he conducted the cases against such leading Nazis as Herman Goering, Joachim von Ribbentrop, Franz von Papen, and Julius Streicher. With the completion of the trials late in 1946, he returned to the Supreme Court. During his later years on the bench he was more middle-of-the-road in his thinking, but still vigorous and outspoken. In a partial dissent to the majority ruling on the Taft-Hartley non-Communist oath (May 1950), he said, "It is time enough for the law to lay hold of the citizen when he acts illegally, or in some rare circumstances when his thoughts are given illegal utterance. I think we must let his mind alone." His final judicial act was his appearance on the bench while ill, to verify the unanimity of the Supreme Court's 1954 decision against racial segregation in the public schools.

Among Jackson's publications are *The Struggle for Judicial Supremacy* (1941), *The Case Against the Nazi War Criminals* (1946), and *The Nürnberg Case* (1947).

JACKSON, Sheldon, American missionary and educator: b. Minaville, N.Y., May 18, 1834; d. Asheville, N.C., May 2, 1909. Graduated from Princeton Theological Seminary in 1858, he entered the Presbyterian ministry and became a missionary in the West, working with Indians and whites. In 1870 he was named superintendent of missions for the Rocky Mountain area and in 1884 for Alaska, where he became the first federal superintendent of public instruction in 1885. He served in this capacity for the rest of his life, setting up schools for whites, Indians, and Eskimos, and surveying the country's resources to help the inhabitants. Jackson induced the government to import into Alaska a reindeer herd from Siberia for the purpose of renewing the Eskimos' dwindling food supply, and thus laid the foundation for Alaska's present reindeer industry. His reports on the church and education in Alaska are valuable contributions to the history of the area.

JACKSON, Stonewall. See **JACKSON, THOMAS JONATHAN.**

JACKSON, Sir Thomas Graham, English architect: b. Hampstead, England, Dec. 21, 1835; d. London, Nov. 7, 1924. He graduated from Oxford in 1858, and for the next three years studied architecture with Sir George Gilbert Scott. Jackson designed many buildings for Oxford, including the New Examination Schools, whose foundations were laid in 1876; buildings at Brasenose College (1886-1889, 1909-1911) and Hertford College (1887-1890, 1903-1913), including the chapel (1908); and the restoration of Wadham College (1900-1908). In addition, Jackson designed many churches and schools throughout England, including buildings at Eton, Rugby, and Harrow. In 1913 he was made a baronet.

Jackson was skillful in the use of colored ornament and in the adaptation and combination of unusual processes and materials, such as sgraffito plaster work, terra cotta, marble, and mosaic. His study of architecture along the eastern Adriatic coast (now Yugoslavia) led in 1892 to his restoration of the campanile of the cathedral at Zara (Zadar). During his last years he wrote a series of comprehensive histories of Byzantine and Romanesque, Gothic, and Roman architecture.

JACKSON, Thomas Jonathan (called **STONEWALL JACKSON**), American Confederate general: b. Clarksburg, Va. (now in West Virginia), Jan. 21, 1824; d. Guiney's Station, Va., May 10, 1863. Orphaned when he was six, Thomas spent most of his boyhood at the home of his uncle, Cummins E. Jackson, in Lewis County. His schooling was sketchy, coming largely from itinerant teachers, and he was scholastically unprepared to win an appointment to the United States Military Academy at West Point, which he sought in 1842. The resignation of the successful candidate gave Jackson a second chance, and he received a cadetship. He had worked desperately for the appointment, since it represented his sole means of obtaining a higher education. Barely passing the entrance examinations, Jackson found himself in late June 1842 suffering the rigors of camp life with such classmates as Ambrose Powell Hill, George B. McClellan, Dabney H. Maury, and George E. Pickett. Though woefully deficient in training, Jackson grimly fought his way to 17th place in the class standing by the

time he was graduated in June 1846. He selected the artillery as his branch of service.

Early Career.—With K Company, 1st United States Artillery, Jackson went to Mexico as a brevet 2d lieutenant to fight under Gen. Zachary Taylor. Transferred to Gen. Winfield Scott's army, he participated in the siege of Vera Cruz (March 1847), saw action at Cerro Gordo in April, and was brevetted for gallantry in action at Contreras, Churubusco and Chapultepec. His outstanding conduct earned him the permanent rank of 1st lieutenant and the brevet rank of major by the end of the fighting in Mexico. Assigned to duty with occupation forces in Mexico City, Jackson spent several happy months there and became something of a social lion. He studied Spanish, flirted with romance, and urged by Capt. Francis Taylor, his commanding officer, he undertook a personal study of religion, beginning with Roman Catholicism. Soon he had evolved a private code of morals which served until his affiliation with the Presbyterian Church on Nov. 22, 1851.

In July 1848, Jackson returned to the United States and served at various New York and Pennsylvania forts until October 1850, when he and his company were sent to the Seminole Indian theater in Florida. At Fort Meade, Fla., he had an unhappy altercation with the post commander, Maj. William Henry French, and the episode ended with Jackson's departure from the service on May 21, 1851, with nine months' terminal leave. He accepted a professorship of natural and experimental philosophy and artillery tactics at the Virginia Military Institute (VMI) at Lexington, Va. His former Mexican war comrade and future brother-in-law, Maj. Daniel Harvey Hill, had nominated him for the position. Jackson taught at VMI from August 1851 until April 1861. Never a popular teacher, he became the butt of many cadet pranks, the object of much derisive doggerel verse, and the target of the Society of the Alumni. A few cadets saw beneath his cloak of shyness, and those came to appreciate him as a "grand, gloomy and peculiarly good man."

The Lexington decade brought great changes in Jackson's personal life. Here he found the religion he had long sought and devoted himself to it with characteristic wholeheartedness. Here, too, he found a real and happy home for the first time. On Aug. 4, 1853, he was married to Elinor Junkin, daughter of the Reverend George Junkin, president of Washington College in Lexington. Under her gentle influence he began to doff his relentless punctilio, to curb his terrible shyness, and to be himself—at least among his family and close friends. A tragic end to this period of home life came on Oct. 22, 1854, when Mrs. Jackson died in childbirth. After months of despondency, Jackson remarried. His new bride, Mary Anna Morrison of North Carolina, was also the daughter of a Presbyterian minister, and a sister of Mrs. Daniel Harvey Hill. After their marriage on July 16, 1857, the Jacksons bought a house and finally moved in during the winter of 1858. Again Jackson entered into the spirit of contented domestic life.

Civil War to Romney Expedition.—The first interruption of this new-found happiness came with the John Brown crisis in October 1859. Jackson took part of the VMI cadet corps to witness Brown's hanging in December, and afterward bent his efforts toward preparing for what-

ever emergency the Union might face. A Democrat and small slaveholder, Jackson voted for John C. Breckinridge in 1860 and remained a Union man until Virginia seceded on April 17, 1861. On April 21, Jackson led the VMI cadets to Richmond, and on the 27th, although unknown in Virginia political circles, he received a commission as colonel in the Virginia state forces, with orders to organize the defense of the strategic town of Harpers Ferry. Jackson, taking charge of a disorganized group of militiamen, soon had a well-trained brigade under his command, and posted guns to command the heights overlooking the town, the confluence of the Potomac and Shenandoah rivers, and the important Baltimore and Ohio railroad bridge. On May 24 he turned the post over to Gen. Joseph E. Johnston and assumed command of a brigade in Johnston's Army of the Shenandoah. With this brigade he engaged Gen. Robert Patterson's Union forces at Falling Waters, Va., on July 2, 1861, and in his first battle command of the war gained a tactical success. Shortly after this engagement he was commissioned a brigadier general in the Confederate Army, effective June 17, 1861.

Jackson's brigade, with the rest of Johnston's army, went to aid Gen. Pierre G. T. Beauregard at Manassas Junction on July 18, and on July 21 took a decisive part in the Battle of First Manassas (Bull Run). Posting his brigade on the strategic Henry House Hill toward the Confederate left, Jackson steadied the Southern front against the flank attack by Gen. Irvin McDowell's Union troops. Jackson's men, standing firm on the hill, caught the attention of Gen. Bernard E. Bee as he tried to rally his shaken troops; he pointed to Jackson's line and shouted an immortal battlecry: "There is Jackson standing like a stone wall. Let us determine to die here, and we will conquer." The sobriquet "Stonewall" stuck with Jackson from that day of victory at Manassas.

Praise for Jackson came from all parts of the Confederacy, and on Oct. 7, 1861, he was commissioned a major general. In November he went to the Shenandoah Valley to command the newly created Valley District, which embraced all the territory between the Blue Ridge and Allegheny mountains, from Staunton to Harpers Ferry. Finding only some 1,600 men available in the valley, Jackson called out the militia of the district and obtained the assignment of his own original "Stonewall Brigade." With additional reinforcements bringing his total strength to about 8,500 men, he began a winter campaign in January 1862 to reoccupy Romney, Va., then held by Union forces. After a march tragically like Napoleon's retreat from Moscow, Jackson occupied the town on January 14, left a garrison, detached troops to neighboring settlements, and took his own brigade back to district headquarters at Winchester, Va. The Romney expedition earned Jackson the hatred of some subordinates, and complaints to Richmond prompted Confederate Secretary of War Judah P. Benjamin to order the reconcentration of Jackson's entire command at Winchester. Faced with civilian interference in his military assignments, Jackson submitted his resignation, but the wise counsel of General Johnston, the urgings of clerical friends, and the protest of Virginia's governor, John Letcher, changed Jackson's mind.

Shenandoah Valley Campaign.—Ordered to protect Johnston's left flank against a thrust by the Union general, Nathaniel P. Banks, Jack-

son reorganized his army. When he heard that Banks had detached men to the eastern theater, Jackson determined to attack him in the hope of recalling the detached troops. With a reduced force he struck Banks' rear guard under Gen. James Shields at Kernstown on March 23, 1862, sustained a tactical defeat, but gained a strategic victory which brought Banks' men back to the valley. Gen. Robert E. Lee, who had direction of military operations outside of the Richmond sector, advised further pressure against Banks, and Jackson, reinforced by the division of Maj. Gen. Richard S. Ewell in late April, began his world-famous Shenandoah Valley campaign. Deceptively moving toward Richmond, he marched his own division rapidly out of the valley, reversed direction, and went to the support of Gen. Edward Johnson west of Staunton. With 10,000 men Jackson attacked Gen. Robert H. Milroy's forces near the village of McDowell, Va., on May 8, defeating and driving them toward Gen. John C. Frémont's Union army near Franklin, Va. With his left flank secure, Jackson returned to the Shenandoah Valley and, joined by Ewell's division, struck at Banks. With about 16,000 men and 48 guns, he obliterated Banks' outpost at Front Royal on May 23, thus forcing him to retreat from Strasburg toward Winchester. Washington was convinced that a major threat to the North had developed in the valley. Hearing of Banks' headlong flight, President Abraham Lincoln withdrew troops from General McDowell's army near Fredericksburg and consequently stalled General McClellan's operations against Richmond. Jackson had gained his primary objective; he had protected the Confederate capital for a time.

Jackson defeated Banks at Winchester on May 25, 1862, and drove him toward Williamsport on the Potomac. Advised that Lincoln planned to trap him, Jackson retreated swiftly—so swiftly that his men earned the name "foot cavalry"—and eluded two Federal armies. At Cross Keys and Port Republic, in the southern end of the valley, Jackson turned on the armies of Frémont and Shields, defeating them in succession on June 8 and 9. The lightning valley campaign had paralyzed no less than 60,000 Federal soldiers (at least 40,000 of whom should have been aiding McClellan at Richmond) and frightened Washington. It buoyed up sagging Southern spirits and gave the Confederacy a new hero.

With Federal thrusts blunted in the valley and with many bluecoats out of position beyond the Blue Ridge, General Lee called Jackson to Richmond to assist in defeating McClellan. Lee planned a wheeling turn around McClellan's right flank north of the Chickahominy River—a turning movement which would force the Federals out of their works and drive them into the James River. The attack was to begin on June 26, 1862, but Jackson proved unaccountably late. Lee's battle began badly, with a bloody attack on Union positions which Jackson should have flanked. All during the 26th, Jackson took no part in the action; but on the 27th, reinforced by D. H. Hill's division, he reached McClellan's flank and rear and sought to squeeze the enemy's right between his troops and Lee's units at Gaines' Mill. After costly fighting the Federals escaped across the Chickahominy. Lee's army rested a day while he sought information on enemy intentions. On June 29, Jackson was delayed most of the day at the Grapevine Bridge

by orders from army headquarters, and on the 30th he fell into a strange lethargy. He made no serious effort to cross White Oak Swamp Bridge, despite a heavy battle raging at nearby Frayser's Farm. For this failure he has been severely criticized by military analysts, and many reasons for it have been offered. Some ascribe it to unfamiliarity with the ground, to poor staff work, and to lack of experience in commanding a large force. Perhaps a better reason is physical exhaustion; Jackson had been in the saddle for several days prior to the White Oak action, and he was worn down by exertion, by the unaccustomed heat, and the dank swampland. All these factors combined to put him in a state of somnambulism. He regained his aggressiveness on July 1, fighting hard at Malvern Hill.

Second Manassas (Bull Run).—With McClellan driven to the protection of his gunboats, Jackson proposed an invasion of the North. Although Confederate resources did not permit a sustained offensive, Lee apparently concluded that Jackson did better in independent commands which permitted wide discretion, and began a model partnership with him, detaching Jackson to deal with a new Federal invasion army under Gen. John Pope. Jackson met Pope's advance under Banks at Cedar Mountain on Aug. 9, 1862, sustained an initial reverse, and then routed the enemy. Lee then determined to send part of the Army of Northern Virginia behind Pope and cut him off from Washington. Jackson drew the flanking assignment, took his wing of the army around Pope's right, and hit the Federal supply depot at Manassas Junction. After purloining and destroying an incredible amount of supplies, Jackson entrenched a strong position near the old Manassas battlefield and beat off a heavy attack by Pope on August 29. When Pope renewed the advance on the 30th, he went against both Jackson's and James Longstreet's wings, but did not know it until he had been beaten in the Battle of Second Manassas (Bull Run). One of Jackson's men ventured that the battle had been won by hard fighting, but Jackson, in a typical reply, answered: "No, no, we have won it by the blessing of Almighty God." Defeats might be the result of human error, but victories were gifts from Providence.

Harpers Ferry and Sharpsburg (Antietam).—Lee now decided to carry the war to the North, and in order to clear his line of communications with Richmond through the Shenandoah Valley, he again trusted to Jackson a vital independent assignment: Jackson's wing would eliminate the 11,000-man Federal garrison at Harpers Ferry and rejoin the main army near Hagerstown, Md., in mid-September. With cold efficiency Jackson plotted the reduction of the enemy garrison by artillery, and on September 15, Harpers Ferry was surrendered. The action had been one to please a professor of artillery tactics. Informed of the rapid advance of a rejuvenated Federal army, again under McClellan, Jackson left A. P. Hill's division to arrange the surrender and marched rapidly with the remainder of the wing to Sharpsburg, Md., where Lee had retired to reconcentrate. On September 17, Jackson's men resolutely stood like a stone wall on the left of Lee's line at the Battle of Sharpsburg (Antietam), and the timely arrival of A. P. Hill saved the day for the Confederates. Lee retired across the Potomac during the night of September 18-19. Jackson's quick decision to attack a

probing Union force at Shepherdstown, early in the morning of the 19th, probably saved the army; it certainly saved the reserve artillery.

After the Maryland campaign Lee reorganized the army into two corps. On Oct. 10, 1862, Jackson was commissioned a lieutenant general and assigned command of the Second Corps; Longstreet would command the first. Lee took Longstreet's men east to watch Federal moves, leaving Jackson in the Shenandoah. On November 22 (the day before his daughter Julia Laura was born), Jackson moved his corps toward Fredericksburg, where he took position on the right of Lee's line. Here he held against determined Federal assaults during the Battle of Fredericksburg (Dec. 13, 1862).

The army went into winter quarters near Fredericksburg to await the spring campaign. These quiet months Jackson devoted to improving himself as an army administrator, and in keeping with his motto, "You may be whatever you resolve to be," he succeeded.

Chancellorsville.—Federal Gen. Joseph Hooker began the spring campaign on April 29, 1863, by marching up the Rappahannock in an attempt to turn Lee's left. Jackson, sent to meet Hooker, hit the enemy advance in the Wilderness near Chancellorsville on May 1, 1863. By nightfall Jackson and Lee, working in close harmony, decided that Hooker must be flanked, and Lee gave Jackson his greatest orders: if a feasible route could be found, he would command the flank march. By dawn of May 2, scouts reported a road which would lead Jackson behind the bluecoats. He prepared to march with some 28,000 men, leaving Lee about 15,000 to face Hooker's entrenched force of over 100,000. At 5:15 p.m. on May 2, after a 15-mile march—one of the greatest marches of history—Jackson attacked Hooker's right flank element, the 11th United States Army Corps, and literally blew it out of the war. He intended to get between Hooker and the fords of the Rappahannock and to squeeze the enemy between his own and Lee's men. After the first impetus of the attack waned, Jackson halted his men to regroup and trotted ahead of his line to reconnoiter.

When he rode back on his sorrel toward his own men, he and his staff were mistaken for Federals and fired on; Jackson's left arm was shattered, and he was hit in the right hand. His arm was amputated, his other wounds were dressed, and he was moved to Guiney's Station, a safe distance from the front. Although indications were that he would recover, pneumonia set in on May 7; he grew rapidly worse, sinking into a limbo of lucidity and delirium. Several times Jackson roused to see his wife. He clung firm to his faith, and occasionally he thought of the army. In the afternoon of May 10, 1863, a Sunday—he had always wanted to die on Sunday—he rallied to speak his stirring last words: "Let us cross over the river, and rest under the shade of the trees."

The Confederacy grieved for its fallen captain; even the Federals mourned the loss of a great American. Richmond held one of the last state funerals, and Stonewall was laid to rest in Lexington. Many speculated then, and have since, that with his death the South lost its chance to win the war. Certain it is that the impetus of victory died with him.

JACKSON, William, American soldier, secretary of the Constitutional Convention: b. Cumberland, England, March 9, 1759; d. Philadelphia, Pa., Dec. 18, 1828. Brought up by a guardian in South Carolina, he joined the colonial forces at the outbreak of the American Revolution, participated in the 1778 expedition against St. Augustine, Fla., and served as aide to Maj. Gen. Benjamin Lincoln in the Southern Department, with the rank of major. As secretary to John Laurens on his mission to France in 1781, Jackson supervised the shipment of supplies to the Continental Army. Returning to the United States in February 1782, he was assistant secretary of war for two years under Lincoln. When the Constitutional Convention was called in Philadelphia in 1787, he petitioned George Washington for the post of secretary, and on Hamilton's nomination received the appointment. By order of the convention its records were burned, except the journal of proceedings and the yeas and nays; these, in Jackson's hand, are the only surviving official convention records. Jackson was admitted to the Pennsylvania bar in 1788, and the following year President Washington appointed him one of his personal secretaries. He resigned at the end of 1791 to enter private business, and from 1797 to 1801 was surveyor of customs in Philadelphia.

JACKSON, William Henry, American photographer and painter: b. Keeseville, N.Y., April 4, 1843; d. New York, N.Y., June 30, 1942. He served for a year in the Union Army during the Civil War, and after traveling west to California, settled in Omaha, Nebr., as a photographer. In 1870 he joined the United States Geological Survey as official photographer for the expedition headed by Ferdinand V. Hayden; his photographs of the Yellowstone region, along with the expedition's report, were influential in the erection of Yellowstone National Park by act of Congress in 1872. Jackson remained with the Survey for eight years, photographing the scenic wonders of the West, and later also took notable pictures of boom towns such as Leadville and Cripple Creek, Colo. From 1879 to 1897 his headquarters were in Denver and subsequently in Detroit, Mich. In 1924 he settled in Washington, D.C., and took up painting, and at the age of 92 began a series of murals on the Old West for the Department of the Interior Building. His 40,000 negatives were bought by Henry Ford for the Edison Museum in Dearborn, Mich.

Consult his autobiography, *Time Exposure* (1940); and Jackson, Clarence S., ed., *Picture Maker of the Old West* (1947).

JACKSON, town, Alabama, in Clarke County, on the Tombigbee River, 60 miles north of Mobile. In a lumbering and farming area, the town manufactures hosiery, but the atmosphere of the Old South lingers on in the Greek Revival man-

sions and the oak-lined streets. Jackson is served by the Southern Railway System. Artesian mineral wells and Salt Springs State Park are nearby, while south of the town are the swamps of the Tombigbee River. Originally a trading post, Jackson was incorporated as a town in 1816. Pop. 4,959.

JACKSON, town, Louisiana, on Thompson Creek, 27 miles north of Baton Rouge, at an altitude of 100 feet. Served by the South Shore Line railroad, it is the largest town in East Feliciana Parish. Originally called Bear Corners, and later Buncombe, it was renamed Jackson after the victory of Andrew Jackson at the Battle of New Orleans (1815). The East Louisiana State Hospital for mental diseases is situated in Jackson. The town is governed by a mayor and council. Pop. 1,824.

JACKSON, city, Michigan, situated at an altitude of 940 feet on the Grand River about 70 miles west of Detroit. It is the seat of Jackson County, and an industrial, commercial, and rail center for the surrounding agricultural area. Among its manufactures are metal products, auto and airplane parts, machine tools, heating apparatus, furniture, clothing, and food products. The city is served by American Airlines and by the New York Central and Grand Trunk Western railroads, and has extensive railroad shops. Jackson Junior College is located here, and Michigan State Prison nearby.

Named after Andrew Jackson, the place was settled in 1829, incorporated as a village in 1843, and as a city in 1857. A state gathering held here on July 6, 1854, was one of the first to adopt the name "Republican Party" for the coalition of antislavery forces forming in the North after the Kansas-Nebraska Act of that year. Jackson has been governed by a council and city manager since 1915. Pop. 50,720.

JACKSON, city, Minnesota, seat of Jackson County, on the Des Moines River, 27 miles west of Fairmont. Its altitude is 1,485 feet. The city is a trade and shipping center for a farm area, freight service being supplied by the Chicago, Milwaukee, St. Paul and Pacific Railroad. The region yields grain, livestock, poultry, and dairy products, and wood products are made here. Settled before 1857, it was part of a large area destroyed in 1862 by the Sioux Indians led by Little Crow. A marker commemorates the victims massacred in Jackson. The settlement was replatted in 1866 and incorporated in 1881. Pop. 3,370.

JACKSON, city, Mississippi, state capital and seat of Hinds County, located on the west bank of the Pearl River, 195 miles south of Memphis, Tenn., at an altitude of 295 feet. It has the commission form of government.

Jackson is one of the chief commercial and industrial centers of Mississippi, with trade in cotton and other agricultural products. The city's manufactures include lumber, wood products, furniture, cottonseed oil, clay products, fluorescent lamps, vehicle body parts, steel and iron castings, machinery, bricks and tiles, hydraulics, kitchenware, clothing, and packed meat. Natural gas fields just south of Jackson have greatly stimulated industrial growth since they were opened in the 1930's. The city is served by the

Gulf, Mobile, and Ohio Railroad (freight only) and the Illinois Central. Its municipal airport, greatly enlarged in 1949 by the acquisition of the United States Air Force field (Hawkins Field), is served by Southern Airways and Delta, Chicago, and Southern Air Lines.

Jackson's educational facilities include Belhaven College, Millsaps College, the University of Mississippi School of Medicine, and Jackson College for Teachers. Nearby are Mississippi College, in Clinton, and Tougaloo Southern Christian College. All are coeducational. The city has many libraries and a state historical museum, and it maintains its own symphony orchestra and a municipal art gallery. Livingston Park houses the city zoo, while in Battlefield Park Confederate trenches and cannon are still to be seen. The state fairgrounds are also located in Jackson.

History.—Late in the 18th century the French Canadian Louis Le Fleur established a trading post on the Pearl River for trade with the Choctaw Indians. In 1821 the state legislature chose the site, called Le Fleur's Bluff, to be the state capital, and the area was platted and laid out as a seat of government, with alternating squares for buildings and parks. The original statehouse, completed in 1821, first housed a session of the legislature on Jan. 23, 1822. The settlement was renamed after Andrew Jackson, soon to become president, and in 1833 it was incorporated as a town. Although up to 1832 there had been agitation to rescind Jackson's designation as capital, this movement was defeated. Mississippi's second statehouse, now called the Old Capitol, was built in Classic Revival style, with a silver dome. First occupied in 1839, it was completed three years later, as was also the governor's mansion.

During the Civil War, Jackson was twice taken by Union forces, in May and again in July 1863 (see JACKSON, BATTLE AND SIEGE OF). In July, under Gen. William T. Sherman, it was virtually destroyed by fire, except for a few private homes and the Capitol and governor's mansion; these two state buildings and some antebellum homes still survive. Jackson temporarily lost its place as state capital (1863-1865); but after the war, although retarded by the carpetbag rule of the reconstruction era, the city was rebuilt and continued to grow. A new Capitol building, authorized in 1900, was opened in 1903. Although state government has always been a major activity, industry has grown tremendously during the 20th century, with resulting population increases. From a population of 7,816 in 1900 the city grew to 22,817 in 1920, and in the next four decades grew more than sixfold in size. Pop. 144,422.

JACKSON, city, Missouri, seat of Cape Girardeau County, near the Mississippi River, 10 miles northwest of the city of Cape Girardeau, at an altitude of 430 feet. It is a trade and processing center for an area producing timber, grain, and other farm commodities, freight service being supplied by the Missouri Pacific Railroad. Shoes, bricks, lumber, and dairy products are manufactured here. Selected as the site for the county seat in 1814, the new settlement was named for Andrew Jackson and incorporated as a town in 1819. Pop. 4,875.

JACKSON, city, Ohio, county seat of Jackson County, 28 miles northeast of Portsmouth, at

an altitude of 670 feet. The city has steel mills and foundries, and manufactures cigars, clay products, and lumber; natural resources of the locality include coal, gas, clay, gravel, and silica. The Baltimore and Ohio, Chesapeake and Ohio, and Detroit, Toledo, and Ironton railroads furnish transportation.

Jackson was founded in 1817 and soon became a center for Welsh settlers, who at first engaged in farming but in the 1840's began to turn to the coal mines and iron furnaces of the region. The city is noted for its annual eisteddfod (q.v.), in which choral groups from Ohio and neighboring states participate. The city government is by mayor and council. Pop. 6,980.

JACKSON, city, Tennessee, seat of Madison County, located on South Fork of Forked Deer River, about 75 miles northeast of Memphis, at an altitude of 395 feet. Served by the Gulf, Mobile, and Ohio, the Illinois Central, and the Nashville, Chattanooga, and St. Louis railroads, it is a center for industry, railroad repair, and the shipment of such agricultural products as corn, strawberries, and tomatoes. Among its industries are furniture, cotton and cottonseed products, electrical equipment, paper boxes, beverages, and lumber and steel products. Jackson is the home of Lane College, Union University, and Lambuth College, all coeducational. The railroad engineer John Luther Jones, the Casey Jones (q.v.) of ballad fame, is buried here; a monument was erected to his memory in 1947. Several prehistoric mounds have been found in the vicinity.

First settled by North Carolinians in 1819, the community was named for Andrew Jackson. It was incorporated as a town in 1823 and soon after became county seat; it was chartered as a city in 1845. With the coming of the railroad in 1858 it grew rapidly as a trade center for farm products, lumber, and furs. In 1862 the city was headquarters for Confederate Gen. Pierre G. T. Beauregard, but was captured by Union forces in the same year and for a time was the headquarters of Gen. Ulysses S. Grant. It has the commission form of municipal government. Pop. 34,376.

JACKSON, Battle and Siege of, engagements (May and July 1863) in the Vicksburg campaign of the American Civil War. Having failed to take the Mississippi River stronghold of Vicksburg, Miss., from the north, Gen. Ulysses S. Grant determined to attack from another direction. Marching to the south, forces under Grant took Fort Gibson, Miss., and seized the base at Grand Gulf. Then, turning northeast, they won at Raymond on May 12. In order to cut off the Confederate supply line to Vicksburg, Grant determined to take Jackson, major connecting point for Confederate railroad lines. Confederate Gen. Joseph E. Johnston, in Jackson with 6,000 troops, retreated, ordering a small-scale delaying action, and Grant took the city easily on May 14. He evacuated almost immediately to press on to Vicksburg, while Gen. William T. Sherman remained for two days to destroy roads, bridges, factories, and arsenals.

After the surrender of Vicksburg (July 4), Johnston, who had been maneuvering to strike in the rear while Grant was engaged in the siege, fell back to Jackson. Sherman moved to retake the city and began to shell it on July 11, hitting

every part of town. The siege was prosecuted night and day, and on the morning of July 17, Jackson was found evacuated, General Johnston having retreated. General Sherman remained five days at Jackson, destroying much property, and then returned to Vicksburg. The Union loss at Jackson from July 11 to 16 was 129 killed, 762 wounded, and 231 missing or captured. The Confederate loss from July 5 to 25 was 71 killed, 504 wounded, and 764 captured or missing.

JACKSONVILLE, city, Alabama, in Calhoun County; altitude 720 feet; on the Southern Railroad, 18 miles southeast of Gadsden. Situated in a cotton and dairying region, the city's chief industries are the manufacture of cotton fabrics and yarn. A state teachers college is located here. The town was settled in 1822. Pop. 5,678.

JACKSONVILLE, city and port of entry, Florida, seat of Duval County, in the northeastern corner of the state, on the west bank of the St. Johns River, 20 miles from the ocean by water and 14 miles by land; altitude 20 feet. It is an important trading port and one of the leading railroad, air, and motor freight centers in the South. It is 138 miles south of Savannah, 212 north of Tampa, 165 east of Tallahassee, and about 1,000 miles from New York. It is served by the Seaboard Air Line, the Atlantic Coast Line, the Florida East Coast, and the Southern Railway System.

The port enjoys a strategic geographical position with respect to ocean routes to South America, Panama, and the Far East, and is usually the last port of call for vessels bound to those countries from ports northward on the Atlantic Coast. It has an excellent harbor on the Saint Johns River, sheltered from all storms and open to navigation throughout the year. The mean tide range is about 13 inches, with tidal currents not of sufficient strength to affect shipping adversely. The control of the port is vested in the City of Jacksonville, a commission of five men having supervision and control of the municipal terminals with power to extend and improve them, as well as to fix the rates and charges for their use. In 1950 there were 81 piers, wharves, and terminals at the port of Jacksonville, of which 65 were owned and operated by private interests. These provide more than 8 miles of vessel berthing space with water depths alongside up to 34 feet at mean low water, which is the channel depth. In 1950 work was begun on the Dames Point-Fulton Cut-off Channel which would materially shorten the distance from the ocean to the harbor.

Commerce and Industry.—Jacksonville's industrial activities show remarkable expansion since 1940. Wood and metal-working plants produce lumber, furniture, millwork, boxes, paper, and machinery. Other manufactures include naval stores, cigars, concrete blocks, glassware, fertilizers, and feeds. The processing of citrus fruits and meat products, and boat building and fishing are also important occupations. The growing tourist trade provides one of the city's major sources of income, and the selection of Jacksonville as the site of a large naval training station in 1940 has added further to city development.

Cultural Facilities.—In addition to primary, secondary, parochial, and private schools, Jacksonville has a junior college and a college of

music, the latter offering a four-year course. Other cultural advantages include a public library; a Little Theater group; the Children's Theatre, known as Teen Town, and the Children's Museum; the Art Center, the Garden Center, and the Symphony Society.

Places of Interest.—The Jacksonville Recreation Department has jurisdiction over a large number of widely scattered city areas which provide organized recreation facilities for the city's population. These include tennis courts, soft ball diamonds, swimming pools, and golf courses. The excellent freshwater and saltwater fishing attracts both residents and visitors. The city has an annual \$10,000 fishing tournament open to all comers. There is a free zoo overlooking Trout River, and two dog-racing tracks provide entertainment. The enormous Gator Bowl is the scene of the New Year's Day football game.

Government and History.—The city's government is a combination of the mayor-council and the commission types. The early history of Jacksonville is the story of the river on whose banks the city stands. The French naval officer Capt. Jean Ribaut placed a stone column beside the mouth of the river in 1562. In 1564 a Huguenot colony built Fort Caroline at St. Johns Bluff, a few miles upriver. The next year the Spanish mariner Pedro Menendez de Avilés, then adelantado of Florida, destroyed the little French colony. During the 18th century the English slave hunters were raiding the Florida missions repeatedly and by 1763 they had become masters of Florida.

The first settlement on the present city site was made by Lewis G. Hogan in 1816, whence Hogan's Creek, dividing the city, is named. In 1822 the town was laid out and named in honor of Andrew Jackson, the first territorial governor of Florida. It was incorporated in 1833.

Population.—The Seminole War (q.v.) greatly retarded the development of Jacksonville, but at conclusion of hostilities in 1842 a steady growth took place. The population in 1910 numbered 57,699; in 1930 (including South Jacksonville), 135,146; and in 1960, 201,030.

JACKSONVILLE, city, Illinois, seat of Morgan County; altitude about 600 feet; on the Burlington, the Wabash, and the Gulf, Mobile, and Ohio railroads; 34 miles southwest of Springfield. The principal crops of the county are corn, wheat, oats, soybeans, and hay. The city's principal industries are the manufacture of textile goods, Ferris wheels, electric appliances, food products, and steel bridges; also book binding. Jacksonville has a public library, two college libraries, and an art museum. It is the home of Illinois College, founded in 1829, and of MacMurray College for Women. When established in 1846, MacMurray College was known as the Illinois Conference Female Academy and was sponsored by the Methodist Episcopal Church. It has ceased to be denominational. Courses are offered in music, fine arts, and home economics, in addition to the ordinary academic subjects. The city is also the seat of state schools for the blind and the deaf, and a state mental hospital.

Jacksonville played a prominent part in the development of culture in Illinois as well as in the state's political history, and it was one of the first communities in Illinois to enjoy the advantages of railroad transportation. Here Stephen A. Douglas and William Jennings Bryan began their

careers in the practice of law; the site of Bryan's home is marked. Duncan Park is named in honor of Gov. Joseph Duncan, head of the state government from 1834 to 1838; he moved to Jacksonville in 1830, and died there. The site of another home, that of Col. John J. Hardin, is marked as the birthplace of Col. Hardin's daughter, Ellen Hardin Walworth, who was one of the three founders of the Daughters of the American Revolution. An interesting point in Jacksonville is the Corner of the Four Churches, a street intersection with a church at each corner. Notable buildings are the courthouse, the federal building, the city hall, the American Legion Memorial Home, the Masonic Temple, and the state institutional buildings. The origin of the city's name is somewhat obscure, but the most probable tradition seems to be that it was selected in honor of Andrew Jackson. First settled about 1818, the city was platted in 1825, and incorporated in 1830. In 1837 it contended for the honor of selection as capital of the state. Before the Civil War it was a station on the Underground Railroad. The city's government is administered by mayor and council. The water, power, and lighting systems are under municipal ownership. Pop. 21,690.

JACKSONVILLE, town, North Carolina, Onslow County seat, on the New River, 36 miles south of Kinston. It is a popular resort, with fishing. Camp Lejeune, the United States Marine base, is 10 miles southeast of the town. Pop. 13,491.

JACKSONVILLE, city, Texas, in Cherokee County; altitude 515 feet; served by the Missouri Pacific, the St. Louis Southwestern, and the Southern Pacific railroads; about 120 miles southeast of Dallas. Situated in a productive agricultural area, the town is a trading and shipping center. The principal crop of the area is tomatoes which are shipped to markets in the United States and Canada. Industries include basket, box, and garment factories, canneries, and cotton presses. Lon Morris College and Jacksonville College are situated here. The city also has a public library and several parks. First settled on the present site about 1872, Jacksonville was incorporated as a city in 1930. It has commission government with a city manager. The water supply system is publicly owned. Pop. 9,590.

JACKSONVILLE BEACH, city, Florida, in Duval County; on the Atlantic Ocean, 15 miles east of Jacksonville. It is noted as a beach resort; there is also a concrete industry. The city was incorporated in 1907. It has council-manager government. Pop. 12,049.

JACMEL, zhâk-mě'l, seaport, Haiti, in the Ouest Department, on the south coast of the republic, on Jacmel Bay, about 25 miles southwest of Port-au-Prince. Vessels anchor offshore. There is regular steamer communication with American and English ports. A commercial center, it ships bananas, coffee, and other products of this fertile agricultural region. There are manganese deposits near by. Pop. (1950) 8,545.

JACOB, from Hebrew word *Ya-aqob*, literally "to seize the heel," or "supplant," also called Israel, third patriarch and son of Isaac and Rebekah. The story of his life as told in Genesis has many dramatic incidents. The strug-

gle before birth between the two brothers, their antagonism due to the episode of the birthright and later to the subterfuge whereby Jacob secured his father's blessing, Esau's deadly hatred, the wanderer's dream and Jacob's fleeing to safety, his marriage with Laban's daughters, how his quiet life was disturbed and again he became a pilgrim; the vision of the wrestling angel, his reconciliation with Esau and subsequent arrival at Hebron, where his parents lived, with his twelve sons, fathers of the ten tribes of Israel—all these events can be read and read again without losing their interest. The resemblances throughout the careers of the patriarchs—brotherly strife, parental overfondness and the rest, only emphasize the human quality of the narrative.

After ten years, as the closing chapters of Genesis inform the reader, Jacob's favorite son, Joseph, became leading actor in the drama. In their anger at his airs of superiority, his brothers sell him to a band of Ishmaelites, telling Jacob that a wild beast had devoured him. Later, as Canaan was visited by a severe famine, the sons were sent to Egypt to buy corn, Benjamin being retained at home, but Jacob was obliged to let him go with the rest, as Joseph had refused otherwise to release Simeon held as hostage. How Jacob heard on the second return of his sons from Egypt that Joseph was ruler, how he set out to meet him, with a retinue of 66 persons, 11 sons and their children, and how Joseph met him at Goshen, to be received later by Pharaoh and assigned a residence "in the best part of the land, in the land of Rameses," complete a thrilling narrative. At that time, Jacob was 130 years of age. His death was the next great episode, but before his passing he made Joseph swear not to bury him in Egypt, but in the family sepulchre in Canaan. Then adopting Joseph's two sons, he blessed all his sons in solemn assembly, giving Joseph's younger son precedence over the elder and assigning to Joseph a portion more than his brothers. He was 147 at his death, his body being embalmed in Egyptian fashion. It was accompanied back to Canaan by an immense retinue including all the servants of Pharaoh and all the elders of Egypt and was laid at rest in the cave of Machpelah at Hebron.

The story of Jacob, as can be said of the other patriarchs, has been attacked as unhistorical, a charge easily made, if not substantiated. It is, however, a source-book of evidence on marriage customs, pastoral occupation, belief and traditions of the people, which must have had a basis of fact to be related with such naturalness and simplicity. The olden rabbis in their popular expositions of the Bible or "midrashim" realize their value for character building. Jacob is a favorite theme, and the homilies, however apparently trivial at times, had their significance in keeping alive the study of Scripture. Much that seems obscure and of doubtful worth in the text receives fresh meaning. Take the story of the birthright, for example. Esau was fresh from the slaying of Nimrod and two of his companions, when he sold the birthright. In desiring it, Jacob wished chiefly its spiritual prerogatives. It is another opinion that Jacob wanted the birthright, because the first born was forerunner of the priest who offered the family sacrifices and he felt that Esau was not fit to bring offerings to God. How the Midrash enlarges upon Scripture is

illustrated by the statement that Jacob gave three injunctions to his sons before his death. They should not worship idols, nor blaspheme the name of God, nor permit a pagan to touch his corpse. On each side of his coffin, three of his sons were to be stationed, just as the tribes were later gathered in the wilderness. Joseph's order to have Jacob's body embalmed was not regarded with favor; it seemed to indicate a limitation of divine power.

ABRAM S. ISAACS.

JACOB, John, British soldier and colonial administrator. b. Woolavington, Somerset, Jan. 11, 1812; d. Jacobabad, India, Dec. 5, 1858. Commissioned in the East India Company's service in 1828, he participated in the Afghan War of 1838 and many Indian frontier operations. Political superintendent and commandant of the frontier of Upper Sind in 1843, he suppressed marauding tribesmen. A brilliant cavalry leader, he invented an improved rifle, to be used with an explosive bullet, also of his invention. The year of his death he was authorized to raise two infantry regiments to be called "Jacob's Rifles" and to be armed with the weapon he invented. Among General Jacob's publications are *Large map of Cutchee and the north-west frontier of Scinde* (London 1848); *Record Book of the Scinde Irregular Horse*, 2 vols. (London 1853, 1856); *Tracts on the Native Army of India, its Organisation and Discipline* (London 1857).

JACOB, Joshua, Irish founder of the "White Quakers": b. Clonmel, County Tipperary, c.1805; d. Wales, Feb. 15, 1877. By birth a Quaker, he was disowned by the Society of Friends in 1838. He then formed a religious society of his own which, commencing in 1843, held a yearly meeting in Dublin. Because of their practice of wearing only undyed garments they were called "White Quakers." The sect condemned the use of clocks, watches, bells, and newspapers. Accused of misappropriating the property of orphans of whom he was guardian to use for the furtherance of his religious experiments, Jacob was sued in chancery court for recovery of the funds and received a prison sentence of two years for contempt of court. About 1849 he established a community at Newlands, near Dublin. The members made bruised grain their staple diet and abstained from flesh foods. On the death of his wife, from whom he was separated, he married a Roman Catholic and reared a large family in that faith.

JACOB BEN CHAYYIM BEN-ISAAC IBN-ADONIA, Jewish author: b. Tunis about 1470; d. Venice about the middle of the 16th century. Soon after the year 1500 the Jews of Tunis were severely persecuted. He fled to Italy and lived in Rome, Florence and Venice. At Venice he found employment as proofreader on the Bamberg edition of the Rabbinic Bible which was prepared under the direction of Felix Pratensis. The second edition (4 vols., Venice 1524-1525) was prepared by Jacob ben Chayyim. It is noted for the amount of erudition displayed, especially in connection with the Masorah. It contains the text, with the Masorah, the Targums, the Commentaries of many Jewish scholars including his own.

JACOBA or JACQUELINE, OF BAVARIA or OF HOLLAND, countess of Hol-

land, Zeeland and Hainault: b. July 25, 1401; d. Teilingen castle, near Sassenheim, South Holland, Oct. 6, 1436. The only child and heiress of William IV, duke of Bavaria and count of Holland, Zeeland, and Hainault, she was married as a child to John of Touraine, second son of King Charles VI of France, who became dauphin on the death of his older brother Louis. The death of John in April 1417, and of Jacoba's father two months later, left the young widow an heiress of vast estates. Her uncle John the Fearless, duke of Burgundy, married her to her cousin John IV, duke of Brabant in 1418. However, another uncle, her father's brother John of Bavaria, bishop of Liège, contested her inheritance. In 1419, through the mediation of John the Fearless, a treaty of partition was made between the rapacious prelate and his niece. But this did not satisfy the uncle who, on April 21, 1420, extorted from her weak husband possession of Holland and Zeeland.

Later that year Jacoba took refuge in England where she was granted a court pension and was one of the godmothers of Henry VI. Pedro de Luna, the Spanish antipope who maintained his title of Benedict XIII, annulled her marriage with Brabant, and in the autumn of 1422 she married, as third husband, Humphrey, duke of Gloucester (1391-1447). Politically the marriage was very injurious to English ambitions for hegemony in the Netherlands, since it placed Gloucester in opposition to Philip, duke of Burgundy, who had succeeded his murdered father in 1419 and the following year had concluded an alliance, the Treaty of Troyes, with Henry V of England. The Anglo-Burgundian alliance against France was thus imperiled. Gloucester and his older brother John, duke of Bedford, now endeavored to obtain from Pope Martin V a legitimization of the marriage; but before any papal decision had been reached Gloucester and Jacoba crossed to Calais in October 1424, with 5,000 troops, bent on reconquering Hainault (the modern Belgian province of Hainaut and French Department of Nord). Marching through Burgundian territories unopposed, they took peaceable possession and, on December 4, the estates of Hainault recognized Gloucester as their count.

Philip at once concluded a truce with France and challenged Gloucester to a duel. On the pretext of preparing for it Humphrey returned to England with Eleanor Cobham, his latest mistress, leaving Jacqueline to be captured on June 25, 1425 when Philip overran Hainault. In September Jacqueline escaped to Holland which she defended with the support of the Hoek faction. Humphrey sent her a reinforcement of 500 English, but lost interest in her fortunes after Philip had defeated her at Brouwershaven in June 1426. The pope annulled her marriage with Humphrey in January 1428. In July she was forced to sign the Treaty of Delft with Philip which authorized him to administer Holland, Zeeland, and Hainault, declared him her heir should she die childless, and allowed her only her title of countess. She also promised never to marry without Philip's consent.

In need of funds, Philip in 1430 mortgaged Holland and Zeeland to the Borsselen family. In a final effort to recover her lost inheritance Jacqueline early in 1432 secretly married its head, Frans van Borsselen, and initiated a rising in Holland against the Burgundians. Philip immediately invaded the country, captured her hus-

band and demanded as a condition of his liberation that she abdicate her three countships, retaining only her title of duchess of Bavaria. She submitted in April 1432 and two and a half years later died on her husband's estate, childless. Duke Philip of Burgundy, her heir, thus became lord of the Netherlands.

JACOBAN FURNITURE. See FURNITURE.

JACOBI, jä-kō'bī, Abraham, German-American physician: b. Hartum, Westphalia, May 6, 1830; d. Lake George, N. Y., July 10, 1919. He studied at Greifswald, Göttingen and Bonn, and graduated M.D. at Bonn University in 1851. Those were years of revolutionary ferment in Germany and Jacobi, becoming identified with the movement, was imprisoned for "high treason" at Berlin and Cologne (1851-1853). In 1853 he settled in practice in New York, where his abilities soon brought him into notice. He was appointed professor of diseases of children at the New York Medical College (1860-1865) and held a similar chair in the medical department of the University of the City of New York (1865-1870). Some years later he became professor of the diseases of children at the College of Physicians and Surgeons. He held many important appointments, and was president of the New York State Medical Society (1882); of the New York Academy of Medicine (1885-1889); in 1896 was president of the Association of American Physicians, and in 1912 president of the American Medical Association. In 1900 his 70th birthday was the occasion of a public demonstration in his honor.

Among his works are *Dentition and its Arrangements* (1862); *Infant Hygiene* (1873); *Diphtheria* (1880); *Therapeutics of Infancy and Childhood* (1895); *Aufsätze, Vorträge, und Reden* (1893); *Collectanea Jacobi*, 8 vols. (1909).

JACOBI, yä-kō'bē, Friedrich Heinrich, German philosopher and writer: b. Düsseldorf, Jan. 25, 1743; d. Munich, March 10, 1819. He was educated at the University of Geneva, and in 1764 entered upon a commercial career in his native town; after a few years he retired from business, and in 1770 became a member of the councils for the duchies of Juliers and Berg. From his university days he was actively interested in literature and philosophy, and with Wieland started a journal in which some of his own writings were first published. In 1779 he went to Munich for a short time; and in 1793 left Düsseldorf and settled in Holstein. In 1804 he was called to Munich as a member of the Academy of Sciences then newly established; from 1807 to 1812 he was president of the academy; and in 1812 retired to prepare a collected edition of his works, which, however, was not finished before his death.

His writings include two philosophical romances, *Allwells Brief-Sammlung* (1774) and *Woldemar* (1779); and the more important philosophical treatises, *Briefe über die Lehre Spinozas* (1785); *David Hume über den Glauben oder Idealismus und Realismus* (1785); *Von den Göttlichen Dingen* (1811). In these treatises he defines his theory that man's thought—or reason—is by its nature partial and limited, and can only connect facts, not explain their existence; and that the higher truths must be understood

through another different faculty which he calls "faith" or "belief" ("Glaube"), he does not, therefore, seek to establish a systematic philosophy. His theories involved him in considerable controversy, especially with the adherents of the critical philosophy. His collected works were published at Leipzig, 6 vols. (1812-1824).

JACOBI, Hermann Georg, German Sanskrit scholar: b. Cologne, Feb. 11, 1850; d. Bonn, Oct. 19, 1937. He was educated at Cologne Gymnasium, and later took up a course of studies in Sanskrit and allied languages at the universities of Bonn and Berlin. After spending a year (1872-1873) in the India office in London on the old Sanskrit manuscripts, he went to India, making a tour of Rajputana. In 1875 he became a docent in Sanskrit at Bonn; from 1876-1885 was professor extraordinarius of Sanskrit and Comparative Philology at Münster, Westphalia; in 1885 was made professor ordinarius of Sanskrit at Kiel; and in 1889 was appointed professor of Sanskrit at Bonn. He made a special study of Jainism and Prākṛit grammar, writing exhaustively on those subjects as well as on the Sanskrit poetical languages. Among the most important of his works are *The Indian Antiquary* and the *Epigraphia Indica*, published in 1892, in which he gives two sets of tables showing the Hindu dates in inscriptions.

His other works include *De Astrologiae Indicae, Horā appellatae originibus* (1872); *The Kalpasūtra of Bhadrabāhu* (1879); *The Ayaṅga Sūtra of the Cvetāmbara Jains* (1882); *Gaṇa Sūtras* (1884); *Ausgewählte Erzählungen im Māhārāshtri. Zur Einführung in das Studium des Prākṛit* (1886); *The Porisishataparvan by Hemachandra* (1891); *Sthavirāvali Charita* (1891); *Das Rāmāyana Geschichte und Inhalt, nebst Concordanz der gedruckten Recensionen* (1893); *Kompositum und Nebensatz* (1897); *Bhāsa's Svapnavasayadatta* (1913); *Die Entwicklung der Gottesidee bei den Indern und deren Beweise für das Dasein Gottes* (1923).

JACOBI, Karl Gustav Jakob, German mathematician: b. Potsdam, Dec. 10, 1804; d. Berlin, Feb. 18, 1851. He obtained his education at the University of Berlin, where he studied especially mathematics and philosophy, later in 1824 becoming a privat-docent there. In 1825 he became assistant professor of mathematics at Königsberg and in 1827 was appointed professor. He was appointed a member of the Prussian Academy of Sciences in 1836 and from 1842 till his death in 1851 lectured at the University of Berlin. His most important work was on the theory of elliptic functions, but he also made some valuable contributions to the theory of numbers and determinants.

Only a small portion of his writings and lectures were published during his lifetime and the greater part of these were published in the *Crelles Journal*. Among these are *Fundamenta Nova Theoriae Functionum Ellipticarum* (1829); *Canon Arithmeticus* (1839); *De Formatione et Proprietatibus Determinantium* (1841); *Mathematische Werke* (1846-1871). A complete edition of his works, *Gesammelte Werke*, was published in seven volumes by the Berlin Academy of Sciences (1881-1891). His *Vorlesungen über Dynamik* did not appear until 1866, long after his death, and later in 1895, his essay, *Über die vierfach periodischen Functionen*

Zweier Variabeln, was published in Latin.

JACOBI, Mary Corinna Putnam, American physician: b. London, England, Aug. 31, 1842; d. New York, N. Y., June 10, 1906. She was the first woman to graduate from the New York College of Pharmacy in 1863, and from the Woman's Medical College of Philadelphia, Pa., in 1864. After a brief period of teaching she went to Paris, France, and spent 18 months in hospitals there and was finally admitted to the École de Médecine, the first woman to be accepted by the faculty. Upon completion of her studies she returned to the United States and entered private practice and in addition lectured on therapeutics in the Woman's Medical College of the New York Infirmary. In 1873 she was married to Dr. Abraham Jacobi (q.v.). In 1874 she organized, and became president of, an association for the advancement of medical education for women. She was the first woman to become a member of the New York Academy of Medicine. Her writings on medical subjects were important. They include, *The Value of Life* (1879); *Cold Pack and Anaemia* (1880); *The Prophylaxis of Insanity* (1881); *Essays on Hysteria, Brain Tumor, and some Other Cases of Nervous Diseases* (1888).

JACOBI, yā-kō'bē, Moritz Hermann, German physicist, architect, and engineer: b. Potsdam, Germany, Sept. 21, 1801; d. St. Petersburg (now Leningrad), Russia, March 10, 1874. A brother of Karl Gustav Jakob Jacobi, he began his career as an architect but is chiefly remembered for his studies of the uses of electricity. He made his first trip to Russia at the age of 17 and was to spend much of his life in or near the imperial city of St. Petersburg.

Designing an electric telegraph in 1832, he may have been the first to suggest the so-called ground return circuit, in which ground replaces the return wire. He claimed the discovery of galvanoplasty in 1837, invented an electrotyping process in 1839, proposed the use of a copper wire of fixed dimensions as a unit of electrical resistance, and conducted fruitful researches on the operation of dynamos and motors and the application of electricity as motive power.

He was professor of architecture in 1834 at the University of Dorpat in what was then the Russian province of Estonia. From 1839 he was a member of the St. Petersburg Academy of Sciences. He left numerous scientific writings in German and French, including *Mémoire sur l'application de l'électro-magnétisme au mouvement des machines* (1835); *Die Galvanoplastik* (1840); and *Mémoire sur la théorie des machines électro-chimiques* (1851).

JACOBINS, jāk'ō-bīnz, a political party of the French Revolution founded by liberal members of the National Assembly at Versailles in the summer of 1789. Its originators were chiefly Breton deputies, hence it was first called the Club Breton, later adopting the title Société des Amis de la Constitution. Not until after the National Constituent Assembly removed to Paris in October and occupied the Palace riding-school in the rue Saint-Honoré did the members acquire their historic appellation of Jacobins. The club found convenient Paris quarters adjoining the Assembly in an old Dominican monastery, and as "Jacobin" had for centuries been a synonym for

Dominican, it was natural that opponents should refer to the new occupants flippantly as "Jacobins." The "Friends of the Constitution" soon themselves adopted the name and called their organization the Club des Jacobins.

At that early stage of the revolution the Jacobins numbered among their members the Abbé Grégoire, Mirabeau, Robespierre, the painter Louis David, Antoine Barnave, Adrien Duport, M. J. Chénier, J. F. de Laharpe—and such aristocrats of moderate views as Louis Philippe, duc de Chartres, the duc d'Aiguillon, the prince de Broglie, the vicomte de Noailles, and those brother veterans of the American War of Independence, the comtes de Lameth. Gradually the club's political tendencies became more and more radical, and the moderate members, who wished to preserve the monarchy, resigned or were expelled, some of them in 1791 founding the Club des Feuillants. The majority choosing republicanism were dominated by Robespierre and his friends.

After the fall of the monarchy, in September 1792, the club called itself the Société des Jacobins. Now the most radical and influential political machine in France, it had affiliated clubs in all, or nearly all, the departments, so that party decrees in Paris were obeyed throughout the country, the Convention itself becoming a mere tool of the Jacobins.

The soul of Jacobin leadership and of the Terror was the "incorruptible" Robespierre. His arrest by the Convention on the 9th Thermidor (July 27, 1794) foreshadowed the party's eclipse. The club was ordered closed the following November 11. The Thermidorean reaction set in and a white terror succeeded the Jacobin red. There were several attempts to revive the club under other names, but Jacobin influence declined progressively until by 1799 it had virtually disappeared.

The term "Jacobin" has ever since been used to designate a violent radical or turbulent demagogue.

Bibliography.—All histories of the French Revolution devote considerable space to the Jacobins. Their proceedings were published contemporaneously in four volumes as *Journal des Amis de la Constitution* (Paris 1793–95). The basic historical work is Aulard, F. A., *La Société des Jacobins*, 6 vols. (Paris 1889–95). See also Mallet, G., *La Politique Financière des Jacobins* (Paris 1913); Brinton, Crane, *The Jacobins* (New York and London 1930).

JACOBITE CHURCH, jāk'ō-bit, one of the Monophysite sects originating in the early Christian Church and considered heretical by both Greek Orthodox and Roman Catholic communions. Its 6th century eponymous founder was Jacobus Baradaeus (d. 578) who established it in Syria, greatly assisted by the Empress Theodora. She is said to have influenced his appointment in 543 as bishop of Edessa (modern Urfa, Turkey); thereafter he was the undisputed leader of the Monophysites (q.v.) and a zealous propagator of their doctrine. The church now has communicants in Iraq and India as well as Syria. Its rite is the Antiochene or West Syrian, and the language of the liturgy is Syriac. The patriarch of Antioch, its head, lives at Homs (ancient Emesa) in western Syria. Since the 17th century the Jacobites have been in continuing contact with Rome, and a portion of them, estimated as about half, are in communion with the pope. The head of these "Syrian Catholics," as they are called, also has the title of patriarch of Antioch; his residence is in Beirut, Lebanon. The

sect known as "Malabar Jacobites" in Malabar, India, comprise mainly descendants of 17th century Roman Catholic converts. However, a large number of 20th century Malabar Jacobites have entered into communion with Rome while retaining their liturgy and customs.

Consult Attwater, Donald, *Christian Churches of the East*, 2 vols. (St. Paul, Minn., 1947-48).

JACOBITES (from Latin *Jacobus*, i.e., James), a political party in Great Britain the members of which, after the revolution of 1688 and accession of William and Mary, continued to regard the dethroned King James II as the rightful king of Great Britain and Ireland. After James's death in exile in 1701 the Jacobites espoused the cause of his son by Mary of Modena, James Francis Edward Stuart (1688-1766), who assumed the title of James III and VIII, and was known to the supporters of the Hanoverian dynasty as the Old Pretender. His eldest son, Prince Charles Edward Stuart (1720-1788), was called by them the Young Pretender, and by his partisans the Young Chevalier and Bonnie Prince Charlie. Most romantic of all the Stuart pretenders, he captured the imagination of his fellow Scots during his attempt to regain the throne of his ancestors in the famous Jacobite rising of 1745, but he died a drunken debauchee. The Jacobites then gave their allegiance to Charles Edward's younger brother, Henry Benedict Maria Clement Stuart, Cardinal York (1725-1807), last prince of the British royal house of Stuart, who assumed the title of King Henry IX of England. Impoverished by the French Revolution, King George III took pity on this clerical claimant to his throne and granted him a substantial pension.

As a party the Jacobites won more adherents in Scotland, the homeland of the Stuarts, than in England; but they were even more strongly entrenched in Ireland because of James's Roman Catholicism, the accession of Protestant William and Mary bringing the religious issue to the fore. The first attempt of the Jacobites to restore James to the throne followed by only a few months his flight to France. King Louis XIV assisted his unfortunate cousin with a fleet and army to occupy Ireland; but after the defeat of the Franco-Irish forces at the Battle of the Boyne (July 1, 1690), no further aid was offered by Louis to the exiled king.

During the 18th century four more attempts were made at a Stuart restoration which, had any succeeded, would have brought the Old Pretender to the throne. The first of these occurred in 1708 when Comte Claude de Forbin with a small fleet attempted to convey the "Chevalier de Saint-George" (James Francis) to Edinburgh; the fleet reached the Firth of Forth but was driven away. George I, first of the Hanoverian monarchs, ascended the throne in 1714. A year later the earl of Mar headed a Jacobite rising in the north, but failed to take advantage of the synchronous risings in England of Thomas Forster and Lord Derwentwater, they too having raised the Pretender's standard. Had Mar led his Scots into England and joined the English Jacobites, the uprising might at least have attained serious proportions. As it was, both forces capitulated the same day, Nov. 13, 1715, the English at Preston and the Scottish at Sheriffmuir. After the débâcle James Francis landed, but six weeks later was obliged to return to France. The third attempted occurred in 1719 when Cardinal Giulio

Alberoni, prime minister of Spain's Philip V, sponsored an expedition which landed in Scotland. Lacking a united leadership it was easily defeated at Glenshiel on June 10.

The fourth and last of the 18th century Jacobite risings was the most famous, the "45" led by Prince Charles Edward, as his father's representative. Landing in Scotland in 1745 with only seven followers, he secured the support of the Highland chieftains who called out their clans. Perth and Edinburgh were occupied. Gen. Sir John Cope was defeated at Prestonpans on September 21, and the prince started his march on London. However, anticipated support both in the Lowlands and in England failed to materialize. On reaching Derby his generals advised a retreat. Though he gained one more victory, at Falkirk (Jan. 21, 1746), he was finally defeated at Culloden (April 16). For five months after the collapse of his cause Prince Charles lived a hunted life in the Highlands, with a price on his head, before escaping to France. The rebellion was put down with brutal severity by the duke of Cumberland, and three of the rebel lords, tried by their peers in the House of Lords, were condemned and beheaded. Many lesser leaders were hanged or transported. Antipathy to the Hanoverians diminished after the accession of George III, the first British-born sovereign of that house, and his generosity to the last surviving Stuart claimant, Cardinal York, still further diminished the numbers of Jacobite partisans. It may be said that as early as the first years of Victoria's reign Jacobitism in Great Britain had become little more than a romantic memory.

Consult Petrie, C. A., *The Jacobite Movement*, 2 vols. (London and New York 1948-50).

JACOBS, ja'kübz, **Helen Hull**, American tennis player and writer: b. Globe, Arizona, Aug. 6, 1908. Educated at the University of California at Berkeley, she was the national junior tennis champion in 1924-1925 and went on to an outstanding career in amateur lawn tennis. She was the first player to win the national women's singles crown at Forest Hills, Long Island, for four successive years (1932-1935), won the unofficial world singles title at Wimbledon, England, in 1936, where she was a finalist on six separate occasions, won several doubles and mixed doubles championships and played on the American Wightman Cup team for 13 straight years. She served as an officer in the Women's Naval Reserve during World War II and was the author of several books and magazine articles about tennis.

JACOBS, ja'kübz, **Henry Eyster**, American Lutheran clergyman and theologian: b. Gettysburg, Pa., Nov. 10, 1844; d. Philadelphia, July 7, 1932. He was graduated from Pennsylvania College (Gettysburg) in 1862, and from the Lutheran Theological Seminary at Gettysburg in 1865. From 1864 to 1867 he was a tutor at Pennsylvania College, and from 1867 to 1868 home missionary in Pittsburgh. He was principal of Thiel Hall, Water Cure, Beaver County, Pa., from 1868 to 1870. He was professor of Latin and history in Pennsylvania College in 1870-1880, of ancient languages in 1880-1881, and of Greek in 1881-1883. He was professor of systematic theology, Lutheran Theological Seminary, after 1883; dean, 1894-1920; president, 1920-1927; and emeritus thereafter. He was president of the Board of Foreign Missions of the General Council of the Lutheran

Church (1902-1907); and president of the General Conference of Lutherans (1899, 1902, and 1904). His writings covered various phases of religion and church history, including *A History of the Lutheran Church in America* (1893); *Life of Martin Luther* (1898); and *The German Emigration to America, 1709-1740* (1899).

JACOBS, William Wymark, English writer: b. London, England, Sept. 8, 1863; d. there, Sept. 1, 1943. While working as a post office clerk he wrote humorous short stories, many of them centering about the locale of the London docks which he knew as a boy. At first the stories appeared in the magazines *Idler* and *Today*, but Wymark's first collection, *Many Car-goes* (1896), was successful enough for him to leave the civil service and devote himself to writing. Among his later books, chiefly collections of short stories, were *The Skipper's Wooing* (1897), *Sea Urchins* (1898), *The Lady of the Barge* (1902), *Captains All* (1905), *Night Watches* (1914), and *Sea Whispers* (1926). An omnibus of previously published stories, *Snug Harbor*, appeared in 1931. Of all the narratives, Jacobs' best is a tale of horror, *The Monkey's Paw* from *The Lady of the Barge*; it was dramatized in 1904 as a one-act play by Louis Parker. Jacobs himself wrote a few short plays, some of which were based on his stories. He has been called "the O. Henry of the waterfront."

JACOB'S LADDER, jă'kûzb lăd'ēr, a common name for species of *Polemonium*, a genus of some 30 species of usually perennial herbs in the family Polemoniaceae, widely distributed in the northern hemisphere and southward to Chile in the Americas, and especially the common garden species, *P. caeruleum*. This species is an erect plant 8 to 30 inches tall, with a hollow, angled stem and alternate, pinnately compound leaves with about 27 leaflets each. It bears many blue, bell-shaped flowers, each nearly an inch long, in a terminal panicle. There are five lobes on the calyx and corolla, five stamens, and a three-parted ovary. It is a hardy plant useful for rock gardens and borders.

RICHARD M. STRAW.

JACOBSEN, yă'kôp-s'n, Jens Peter, Danish novelist: b. Thisted, Denmark, April 7, 1847; d. there, April 30, 1885. He entered Copenhagen University in 1867 to study the natural sciences, but writing claimed much of his attention. In 1869 he had written a volume of poetry, which, however, remained unpublished until its inclusion in the posthumous *Digte og udkast* (*Poems and Sketches*, 1886; the *Poems* in Eng. tr., 1920). About 1870 he became interested in the theories of Charles Robert Darwin and in 1872 published a translation of Darwin's work, *On the Origin of Species by Means of Natural Selection*, following it with a translation of *The Descent of Man* in 1874 and 1875. Although he had been reared in Christianity, he began to question religious belief and finally became a complete atheist.

In 1873 it was discovered that Jacobsen had contracted tuberculosis, and he was given two years to live. By conserving his strength he stretched the allotted time to over 11 years, during which he abandoned science, confined himself to writing, and became one of the foremost exponents of the naturalistic movement in Danish

literature. In 1876 appeared *Frû Marie Grubbe* (Eng. tr., *Marie Grubbe*, 1914), a historical romance. His second and last novel, *Niels Lyhne* (1880; tr. into English as *Siren Voices*, 1896, and *Niels Lyhne*, 1919), was a study in the decadence of an individual, a man who, like Jacobsen, was an atheist. His complete works were published posthumously as *Samlede værker*, 5 vols. (1924-29). Jacobsen was one of Denmark's foremost prose stylists, clothing the most minute descriptions in the most exquisite lyricism, possessing great sensitivity and analytical power. See also DANISH LITERATURE.

Consult Gustafson, Alrik, *Six Scandinavian Novelists* (New York 1940).

JACOBUS DE VARAGINE or **VORAGINE**. See GOLDEN LEGEND.

JACOPONE DA TODI, yă-kô-pô'nâ dă tō'dé (originally JACOPO DEI BENEDETTI), Italian friar and religious poet: b. Todi, Italy, about 1230; d. Collazone, near Perugia, Dec. 25, 1306. A wealthy and successful lawyer, in 1268 he abandoned his profession after his wife's death, gave his property to the poor, and adopted a life of penance, attacking from time to time the licentiousness of the age. In 1278 he became a lay brother of the Order of St. Francis. Siding with the Colonna faction against Pope Boniface VIII, he was taken captive in 1298 and imprisoned until the death of Boniface in 1303. A collection of Friar Jacopone's hymns, *Laude di Frate Jacopone da Todi*, was published in 1490 (reprinted 1910, 1915; rev. ed., 1930). In addition, he is the reputed author of the well-known hymn, *Stabat mater dolorosa*.

Bibliography.—Selected *Laude*, in English as well as the original Umbrian dialect, appear in Evelyn Underhill's biography, *Jacopone da Todi: Poet and Mystic* (London 1919). A fictionalized biography is Helen C. White's *A Watch in the Night* (New York 1933).

JACOTOT, zhă-kô-tô', Jean Joseph, French educator: b. Dijon, France, March 4, 1770; d. Paris, July 30, 1840. Educated at the University of Dijon, he was appointed professor of Latin there in 1789. In the French revolutionary wars he took part in the Belgian campaign of 1792, after which he taught science, mathematics, and Roman law in various institutions. After the final overthrow of Napoleon I he left France for Brussels, where in 1818 he was chosen to teach French at the University of Louvain. Here he perfected the educational method with which he had been experimenting, a system which he described in *Enseignement universel* (*Universal Instruction*), a five-part work published between 1823 and 1839, including methods for learning one's native tongue, foreign languages, the arts (music, design, painting), mathematics, and law and philosophy. He returned to France after the revolution of 1830.

Jacotot's first principle is that all are equal in intelligence; the second, that every person is able to instruct himself, if he will; and the third, that one may learn an entire subject from its parts. Thus, in learning a new language the student might study for himself a short passage: first, the words, then the letters, then the grammar, then the meaning.

JACQUARD, zhă-kâr', Joseph Marie, French inventor: b. Lyon, France, July 7, 1752; d. Oullins, Aug. 7, 1834. As a child he assisted

his father, a weaver in a silk mill. Resolving to make improvements in the loom then in use, in later years he worked at Lyon on an improved model, which he exhibited in Paris at the Industrial Exhibition of 1801. After further improvements had been made at Paris, his perfected loom was bought in 1806 by the state and was declared public property, Jacquard being given an annuity and a royalty on all looms sold. He had eliminated the apparatus of loops and pedals operated by several workers and substituted a simple mechanism which one weaver alone could operate, to weave even the most complex designs. The invention was opposed by the French silk weavers, who feared unemployment, but it was soon generally adopted in France. It is the basis for many adaptations in modern textile weaving. See also WEAVING, HAND LOOM.

JACQUERIE, zhāk-rē', a peasant insurrection against the nobles of France, taking place in 1358 during the period of the Hundred Years' War with England. The name may have come from the word *jacque*, a kind of garment, or from the nickname of the leader, Guillaume Caillet (Cale), called by his men Jacques Bonhomme. More probably it came from the fact that the nobility referred scornfully to a peasant as Jacques. The main cause of the rebellion was the excessive misery caused by the ravages of wandering soldiery, both French and English, after the disastrous Battle of Poitiers in which John II of France was taken prisoner. In this situation the nobles, instead of protecting the peasants, allied themselves with the brigands.

The Jacquerie started in Beauvaisis (Beauvais), then spread to all parts of the Île de France, Picardy, and Champagne. It was conducted with extreme ferocity, many castles being sacked and burned by the peasants. The nobles united with the bourgeois of the towns in a campaign to exterminate the rebels, of whom 7,000 were killed at Meaux by forces under the leadership of Captal de Buch and Gaston III Phoebus, comte de Foix. Bloody reprisals quickly ended the revolt.

PIERRE BRODIN.

JACQUES-CARTIER, zhāk kār-tyā', city, Quebec, Canada, in Chambly County on the right bank of the St. Lawrence River opposite Montreal. It is almost wholly residential, owing its recent growth and incorporation to the expansion of Montreal. Industrial products include processed foods, aircraft engines, and diesel motors. Pop. 40,807.

JADE, yā'dě, a bay of the North Sea, on the north German coast just west of the Weser estuary. Covering an area of over 70 square miles, it was formed by floods in the 13th and 16th centuries. Although shallow at low tide, the bay may be entered by large ships when the tide is high. Its narrow mouth is constantly being widened by storms and erosion. At the west side of the entrance lies Wilhelmshaven, formerly important as a German naval base.

JADE, jād, a name used to designate either of two distinct minerals, jadeite and nephrite, which have been worked into tools by prehistoric peoples in Europe, Asia, and America, and into gems and ornaments in historical times by the Chinese, the Aztecs, the Mayas, and the Maoris of New Zealand. Nephrite is a calcium-mag-

nesium silicate of the amphibole group, having a specific gravity of 2.9 to 3.1; jadeite is a silicate of sodium and aluminum, a pyroxene with a specific gravity close to 3.33. Both are tough, cryptocrystalline materials ranking for hardness at 6½ to 7 on the Mohs scale. When free from extraneous chemicals, both are white, and the great range of shades of green, brown, mauve, blue, yellow, red, gray, and black is accounted for by the presence of various compounds of iron, chromium, or other elements, usually in very small quantities. Nephrite is really a compact

form of the mineral tremolite or, when iron is present, of actinolite, otherwise known as amphibole asbestos. Specific gravity or other tests are sometimes necessary to identify worked jade as nephrite or jadeite.

The world's best-known deposits of nephrite are in the region of Khotan and Yarkand in central Asia; these have long been China's main source of supply, but in later times have been supplemented from deposits near Lake Baikal in Siberia. China's jadeite is imported from Upper Burma, overland or by sea via Rangoon. The popular apple-green Chinese jewelry jade is made of Burma jadeite. Both minerals have been located in Europe and in North America: jadeite in Guatemala and California, and nephrite in Alaska, British Columbia, California, and Wyoming, where the discovery of a great deposit was reported in 1939. The presence of jadeite in Japan also has been confirmed.

Jade stones, being too hard to be cut by steel, are worked with abrasive sands, chiefly quartz, crushed garnets, and corundum, or in modern times with carborundum. They take a very attractive and durable polish. The carving technique is laborious and makes great demands on the craftsman's patience. Remarkable feats of jade carving were achieved by Aztecs, Mayas, and Maoris with natural abrasives and without the aid of metal tools.

However, it is especially with China that jade carving is associated, for in no other land has this unyielding material been worked so skillfully and in such a long and continuous tradition. From the dawn of their civilization the Chinese have regarded jade as a most precious substance, supremely appropriate for religious objects and for royal and aristocratic insignia and endowed with magical powers of healing and preserving the body and of purifying the mind. Many ancient Chinese jades dating from the 2d millennium B.C. onward are to be seen in leading art museums of the world. The craft of the jade carver came to enjoy a status comparable to that of the goldsmith in the West and had reached a high degree of maturity by the 3d century B.C. The stone became a recognized medium of artistic expression, and exquisite carvings have been produced down to modern times.

Since the discovery in Wyoming, jade has increasingly attracted the attention of lapidaries in the United States, and of at least one sculptor of note, Donal Hord of San Diego, Calif.

S. HOWARD HANSFORD,
*Professor of Chinese Art and Archaeology in the
University of London.*

JAEGER, yā'gēr, a large sea bird related to the gulls, but placed in a separate subfamily, the Stercorariinae, which consists of four species inhabiting the northern seas and the Antarctic. Jaegers vary from about 17 to 22 inches in size and are brown and white in coloration. Their central tail feathers are elongated and their wings are very long and pointed. They are bold and predatory and are equipped with strongly hooked bills and sharp falconlike claws. They occupy at sea the ecological niche occupied by hawks and falcons on land. Three species are found in American waters: the long-tailed (*Stercorarius longicaudus*), the pomarine (*S. pomarinus*), and the parasitic (*S. parasiticus*). See also SKUA.

CHARLES VAURIE.

JAEGERs, yā'gerz, Albert, American sculptor: b. Elberfeld (now part of Wuppertal), Germany, March 28, 1868; d. Suffern, N.Y., July 22, 1925. As a boy he came to the United States. Self-taught in his art, he carved statuary for the Buffalo and St. Louis expositions in 1901 and 1904, also for the Fine Arts Building, St. Louis, and the New York Custom House. By commission of the United States government he executed his best-known monument, that of the Revolutionary hero Baron Friedrich Wilhelm von Steuben in Washington, D.C.

JAEL, jā'ēl, or **JAHEL**, in the Bible, wife of Heber the Kenite and slayer of Sisera, commander of the Canaanites (Judges 4:17-22). The song of Deborah the prophetess praises Jael as "blessed above women" (Judges 5:24-27).

JAEN, hā-ān', province, Spain, part of the Andalusian region in southern Spain. It is bounded by these provinces: on the north by Ciu-

dad Real, on the northeast by Albacete, on the southeast by Granada, and on the west by Córdoba. Its area of 5,209 square miles is traversed by several mountain ranges, including the Sierra Morena to the north, and by the Guadalquivir and Segura rivers.

Jaén's most important industry is mining, the lead mines in the Sierra Morena being the richest in Europe, and there are also iron, copper, gypsum, salt, limestone, and marble. The mining district is served by a network of railways, centering at Linares, the heart of the mining and metallurgical industries. Next in importance is agriculture, carried on in the river valleys and the central and northwestern plains, where the climate is moderate to hot and there is sufficient rainfall. Olive trees, grown in the fertile Guadalquivir Valley, account for one third of Spain's olive oil production, and there are also vineyards, fruit orchards, cereals, esparto grass, vegetables, and tobacco. Another activity of some importance is stock raising, including the breeding of fine horses. Jaén's industries consist chiefly in processing her mineral and agricultural products. The capital of the province is Jaén (q.v.), other important cities are Úbeda, La Carolina, and Andújar. Pop. (1950) 765,697.

JAEN, city, Spain, located about 40 miles north of Granada and 50 miles west of Córdoba. Capital of the Province of Jaén (q.v.), the city is picturesquely situated on a wooded mountain slope, rising in terraces high above the valley of the Guadalbullón River, a tributary of the Guadalquivir. It is a trade center for the products of the region, especially olive oil. In addition, Jaén has liquor distilleries, tanneries, and manufactures of iron oxide, fertilizers, colored tiles, hemp rope, furniture, hats, and flour products. Limestone and gypsum are quarried nearby. The city lies on a branch railroad connecting with Córdoba and other important centers.

Jaén was founded by the Romans. In the 8th century A.D. it was conquered by the Moors, under whose rule it was the capital of a small principality. Ferdinand III of Castile took the city in 1246. It still retains its narrow, winding streets, the remains of Moorish walls, and the ruined Moorish citadel dominating it. Jaén's large Renaissance cathedral was built during the 16th to 18th centuries. Pop. (1950) 61,610.

JAFFA, jāf'ā (ancient JOPPA; Arab. YAFA), town, Israel, combined in 1950 with Tel Aviv (q.v.), which it adjoins to the south. It is situated in the Plain of Sharon, on the Mediterranean Sea, 34 miles northwest of Jerusalem, whose port it was from ancient times. Jaffa, which appears in history as early as the reign (1490-1436 B.C.) of Thutmose III of Egypt, was taken by the Israelites under King David in the early 10th century B.C. and retaken by Simon Maccabaeus (after 142 B.C.) when the Greek domination ended. It is famous in the Old Testament as the place where Jonah (1:3) embarked on his fateful voyage, and in the New Testament as the place where Peter raised Dorcas from the dead (Acts 9:36-43) and had his vision concerning the clean and the unclean (10:1 ff.).

Jaffa was captured by the Crusaders in 1126 and changed hands several times until it finally fell to the Saracens 70 years later. Eventually it passed to the Turks, who lost it to the British in 1917. Thereafter it was included in the Brit-

ish mandate of Palestine until taken by the Israelis during their struggle for independence in 1948. Most of the previously large Arab population of Jaffa was resettled elsewhere thereafter.

JAFFNA, jăf'nâ, town, Ceylon, situated near the northern tip of the island on the southwest coast of Jaffna Peninsula, on Jaffna Lagoon, 240 miles north of Colombo by road and railway. It is the capital of the Northern Province and the Jaffna District and also a small port and market place for grain, tobacco, coconut, palmyra fiber, and mangoes. Turtles, chank shells, and trepangs are taken in the local waters. Jaffna Peninsula is a low limestone plain, intensively cultivated with rice and other crops. The climate is hot and the rainfall is low, but despite these handicaps it is Ceylon's most heavily populated area with the exception of the Colombo area.

The region of Jaffna was settled by Tamils from India before the beginning of the Christian era. In 1544 Roman Catholic missionaries came here; in 1617 the town was captured by the Portuguese and in 1658 by the Dutch. The town was occupied by the British in 1795 during their conquest of Ceylon. Pop. (1953) 77,218.

JAGANNATH or **JUGGERNAUT**. See **PURI**.

JAGATAI, jăg-â-tî', or **CHAGATAI**, chăg-â-tî', Mongol ruler; d. 1242. The second son of Genghis Khan (q.v.), he commanded armies for his father. In 1227, by his father's will, he received territory in central Asia roughly corresponding to the region of Turkestan, but in 1229 he recognized his younger brother Ögödei as the khan, his father's successor, and served as his adviser. Among his descendants was Tamerlane.

JAGELLON, yă-gěl'ün, name of the second Polish dynasty, founded in 1386 with the marriage of Queen Jadwiga (r. 1384-1399), daughter of Louis I of Hungary and Poland, with Jagello, grand duke of Lithuania, who ruled Poland as Ladislas II or V (r. 1386-1434). The successors of Jagello were Ladislas III or VI (r. 1434-1444), Casimir IV (r. 1447-1492), John Albert (John I, r. 1492-1501), Alexander (r. 1501-1506), Sigismund I (r. 1506-1548), and Sigismund II (r. 1548-1572), who was the last of the direct line. Catherine, sister of Sigismund II and wife of John III of Sweden, was the mother of Sigismund III, King of Poland (r. 1587-1632), who was succeeded by his sons, Ladislas IV or VII (r. 1632-1648) and John II Casimir (Casimir V, r. 1648-1668).

During the reign of the Jagellon dynasty Poland, in combination with Lithuania, became a great power. Owing chiefly to the efforts of Jagello (Ladislas II) and his son, Casimir IV, the power of the Teutonic Knights was broken, West Prussia being taken from them by the Second Peace of Thorn (1466), while East Prussia remained only as a fief of the Polish crown. The period also produced a golden age for Polish culture and intellectual activity. Jagellon prestige was such that the son of Casimir IV was elected king of Bohemia as Ladislas II (r. 1471-1516) and of Hungary (r. 1490-1516). His son, Louis II (r. 1516-1526) was the last Jagellon in Hungary and Bohemia. See **BOHEMIA—History**; **HUNGARY—History**; **POLAND—History**.

JAGERNDORF. See **KRNOV**.

JAGERSFONTEIN, yă'kërs-fôn-tân', town, Union of South Africa, located in the Orange Free State 70 miles southwest of Bloemfontein. It is the site of an important diamond mine, the first diamond having been discovered in 1878. Among the famous diamonds found here were the Excelsior in 1893, a stone of 971 carats, and in 1895 the Jubilee, a flawless white stone of 634 carats. The mine was closed in 1932 due to depressed world economic conditions, but it was reopened in 1949. Gold has also been discovered nearby. Pop. (1951) 5,164; with adjacent mine compound, 7,051.

JAGGARD, jăg'êrd, William, English printer; b. about 1568; d. 1623. He printed various unauthorized editions of William Shakespeare's poems, the first of which was *The Passionate Pilgrime* (1599), although many of the poems were actually by others. Appointed about 1610 as printer to the city of London, he became blind shortly thereafter, but this misfortune did not deter him from success. He continued to pirate Shakespeare's work with an edition of the plays (1619), containing some which were not by Shakespeare. However, he is known chiefly as the publisher of the first folio edition of Shakespeare, *Mr. William Shakespeares Comedies, Histories, & Tragedies*, which appeared in 1623 after Jaggard's death. Eighteen of the plays appeared for the first time in this publication, and important textual corrections were made in those which had been published in earlier (quarto) editions.

Consult Willoughby, Edwin E., *The Printing of the First Folio of Shakespeare*, Supplement to the Bibliographical Society's Transactions, No. 8 (London 1932); id., *A Printer of Shakespeare* (London 1934).

JAGUAR, jăg'wâr or jăg'û-âr (*Felis onca*), the largest cat of the New World, distinguished by its grayish or tawny coat characteristically spotted with black. It ranges from north of the Mexican boundary, in Texas, New Mexico, and Arizona, southward through Mexico and Central and South America as far as northern Argentina where the pampas begin. The common Latin American name for the beast is *tigre* (tiger). The term jaguar is a corruption of the Indian *yaguar* or *yaguareté*.

A fully developed male may attain a combined head and body length of 6 feet, a tail length of 2½ feet, and weigh up to 400 pounds. As compared with the puma (q.v.), which nearly equals it in size, the jaguar is robuster and more heavily built, especially around the forequarters, and its head is proportionately larger. The ground color of the body, ranging from grayish to tawny, is marked with a pattern of spots and irregular stripes. The spots of the head and fore and hind limbs are solid and arranged individually; those of the body are grouped to form rosettes, each enclosing a dark patch that may be dotted with one or two small spots. The chest and throat are whitish and marked with irregularly traced transverse stripes, the belly is blotched, the tail is banded with broad stripes terminally and with blotches toward the base. The ears on the inner side are white; on the outer, black with a whitish or yellow spot.

The jaguar is the largest, most powerful, and most feared carnivorous animal of Latin America. Except for man, it has no enemies, and before

the introduction of firearms even man did not always command the respect of the cat. Nevertheless, jaguars rarely attack man unprovoked and almost never become man-eaters, as do individual lions, tigers, and leopards. The abundance of peccaries and capybaras—and the ease with which these animals can be killed—keeps the jaguar well fed during most of its natural life. Deer, tapir, and crocodiles are also preferred prey, but any animal regardless of size may be eaten by a hungry *tigre*. Older jaguars, no longer agile enough to make easy kills of elusive wild game, may attack domestic stock, especially pigs. In villages where there are no firearms or other weapons which the jaguar has learned to fear, it shows its contempt for man by entering huts and carrying off dogs and even children and old people. The jaguar is nearly as strong as the lion or tiger and can drag a horse or a cow over rough terrain for great distances to a secluded place where the victim can be devoured without disturbance. It takes readily to water and swims easily, even with a tapir or cow clasped between its jaws. It fishes by reclining along the edge of a stream or lake, swiftly striking and hooking with its claws any passing fish or turtle. It is said that the jaguar taps the surface of the water with its tail to lure fish within striking distance.

Jaguars are generally nocturnal, but may be active during the day, especially during the breeding period. They climb well, but older or heavier cats remain on the ground unless treed by dogs trained especially for hunting them. They breed once a year, but, evidently, during no particular season. The period of gestation varies from 13 to 15 weeks, the longer time being taken by females in captivity. Two to four cubs are produced at a birth and they are generally weaned and set adrift at an early age. Adult stature is acquired at 3 years of age and an individual jaguar may live for 20 years.

PHILIP HERSHKOVITZ,
Chicago Natural History Museum.

JAGUARUNDI, jä-gwà-rün'dī, or **YA-GUARUNDI** (also called EYRA), a small American wildcat slightly larger than a domestic cat and characterized by an unspotted coat and narrow face. The jaguarundi (*Felis jagouarundi*) owes both its common and scientific names to a Gallic corruption of the original Guarani Indian term *yaguarundis*. The species ranges from the Mexican border in the United States southward into northern Argentina. Individual jaguarundis appear in either a dark gray color phase or a reddish color phase. This dichromatism has misled some into believing that each color phase represents a distinct species. The jaguarundi has a keener appetite for birds than for any other kind of game. It is remarkably astute in raiding hen houses and, seemingly, can sense exactly when and where to make the attack without being detected by man until it is too late. The cat never kills more than it can eat and steals one hen daily until the henery has been depleted. The jaguarundi is active during the day and, apparently, less given to climbing than are its spotted relatives. See also CAT.

PHILIP HERSHKOVITZ,
Chicago Natural History Museum.

JAHANGIR, jä-hän'gēr, or **JEHANGIR**, emperor of Hindustan: r. 1605–1627; b. 1567; d.

October 1627. Fourth emperor of the Mogul dynasty, he succeeded his father, Akbar (q.v.) the Great, in 1605. Named Selim, after his accession he took the title of Jahangir (Conqueror of the World). He was a weak and tyrannical ruler, who was able to maintain his father's empire and to suppress the rebellion of his son, Prince Khusru, but could not add to the empire. Jahangir was the first Mogul to receive a trade mission from Great Britain. His strong-willed empress, Nur Jahan, gradually secured the reins of government, while Jahangir indulged his taste for art, literature, and drink.

See also INDIA—17. History: 6th Century B.C.—1707.

JAHN, yän, Friedrich Ludwig, German patriot and gymnastic director: b. Lanz, Germany, Aug. 11, 1778; d. Freyburg an der Unstrut, Oct. 15, 1852. After studying theology and philology at Halle, Göttingen, and Greifswald, in 1809 he became a teacher at Berlin. In 1811, with the purpose of strengthening German youth and consolidating national resistance to Napoleonic rule, he opened in Berlin the first Turnplatz, or outdoor gymnasium, and from this developed a gymnastic association (Turnverein) throughout Germany. Jahn himself is often called the *Turnvater* (Father of Gymnastics). Jahn's young gymnasts volunteered for the army in large numbers. After the defeat of Napoleon in 1815, Jahn was appointed state teacher of gymnastics and, as such, he was influential in the Burschenschaft (q.v.) movement. However, his liberal political views resulted in the closing of the Turnplatz and Jahn's imprisonment (1819–1825) by the reactionary Prussian government, and, even when released, he was forbidden to live within 10 miles of Berlin. After the revolution of 1848 he was elected a member of the general German parliament at Frankfurt am Main, which attempted in the years 1848–1849 to create a government for a united Germany. Features of Jahn's gymnastic training have persisted in more recent German nationalist movements, including that of National Socialism. See also GYMNASTICS, HISTORY OF; PHYSICAL EDUCATION—Modern Revival (Germany and Slavic Countries).

JAHN, Otto, German classical philologist, archaeologist, and musicologist: b. Kiel, Germany, June 16, 1813; d. Göttingen, Sept. 9, 1869. He was professor of archaeology at the universities of Greifswald (from 1842) and Leipzig (from 1847), but was dismissed from the Leipzig post because of his activities in the German revolution of 1848. From 1853 to 1867 he served as professor of classical philology and archaeology at Bonn. Although called to a chair in Berlin in 1867, he was prevented by poor health from entering upon his new duties.

Jahn was a many-sided scholar, a prolific writer on classical philology, music, and classical archaeology. In archaeology he laid stress on exact and scientific method, in opposition to the symbolical school of interpretation represented by such archaeologists as Eduard Gerhard (1795–1867). He prepared many editions of classical authors, including *Juvenal* (1851) and *Florus* (1852). Among his numerous other works are: *W. A. Mozart*, 4 vols. (1856–59); 6th ed., 2 vols. (1923–24); Eng. tr., *Life of Mozart* (1891); *De antiquissimis Minervae simulacris Atticis* (On the Oldest Attic Representations of Minerva, 1866);

Gesammelte Aufsätze über Musik (1866); *Biographische Aufsätze* (1866); *Griechische Bilderchroniken* (1871).

JAI ALAI. See PELOTA.

JAINISM, jī'nīz'm, is one of the many religions of India, followed by only about one million people, mostly in the northwest region. It closely resembles Buddhism, being a reaction contemporary with it in the 6th century B.C., from the precedent Brahmanism. These revolts arose from several causes: (1) the Kshatriya (warrior caste) sought release from the religious domination of the Brahman (priest caste); (2) Kshatriya philosophy rejected the Vedic deities; (3) the doctrine of noninjury. This last item gave to Jainism its outstanding trait. Softened by a tropical climate, humanized by a settled life in place of the old nomadic one, and driven by economy to abandon animal food, Indians had become increasingly reluctant to kill animals, except that the Brahmins naturally still demanded them for sacrifice. This practice was condemned by the Jains, who then proceeded with that extravagance characteristic of every Indian activity to spare all animal life whatsoever, even when noxious. To that end, the Jaina monk is equipped with a broom to sweep insects from his path, and a veil to sift them from his mouth, besides the inevitable almsbowl. Nor may he kill or disturb insects feeding upon his body. Moreover, Jains support beast-hospitals in many cities of western India, where old or lame buffaloes, cows, goats, sheep, fowl, and hordes of vermin are housed and fed.

Jainism was founded in the 6th century B.C., by Nataputta, entitled by his followers Mahavira (Great Hero) and Jina (Conqueror). The son of a chieftain, he led a worldly life until at 30, upon the death of his beloved parents, he was so agitated by the seriousness of life that he left his wife and relatives and wandered naked as a homeless ascetic. For 12 years he practiced the severest austerities with deep meditation, and was never moved to anger, though beaten by sinful men. Thus did he become the Jina (Conqueror) and Kevalin (Perfect Sage).

The Jaina monk attains deliverance for his spirit from the bonds of flesh by following the *triratna* (three jewels): knowledge, faith, and virtue.

This knowledge teaches that the world consists of eternal spirits and eternal atoms, without any supreme being. Eight re-births, after becoming a Jaina monk will secure the spirit's release from matter; not for absorption into the absolute—as Brahmanism taught—nor for annihilation in Nirvana—as Buddhism taught—but for something beyond human speculation; so that the Jaina was termed "the may-be philosopher." Such agnosticism has never flourished among the credulous, imaginative Indians, who, moreover, lack the mental discipline afforded by science. The second jewel is faith which reposes in the word of their master, Mahavira, and the declarations of their scriptures, the Agamas. Virtue, the third jewel, consists of the five-fold conduct that results from such knowledge and such faith, namely: (1) to kill nothing whatever; (2) not to lie; (3) not to steal; (4) to abstain from sexual pleasures; (5) to renounce all the attachments of the senses. "What is discontent and what is pleasure? One should live subject to neither. Giving up all

gaiety, circumspect, restrained, one should lead a religious life. Man! Thou art thine own friend; why lookest thou for a friend beyond thyself?"

Seven sects are classed as Svetambara (white-attire) in contrast with the Digambara (sky-attire) who migrated to the South where a more equable climate allowed them to make compulsory that nakedness which had been only recommended in the earlier texts. These may be the gymnosophists mentioned by Greek historians, but nowadays they merely doff their upper garments during meals. There are other Indian ascetics, however, who still discard clothing, and are generally countenanced.

This monk-regimen was much tempered for the Jains laity, who in fact, were mostly prosperous tradespeople, farming being prohibited by the non-injury doctrine. But, furthermore, this extension of Jainism to include laity introduced two important changes in the religion. First, to meet the religious needs of common folk, a worship of the founder, Jina, was instituted with temples, idols, festivals, and offerings of flowers and incense. Second, the monks were compelled to abandon their homeless wanderings, in order to care for the souls of their resident laity. This, in turn, led to the erection of temples, the most costly and delicately beautiful in all India, as at Mount Abu, and the erection of cloisters where the leisured monks produced a varied literature. Thus does Nature, though expelled with a pitchfork, return in the end. Unlike Buddhists, the Jains maintain caste, some of them being even Brahmins.

EDMUND BUCKLEY.

JAIPUR, jī'pūr, or **JEYPORE**, city, Union of India, capital of the state of Rajasthan, 140 miles west of Agra. It is the only city in India laid out in rectangular blocks. The city contains the palace of the maharaja of the former state of Jaipur, several colleges, and a notable open-air observatory. Manufactures include silk and cotton textiles, pottery, and brass and lacquer work. The city was founded in 1728 by Maharaja Jai Singh II to supplant Amber, 5 miles to the north as capital of the state; the state came under British protection in 1818. Pop. (1941) 175,810.

JAIR, the name of several men mentioned in the Old Testament. The most important of that name judged Israel 22 years. He is said to have had 30 sons who rode on 30 ass colts. Considerable discussion has arisen among commentators because of the attempt made to distinguish the Jair mentioned in the Hexateuch from the Jair of the book of Judges.

JAIRUS, jā'ī-rūs, in the New Testament the name of a certain ruler of a synagogue whose home was not far from Capernaum. He had a daughter 12 years old who became critically ill, lying at the point of death. He sought Jesus in order that he might exercise his healing power. Jesus at once accompanied the anxious father. Before the home was reached, a messenger met them announcing the child's death. When they arrived at the home, Jesus said, "She is not dead but sleepeth." The professional mourners were sent from the room after ridiculing the statement. The parents and three disciples were detained. He then went to the bed, took the child by the hand and pronounced two Aramaic words *Talitha Cumi* or "daughter arise," and "she arose and walked" (Mark 5:22-43; Luke 8:41-56).

JAISALMER, jī'sāl-mēr, town, Union of India, in Rajasthan 140 miles west-northwest of Jodhpur. It was formerly the capital of the Indian state of Jaisalmer. The state, 15,980 square miles in area, lay within the great Indian desert. Lack of rainfall and permanent streams makes agriculture almost impossible, the inhabitants depending mainly on livestock for their sustenance. In 1156 a Rajput ruler built the fort around which grew the town of Jaisalmer. Pop. (1941) 7,120.

JAJCE, yī'tsē, town, Yugoslavia, 62 miles by rail southeast of Sarajevo, occupying a hill overlooking the picturesque Pliva River where it falls 100 feet into the Vrbas River. A series of small lakes and cascades along the course of the Pliva through miniature gorges and tree-clad mountains, with the main fall at Jajce, are utilized for industrial purposes without detracting from the natural scenic beauties of the neighborhood. The "Lake Fort" or Turkish Djöl Hissar, at Jezero, lies five miles west of Jajce. A 14th century fortress crowns Jajce hill. The 15th century church of Saint Luke with a fine Italian campanile is said to cover the traditional grave of the evangelist. In the church are preserved and exhibited the casket and skeleton of the last king of independent Bosnia, Stefan Tomasevic, who was flayed alive by the Turks and beheaded in Kraljeva Polje, the "King's Field" just outside the walls. During the Moslem invasion of Europe in the 15th century, the districts of Jajce and Srebrenica, organized as the banate or kingdom of Bosnia, and garrisoned by Hungarians, fiercely opposed the Turks as the outpost of Christendom. In 1528, two years after the defeat of the Hungarians at Mohacs, Jajce surrendered to the Turks, who held it until the annexation of Bosnia and Herzegovina by Austria in 1908. Pop. (1931) 7,515.

JAKARTA. See DJAKARTA.

JAKOBHAVN, yā-kōps-houn', Danish settlement on the west coast of Greenland, situated on an inlet of Disko Bay. Established in 1741, it was named for Jakob Severin, a leading trader in Greenland. Fishing is the principal means of livelihood for the inhabitants. Pop. 681.

JALAL-AD-DIN or **JELAL AD-DIN**, jā-lā'loōd-dēn', shah of Khwarazm: d. 1231. In 1220 he succeeded his father, Ala-ad-Din Mohammed, who had overrun most of Persia before coming into conflict with the forces of Genghis Khan. Jalal-ad-Din, forced to flee from Persia, sought refuge in India and was brought to battle on the banks of the Indus. Once more defeated there by Genghis Khan, he fled to Delhi and for a time was safe. He regained some portions of his khanate but again the Mongols defeated him, and his life was terminated by assassination.

JALAL-UD-DIN MUHAMMAD. See AKBAR.

JALAL-UD-DIN RUMI, jā-lā'loōd-dēn'-rōō'mē, Persian philosopher: b. Balkh, Khorasan, 1207; d. 1273. His father was a scholar and carefully educated the son, who also was educated at Aleppo and Damascus. In 1231 he was made director of a college at Konieh in Asia Minor. He gradually developed into a mystic. He founded

an order of dervishes in 1247 for whom he wrote a collection of rules entitled *Mathnawi*. The *Divan* is a lyrical collection of great poetic merit. This philosopher was the first to teach the transmigration doctrine.

Consult Browne, Edward G., *Literary History of Persia* (New York 1906), and Davis, *The Persian Mystics* (New York 1908).

JALALABAD or **JELALABAD**, jā-lāl'ā-bād, town, Afghanistan, on the Kabul River 70 miles east of Kabul and 80 miles west of Peshawar. Situated west of the Khyber Pass and commanding the valley of the Kunar northward to Kabul, it is of considerable strategic importance. Baber, the Mogul emperor, chose the site as a defensive point, but it was not until 1560 that the town was built by Akbar, his grandson. During the First Afghan War (1841-1842) Jalalabad was captured by the British, whose troops, under Sir Robert Sale, withstood a determined siege which lasted from November 1841 to April 1842. Pop. (1948) 14,756.

JALAP, the tuberous root of *Exogonium* (*Ipomoea*) *purga*, or the plant bearing those roots, or the powdered drug derived therefrom. *Exogonium purga*, in the morning-glory family, Convolvulaceae, is suggestive of the cultivated morning-glory. It has twining stems—in cultivation grown on poles—alternate, entire, pointed, cordate leaves, and trumpet-shaped, rose-purple flowers, 2 to 3 inches long, with slightly exserted anthers. Some of the roots on the underground stems become enlarged and tuberous, like the related sweet potato. Native of Mexico, the plants grow in mountainous regions at altitudes of five to eight thousand feet, in rich, moist soil, near the city of Jalapa—hence the name jalap. Propagation is often by young roots. The older ones, which yield the drug, are thick, brownish, furrowed, bearing cork and lenticels. They are commonly dried in nets over fires, thus acquiring a smoky odor. They are also sometimes sundried, the resulting root-slices being lighter in color. Jalap has also been grown in cultivation in Jamaica, South America, India, Ceylon, and to some extent in Europe. The roots can be harvested in about three years. It was formerly used more generally than at present, although over 50,000 pounds are annually imported into the United States. The purgative principle is apparently in the resinous material of the root. It is glycosidic in nature, and has been designated as convolvulin and/or jalapin. It is sometimes considered a mixture, although there is disagreement concerning its components. Insects feeding on jalap seem to avoid the resinous material, and as a result the "worm-eaten" remains are more potent than the original. A number of other plants in the morning-glory family and their roots are also called jalap; some have properties similar to those of jalap in varying degrees. Among them are: Tampico jalap, *Ipomoea simulans* (Mexico); male or Orizaba jalap, also called Mexican scammony—not true scammony—*Ipomoea orizabensis* (Mexico); wild jalap, *Ipomoea pandurata* (United States and Canada); Indian jalap or turpeth root, *Ipomoea turpethum* (India, Malaya and Australia); and Brazilian jalap, *Piptostegia pisonis*.

EDWIN B. MATZKE.

JALAPA, hā-lā'pā (older **XALAPA**; in full **JALAPA ENRÍQUEZ**), city, Mexico; capital of the

State of Veracruz. It is situated at an altitude of some 4,500 feet on the southern slope of Macuil-tépetl, one of the mountains of the Sierra Madre Oriental. The city attracts numerous persons because the climate is both warmer in winter than the cities of the lofty central plateau and cooler in summer than the port of Veracruz on the coast. The streets, generally cobbled, are narrow and winding because the city has been built upon broken ground. It is constructed in the Spanish style and has many fine plazas filled with brilliantly colored flowers. Jalapa was a sizable Indian town, and its situation on the main route between Mexico City and Veracruz gave it a continued importance after the Spanish conquest. It is the center of an agricultural region which is particularly known for its coffee, tobacco, and fruit wines. There is a large cigar industry in the city, and there are cotton mills and tanneries. Pop. 66,509.

JALISCO, hä-lës'kô, state, Mexico, on the central Pacific coast. The Sierra Madre Occidental, known locally as the Sierra de Jalisco, separates the state in two parts: a narrow tropical zone which follows the coast and a more moderate and far greater plateau area to the east. The southeastern region is volcanic, the Volcano of Colima, 12,792 feet high, is along the border between Jalisco and the State of Colima. Cereals are the chief agricultural products of the uplands; cotton, sugarcane, rice, and tobacco are grown near the coast. Silver, gold, cinnabar, and bismuth are the chief mineral products. The most famous products of the state are its pottery and its tequila. The latter, an alcoholic beverage made from the juice of the maguey cactus, is produced largely in the town of Tequila, 40 miles northwest of Guadalajara, the state capital. The beautiful Lake of Chapala, the largest lake in Mexico, from which a delicious white fish is obtained, is located in the east along the State of Michoacán border. Guadalajara is a focal point for railroads and highways which run inland from Mexico's Pacific coast and thence toward Mexico City. The state has an area of 31,149 square miles. Pop. (1960) 2,443,261.

JALOUSIES. See WINDOW.

JALOUX, zhà-lōō, Edmond, French novelist, essayist, and critic: b. Marseille, France, June 19, 1878; d. Lausanne, Switzerland, August 22, 1949. His abundant and well-received work earned for him membership in the French Academy in 1936. *Soleils disparus* (1927), *La grenade mordue* (1933), and *Le dernier jour de la création* (1935) are among his best-known works of fiction. Jaloux loved to portray, in a Parisian setting or in the décor of his native Provence, the evolution of delicate sentiments and moderate passions in an atmosphere of peaceful and elegant melancholy. His literary ideal is better fulfilled in reverie, in symbolism, and even in the fantastic, than in the concrete presentation of life. His work appears, in retrospect, as a faithful reflection of the humanism, mild pessimism, and escapist tendencies of the Third Republic bourgeoisie, for whom he was writing. As a critic, Edmond Jaloux was served both by his creative experience and by his wide culture. Among his favorite writers were the English novelists and the German romantics, whom he appreciated for their antirealistic tendencies. Typical essays are collected in *L'esprit des*

livres (1923-1940) and *Les saisons littéraires* (1942; 1950).

JALUIT, hăl'ōo-it, atoll, Marshall Islands, a part of the Ralik Chain in the western Pacific Ocean. (See MARSHALL ISLANDS.) The atoll is about 30 miles long and 12 miles in breadth. There are 84 islets. At Jabor, an inlet on the southeast side of the atoll, is a safe harbor.

JAM, jām, cooked fruit suspended in a jelly (see JELLY). Except for berries, which are used whole, the fruits are cut into pieces and boiled with sugar until the juice is jellylike. *Marmalade* is chopped oranges or other fruits suspended in their syrup, essentially a jam. *Conserve* is a very thick jam, usually with nuts added. *Fruit butter* or *fruit honey* is much the same as a jelly, but it is cooked to a paste and strained through a colander. *Preserves* have a thicker concentration of fruit than jam, in a thinner syrup. All of these products are used as a spread for breads and as a filling for pastries. Some jams and jellies, notably currant, are used as an accompaniment for roasted meats and even as a glaze for meats such as ham and venison.

Commercial jams and jellies are made with added pectin, a colorless and apparently amorphous colloid of plant origin. Its microscopic threads, swollen by the hot syrup, cause the jam to set. Fully ripe fruit becomes low in natural pectin and needs the addition of the commercial product to jell. Underripe fruit frequently needs very little added pectin. The manufacturer's instructions may be followed for home-produced jam. The addition of pectin increases the quantity of jam because juices do not have to be reduced drastically, and a clearer, more natural color results from shorter cooking time. Some fruits are naturally high in pectin. The apple family, which includes quince, jells easily; so do grapes, blackberries, and currants. Strawberries and raspberries require added pectin because they are usually made into jam after they have ripened and achieved their full color.

Jam is more successful if made in small quantities from fruit which is cut up into bite-size pieces, or smaller as in the case of marmalades. A little water added to the kettle with the sugar and fruit prevents sticking. The mixture should cook only until the fruit is tender, not until all color drains out, especially in the case of berries. It should be stirred only enough to dissolve the sugar or to avoid sticking and scorching. When the fruit reaches boiling point, it should boil rapidly in order to preserve color and flavor.

In general, four cups of prepared fruit and three cups of sugar will yield about two pints of jam. If the jam is prepared without pectin, cooking time may be determined by the jelly test—inserting a cool spoon to see whether the juice will clot. A thermometer will register 220° F at the jelly stage. Boiling time is from 8 to 20 minutes, depending on the fruit, its tenderness, and its pectin content if commercial pectin is not used. Jars should be hot and sterilized when the mixture is poured. It is best to seal the jars while they are hot in order to avoid mold and then to store them in a dry place.

JAMAICA, jā-mā'kā, island in the Antilles and an independent nation since Aug. 6, 1962. This former British colony is situated in the Caribbean Sea between north latitudes 17°43' and 18°32', between west longitudes 76°11' and 78°21', about 90 miles south of Cuba. Its central position in the Caribbean and the Greater Antilles places it in the direct sea lane between the Panama Canal and the ports of Europe and the eastern United States. The island's greatest length is 146 miles from west to east; the width varies from 22 to 51 miles. Its area is 4,411 square miles. The Cayman Islands and Turks and Caicos Islands, former Jamaican dependencies, became separate units of The West Indies federation in 1959, and were placed under control of the British Colonial Office after May 31, 1962, when the federation was dissolved.

The population of Jamaica is 1,648,000 (1963), with Negroes predominating. English is spoken throughout the island. Kingston, the capital, largest city, and chief seaport, is situated in the southeast; with Port Royal and St. Andrew, it has a population of 377,412 (1959). Other important localities are Spanish Town, the capital until 1870, and the north coast ports of Montego Bay, Port Antonio, and Ocho Rios, centers of resort areas with fine beaches and excellent hotels. Mandeville is one of many mountain resorts on the island, and there are thermal springs with accommodations for visitors at Bath and Milk River.

The Land.—Jamaica is mountainous, rising to 7,402 feet at Blue Mountain Peak, in the eastern portion of the mountain chain that runs the length of the island. The Cockpit Country, in the west, is an unusual series of irregular, jagged ridges, with little earth. They are formed into circular arenas like inverted cones, varying from 30 to 200 feet in diameter and terminating in most instances with sinkholes at the bottom. The coastal plains, mainly in the south, are composed of alluvial sands, gravels, and loams, abutting the limestone hills. Jamaica's many rivers and springs gave the island its name, "Xaymaca," meaning "isle of springs" in the language of the aboriginal

Arawak Indians. The island's caves are remarkable for their beauty and grandeur.

One of the most attractive features of Jamaica is its climate. Temperatures vary between 80° and 86° F on the coast, from 68° to 75° F at 3,000 feet, and as low as 40° to 50° F at the highest mountain resorts. The heaviest rainfall, exceeding 200 inches annually, occurs near the Blue Mountains in the northeast, but the annual average for the island is about 77 inches. The rainy months are May and October, although in the northeast rains also fall between November and January. Hurricanes occur on the average of once in seven years. Hurricanes and earthquakes have inflicted disasters on the island several times during its history. The destruction of Port Royal by an earthquake in 1692 led to the founding of Kingston, which also was damaged severely by an earthquake in 1907, with a loss of 800 lives.

Flora and Fauna.—Centipedes, scorpions, harmless snakes, and many species of lizards, including the large iguana, are found in Jamaica. Insects include mosquitoes, ants, fireflies, and beetles. There are over 20 kinds of songbirds, as well as parrots, pigeons, and waterfowl. Many varieties of North American birds winter on the island. The rivers contain a few species of edible fish, but the coastal waters have so far proved relatively poor in seafoods. Common trees include the pimento (allspice) in abundance, ceiba, mango, wild orange, plantain, fustic, logwood, cedar, coconut, and other palms; but the royal palm, common to the Antilles, is absent. The southern coast exhibits flora of the arid-climate type, including cacti and thorny acacias. Begonias, orchids, ferns, and grasses abound elsewhere on the island.

Map of the island of Jamaica in the Caribbean Sea.

Economy.—In recent years, the economy of Jamaica, formerly dependent on the export of sugar and bananas, has shown a striking trend toward expansion and diversification. The government has successfully encouraged the growth of manufacturing and food production for the local market, and two relatively new industries—mining and tourism—are now major contributors to the economy. The increasing importance of the tourist trade has fostered the development of a construction industry, which is particularly active around Kingston and in the Ocho Rios region on the north coast. Trebling of the gross national product since 1950 is significant evidence of Jamaica's eco-

In recent years, since visitors have discovered Jamaica's ideal climate, tourism has become a major industry.

Herbert Lanks-Pix

nomic progress, much of which may be traced to the development of light industry.

Jamaica contains the world's largest known resources of commercial bauxite (over 500 million tons), as well as barites, ceramic clays, cobalt, copper, gypsum, lead, limestone, marble, oil, cave phosphates, silica, and zinc.

Agriculture.—More than a third of the total land area, amounting to over 1,000,000 acres, is in agricultural use, including meadow and pasture. An additional 500,000 acres are in woods and forests. Sugar is the main export crop, 60 percent of the cane being produced on estates and the remainder on farms. The total acreage actually in cane was 174,990 in 1959. Over 100,000 acres are devoted to bananas, and 47,000 acres are under citrus cultivation. Other products include pimiento, coffee, annatto, cacao, coconuts, rice, tobacco, fruits, vegetables, and livestock. The major agricultural exports are handled by marketing organizations.

Industry.—The government encourages industry both by the Industrial Development Corporation, a statutory body set up in 1952 with offices in New York and London, and by incentive legislation passed in 1956: the Pioneer Industries (Encouragement) Law, the Industrial Incentives Law, and the Export Industry (Encouragement) Law. The Corporation is developing an industrial estate in Kingston, and the incentive program has been responsible for the introduction of many new industries. In addition to cement manufacture (stimulated by the growth of tourism), the production of rum and molasses, the reduction of bauxite to alumina, and the processing of agricultural products, there are many light industries. In 1958 manufacturing replaced agriculture as the principal contributor to the gross domestic product.

Jamaica is the world's largest exporter of bauxite, which is mined by one Canadian company and three American firms. Exports rose from 2,529,363 dry tons in 1955 to 4,147,555 dry tons in 1960. The Canadian company reduces bauxite to alumina on the island, and alumina exports rose from 183,969 tons in 1955 to 665,361 tons in 1960, a 67 percent increase over 1959. Gypsum is also mined, and prospecting for iron ore and copper is taking place.

The tourist industry plays an increasingly important part in the Jamaican economy. In 1960, 226,000 tourists visited the island, compared with 61,831 in 1948. The value of the industry was estimated at £11.8 million.

Transportation.—Jamaica has 2,668 miles of main roads, and 2,137 miles of secondary roads

suitable to light motor traffic. There are 249 miles of railroad. Two international airports serve the island, one at Palisadoes, near Kingston, the other at Montego Bay. Eleven scheduled airlines and many shipping lines call at the island.

Education.—The Jamaican government has endeavored to make primary education available to all children, and secondary education to those pupils who demonstrate ability. In the fiscal year 1960 it spent £5.3 million on education, compared with £0.8 million in fiscal year 1948. There were 741 primary schools in 1963, with an enrollment of 305,000, and 45 secondary schools, with 18,270 pupils. There were also five teacher-training colleges, six vocational schools, and a college of arts, science, and technology. The latter institution is the University of the West Indies, which was established in 1949 at Mona, St. Andrew, and became an autonomous body in 1962. It annually enrolls about 700 students. Each year more than 3,000 other Jamaicans attend universities, colleges, and training hospitals in Great Britain, the United States, and Canada.

Government.—Jamaica is a constitutional monarchy and an independent dominion within the Commonwealth of Nations. The island formed an internally self-governing territory within the federation of The West Indies from July 4, 1959, to May 31, 1962, when the federation was officially dissolved. The new constitution which went into effect commensurate with independence on Aug. 6, 1962, provides for a governor general who is appointed by the British sovereign; a privy council of six members appointed by the governor general; a cabinet consisting of a prime minister and at least 11 other ministers; and a bicameral legislature. There is a House of Representatives comprising 45 members who are elected one to each constituency by universal adult suffrage for five-year terms. The Senate has 21 members, of whom 13 are appointed by the governor general on the advice of the prime minister, and the remaining eight on the advice of the leader of the opposition.

The prime minister must be able to command a majority in the House of Representatives, and members of the cabinet are appointed on his advice. Not more than three or less than two cabinet ministers must be members of the Senate, and the remainder are chosen from the House of Representatives.

The governor general acts on the advice of the prime minister and cabinet except when the matter is the responsibility of some other body. He is advised by the privy council on the exercise of his

disciplinary power over the civil service and on his use of the royal prerogative of mercy.

History.—Jamaica was discovered on May 3, 1494, by Christopher Columbus, and it remained a Spanish colony from the appointment of the first governor in 1509 until its capture by the English, under Adm. William Penn, in 1655. The Spaniards exterminated the original Arawak Indian inhabitants and introduced Negro slaves. When the English conquered Jamaica, many of these slaves escaped into the interior, forming the nucleus of a mountain people called Maroons, who developed a distinctive culture and fought for their independence for over a century. A Jamaican constitution came into effect in 1662, establishing a governor, a nominated council, and an elected House of Assembly. British sovereignty was recognized by the Treaty of Madrid in 1670, and government under the 1662 constitution continued until the 19th century.

After the English conquest, Jamaica grew rich and prosperous from raids conducted on Spanish shipping by the buccaneers, who made the island their headquarters. Large-scale importation of slaves began, and Jamaica became a thriving marketplace for this trade. The island reached the height of its prosperity around 1800, exporting large quantities of sugar and coffee.

Severe economic difficulties during the first half of the 19th century ruined the planters and created social unrest among the impoverished Negroes. Abolition of the slave trade in 1807 and emancipation from 1833 to 1838 increased the planters' production costs, and the withdrawal of British tariff protection for colonial products in 1846 completed their economic downfall. Taxation, inequities in land distribution, lack of political representation, and the importation of East Indian labor aggravated the resentment of the Negroes toward the whites. This hostility culminated in an unsuccessful rebellion at Morant Bay in 1865.

The establishment of British colonial government the next year ushered in a period of political, economic, and social reform. The new governor, Sir John Peter Grant, reorganized the judicial and financial structures, improved education and medical services, and introduced the cultivation of bananas, which became one of Jamaica's staple crops. From 1866 to 1944 the governor was advised by a privy council and a legislative council, both at first composed of official and nominated members. An elected element was introduced into the council in 1884 and gradually extended over the next 60 years.

The Constitution of 1944 gave Jamaica a wide measure of internal self-government, including

universal suffrage. In 1953 ministerial government and an elected majority in the executive council were introduced, and in 1957 the beginnings of cabinet government were established when a council of ministers replaced the executive council. The 1959 constitution established full internal self-government within the federation of The West Indies, which Jamaica had joined at its inception on Jan. 3, 1958. In 1961 the United States returned to the Jamaican government the bases on the island it had leased from Great Britain during World War II, and retained navigational facilities on the island for 17 years.

Although Jamaica comprised more than half of The West Indies federation's total land area and population, it was represented by a minority in the federal legislature, and many Jamaicans believed they would be dominated in an independent federation by the smaller and less prosperous members. In a referendum of Sept. 19, 1961, they elected by a vote of 251,935 to 216,400 to withdraw from the federation. Representatives of Jamaica and Great Britain subsequently agreed to provisions for the island's independence outside the federation. In general elections held on April 10, 1962, the electorate turned out the ruling People's National Party of Prime Minister Norman W. Manley in favor of the Jamaican Labour Party headed by Sir Alexander Bustamante. Jamaica was the first of the British West Indies dependencies to attain full sovereignty when the island became independent on Aug. 6, 1962.

Information Services, New York.

JAMAICA, former village, New York, and a part of the Borough of Queens in New York City since Jan. 1, 1898. Formerly it was the seat of Queens County, Long Island. It is now an industrial and residential center in the southeastern area of the city, a subway terminus, and a junction on the Long Island Rail Road. In 1657 Governor Peter Stuyvesant gave permission for its settlement and in 1660 granted a charter. The original name of Rustdorp was soon changed to Jamaica, a word derived from the local Jameco Indian tribe. Important among the

several well-preserved pre-Revolutionary houses is King's Mansion which once belonged to Rufus King, a signer of the Constitution and an early minister to England.

JAMAICA BAY, bay, New York, is an inlet of the Atlantic Ocean which indents the southwest corner of Long Island in the boroughs of Brooklyn and Queens in New York City. Elliptical in shape and slightly less than 20 square miles in area, it contains many marshy islands. It is separated from the ocean for nearly its whole extent by the peninsula of Rockaway Beach. Coney Island is near the entrance channel. Floyd Bennett Field is located on the southwest shore while the New York International Airport is situated on the northwest shore.

JAMAICA PLUM. See SPONDIAS.

JAMDINA or **JAMDENA**, yām-dā'nā, island, Indonesia, largest of the Tanimbar group, in the Moluccas 300 miles southeast of Ambon (Amboina). It is 70 miles long and 28 miles wide, the area being 1,100 square miles. Saumlakki, the chief village, is at the southern end of the island.

JAMES, Saint (often known as **SAINT JAMES THE GREATER**), the son of Zebedee. He was called to be an apostle together with his brother St. John, as they were mending their nets with their father Zebedee, who was a fisherman. They then followed Christ, were witnesses with St. Peter of the transfiguration, and accompanied Christ in the garden of Gethsemane. In the lists of the apostles given in the synoptic Gospels and in the Acts the names of Peter, Andrew, James and John stand first; and it is plain that these four were at the head of the 12 throughout. After the ascension St. James persevered in prayer with the other apostles and the women and the Lord's brethren. Nothing further is certainly known of him until the Passover of 44, when, being in Jerusalem, the Jews stirred up Herod Agrippa I against him, and he was put to a cruel death. Thus St. James was the first of the apostles who suffered martyrdom. There is a legend that he went to Spain, and that his bones, said to be in the foundation of the Cathedral of Santiago-de-Compostella in Coruña, lent miraculous aid to the Spaniards against the Saracens.

JAMES, Saint (called **THE LESS**), an apostle, was the son of Alphaeus. Little is known of him, though legend has it that he was active in Palestine and Egypt and finally was crucified in Lower Egypt.

JAMES (called **THE JUST**), a brother or cousin of Jesus, became head of the Christian religious community of Jerusalem. At first skeptical of Jesus, he later became a convert after being favored by an appearance of the risen Christ. Free from strictly legalistic views, he nevertheless felt that Gentile Christians ought to respect observances of laws by Jewish Christians. The Epistle of James is generally ascribed to him.

JAMES I, king of England and, as James

VI, also of Scotland: b. Edinburgh, June 19, 1566; d. Theobalds, Hertfordshire, March 27, 1625. He was the son of Mary, Queen of Scots, and Henry, Lord Darnley, and great-great-grandson of Henry VII of England. With the forced abdication of his mother in 1567 he was proclaimed king of Scotland, and during his minority the country was governed by a succession of regents—the earls of Moray, Lennox, Mar, and Morton. During most of this period he was under the tuition of the notable George Buchanan. From the first he seems to have imbibed those exalted notions of the royal authority and divine right which proved so injurious to his posterity. But James soon found it advisable to ally himself with Queen Elizabeth and to accept a pension from her. When, however, it became apparent that the life of his mother was in danger from the sentence of an English judicature, James sent representatives to England to intercede with Elizabeth; but his whole procedure in the matter shows a singular callousness. As a matter of form he ordered the clergy to pray for his mother, but when the news of Mary's execution in 1587 arrived James was not much moved, though he attempted to make a show of indignation by condemning one of the commissioners to death, a sentence which, however, he commuted to banishment. On Nov. 23, 1589 James married Anne, daughter of Frederick II, king of Denmark. On his return home, after passing the winter in festivities at Copenhagen, he was in some danger from the unruliness of the nobles; and for several succeeding years of his reign the history of Scotland displays much turbulence and party contest, but the supremacy of the crown was finally vindicated. In 1603 James succeeded to the crown of England, on the death of Elizabeth, and proceeded amidst the acclamations of his new subjects to London. One of his first acts was to bestow a profusion of honors and titles on the inhabitants of both countries. At a conference held at Hampton Court between the divines of the Established Church and the Puritans, James exhibited the ill will he bore to popular schemes of church government. The meeting of Parliament also enabled him to assert those principles of absolute power in the crown which he could never practically maintain, but the theoretical claim of which provided the increasing spirit of freedom in the House of Commons with constant matter of alarm and contention. Although James had behaved with great lenity to the Catholics in Scotland, those in England were so disappointed in their expectations of favor that the famous gunpowder plot was concerted in 1605, the object of which was to blow up the king and Parliament. (See **GUNPOWDER PLOT**; **GREAT BRITAIN AND NORTHERN IRELAND** —21. *History* (Early Stuarts and Commonwealth)).

In 1612 he lost his eldest son Henry, a prince of great promise, then 19; and in the following year the eventful marriage of his daughter Elizabeth with the Elector Palatine took place. No circumstance in the reign of James was more unpopular than his treatment of the celebrated Sir Walter Raleigh (q.v.). James had set his heart on marrying his son Charles to a Spanish princess, but the negotiations failed through the overbearing temper of Buckingham (George Villiers), the royal favorite, who quarreled with the grandees of the Spanish court. The close of the life of James was marked by

violent contests with Parliament and by a breach with Spain after the negotiations for Prince Charles' marriage had failed. His reign saw the beginnings of English colonization in America with the founding of Jamestown in 1607, and the completion of a new translation of the Bible (1611), called in his honor the King James version. His numerous literary works include 15 sonnets published in Edinburgh in 1584 under the title *Essays of a Prentice in the Divine Art of Poesy*; a translation of the Psalms of David; *Basilikon Doron* (1599); and a treatise, *Daemonologie* (1599). His famous *Counterblaste to Tobacco* was first published anonymously in 1604. An edition of his prose works, including Biblical commentaries, was published in London in 1616 by James Montagu, bishop of Winchester. The political works were reprinted in 1928.

Consult Henderson, T. F., *James I and VI* (London 1904); Davies, Godfrey, *The Early Stuarts* (New York 1937); Sisson, C. J., *James I as Poet and Political Writer* (Oxford 1938).

JAMES II, king of England: b. London, England, Oct. 14, 1633; d. St. Germain, France, Sept. 6, 1701. The third son of Charles I and Henrietta Maria, daughter of Henry IV of France, the first born having lived but two hours. Created duke of York and Albany (1643), James fled England during the Civil War and spent 12 years abroad, serving with distinction in the French and Spanish armies. Returning to England with his elder brother, Charles II, at the Restoration (1660), he was appointed lord high admiral and also made warden of the Cinque Ports. The diary of Samuel Pepys, secretary of the navy, attests the great interest which James showed in improving the organization of the fleet, including the creation of a permanent body of naval officers. In 1664 an English squadron surprised and seized the Dutch province of New Netherlands, in America, for which the duke had been granted a secret royal patent. New Amsterdam and Fort Orange were renamed New York and Albany in his honor. He commanded the fleet in a naval victory over the Dutch in 1665 and in a drawn battle against them at Southwold Bay in 1672, but the Test Act, barring Catholics from public office, cost him his naval post in 1673.

In September 1660 he had married Anne Hyde, daughter of Edward, afterwards 1st earl of Clarendon. Before her death in 1671 she became a Roman Catholic, an event which led to the public avowal by James in 1672 of his own conversion to that faith. On September 30 of the next year he married a Catholic princess, Mary Beatrix of Este, daughter of the duke of Modena, thus definitely aligning himself with the policies of Louis XIV; but at the insistence of Charles II he assented to the marriage in 1677 of his eldest daughter Mary to the Protestant prince, William of Orange.

After a few months' retirement (1679) on the Continent during the national ferment over the Popish Plot, James served as high commissioner in Scotland (1679–1682), and in 1684 regained his former post at the Admiralty. The efforts of Parliament to prevent his succession failed; and at the death of Charles II in 1685, James came to the throne. He showed from the first his determination to restore the power of the Roman Catholic Church and to make himself an absolute monarch. Rebellions led by the duke of Argyll in Scotland and by the duke of Monmouth in England (1685) were suppressed; but the savage

reprisals known as the Bloody Assizes, conducted by the lord chief justice George Jeffreys, alienated much of James' following even among the Tories. His overthrow was hastened by the resistance of seven of the English bishops to his demand that they read from their pulpits a declaration of indulgence, exempting Catholics and dissenters alike from penal statutes. Indicted for petitioning against the order, the bishops were acquitted amid popular rejoicing on June 30, 1688, and on that day a large body of Whig nobility and gentry concurred in inviting William of Orange to occupy the English throne. With a fleet bringing a force of 14,000 men, William arrived at Torbay, Devon, on November 5; several of James' leaders at once deserted and the royal army followed by whole regiments. James was apprehended in flight and brought back to London, but later was allowed to escape and reached France, where he was hospitably received by Louis XIV and given the château of St. Germain as a refuge. Meanwhile, William and Mary were proclaimed joint sovereigns of England (Feb. 13, 1689), and Anne, sister of Mary, was declared next in succession, to the exclusion of her infant brother James Stuart, known as the Old Pretender. In France James did not desist from efforts to regain the throne. He landed in Ireland on March 12, 1689, but was completely defeated by the king's armies at the Battle of the Boyne, July 1, 1690, and returned to France, where he spent his remaining years.

Consult Belloc, Hilaire, *James the Second* (Philadelphia 1928); Turner, F. C., *James II* (New York 1948).

JAMES or JAMES EDWARD, prince of Wales, known also as **JAMES III** and the **OLD PRETENDER**. See **STUART, JAMES FRANCIS EDWARD**.

JAMES I, king of Scotland: b. Dunfermline, Scotland, July 1394; d. Perth, Feb. 21, 1437. He was the third son of Robert III, second of the Stuart kings. To remove him from danger following the murder of his elder brother David, duke of Rothesay, King Robert ordered him to France in 1406. He was captured by English sailors on the journey, however, and detained by Henry IV and Henry V for the next 18 years in England, where he was given a good education and treated by Henry V as a guest. Just before his release he married Jane (or Joan) Beaufort, daughter of the earl of Somerset, and in her praise wrote *The Kingis Quair*, an allegorical poem in the style of Chaucer, discovered in the Bodleian Library at Oxford in 1783. Several other poems, including *The Ballad of Guid Counsall*, *Christis Kirk on the Greene*, and *Pebblis to the Play*, have been attributed to him, with doubtful authenticity.

James was crowned king of Scotland at Scone on May 21, 1424. During his 13 years of rule he did much to curtail the arbitrary power of the feudal lords and to establish government by law in the kingdom, with the aid of Parliament. The resulting enmity of the nobles led to his assassination by Sir Robert Graham at the instigation of Walter Stewart, earl of Atholl, James' uncle. The legend of the heroic effort by Catherine Douglas (nicknamed "Bar-lass"), one of the queen's attendants, to bar the door to the assassins with her arm, arose out of this incident.

Consult Balfour-Melville, Evan W. M., *James I, King of Scots* (London 1936).

JAMES II, king of Scotland: b. Oct. 16, 1430; d. Roxburgh, Scotland, Aug. 3, 1460. Son of James I, he was crowned at Holyrood in his seventh year, while Archibald, 5th earl of Douglas, was named regent. In 1449 James married Mary of Gelderland, and assumed power in his own name, bringing to an end the struggle which had persisted during his minority between the house of Douglas and the factions of Sir Alexander Livingstone and Sir William Crichton. When the Douglasses continued to assert their independent power, James murdered William, the 8th earl, with his own hand at Stirling Castle in 1452. Having further secured his reign by suppressing an insurrection by the next earl, whose lands he confiscated, James attacked English forces in the south of Scotland, and was killed by a wedge from a cannon while besieging Roxburgh Castle.

JAMES III, king of Scotland: b. July 10, 1451; d. near Bannockburn, Scotland, June 11, 1488. The eldest son of James II, he was crowned at Kelso in 1460. During his minority Scotland remained under the authority of the Boyds of Kilmarnock, one of whom married the king's sister Mary in 1467. Two years later James himself was married to Princess Margaret of Denmark and assumed the government. He was opposed in his policy of reducing the power of the nobles by his brothers Alexander, duke of Albany, and John, earl of Mar. Mar was murdered in 1479, but Albany escaped and, seeking support in England, was recognized by Edward IV in 1482 as king of Scotland. With Richard, duke of Gloucester (later Richard III), he invaded Scotland, taking Berwick and marching on Edinburgh, where he and James were temporarily reconciled. Two years later, after again conspiring against the king, Albany fled to France. The rebellious nobles then made the king's son James head of their party, and finally routed the royal army at Sauchieburn, near Bannockburn, on June 11, 1488. The king was murdered nearby later the same day.

JAMES IV, king of Scotland: b. March 17, 1473; d. Flodden, England, Sept. 9, 1513. He was crowned at Scone in 1488 soon after the assassination of his father James III, for his share in which James IV is said to have worn an iron belt as penance. Under his rule Scotland advanced materially and rose in political importance. In 1503 he was married to Margaret, daughter of Henry VII, from whom the Stuarts derived their title to the English throne a century later. With Henry VIII, his brother-in-law, however, he was unable to remain at peace. After making a treaty of alliance with Louis XII of France in 1512, James gathered a large army, invaded England, and was defeated and killed at Flodden, along with a large number of Scottish nobles.

JAMES V, king of Scotland: b. Linlithgow, Scotland, April 10, 1512; d. Falkland, Dec. 14, 1542. He succeeded to the throne as an infant after his father, James IV, was killed at the Battle of Flodden (1513), and began to govern in his own right in 1528. He married Princess Madeleine of France at Paris in 1537, and on her death espoused Mary, daughter of the duke of Guise, in 1538. When his uncle, Henry VIII of England, invaded Scotland in 1542, James was

deserted by the Protestant nobles and suffered defeat at the Battle of Solway Moss. He died the next month, several days after the birth of his daughter Mary, Queen of Scots. Noted for his efforts to protect the poor from oppression, he was often called the "king of the commons."

JAMES VI, king of Scotland. See **JAMES I**, king of England.

JAMES, Edmund Janes, American educator and author: b. Jacksonville, Ill., May 21, 1855; d. Covina, Calif., June 17, 1925. He was educated at Northwestern and Harvard universities, and at the University of Halle in Germany. After serving as principal of an Illinois high school for several years, he was appointed (1883) professor of public finance and administration at the Wharton School of Finance and Commerce at the University of Pennsylvania. He was a founder in 1885 of the American Economic Association, and a leader also in the formation of the American Academy of Political and Social Science, becoming the academy's first president (1890-1901) and the first editor of its *Annals* (1890-1896). After serving at the University of Chicago as professor of public administration (1896-1901), he was president of Northwestern University (1902-1904), and of the University of Illinois from the latter date until 1920. In this position he secured greatly increased legislative appropriations for the university and raised its standards of scholarship. He was the author of *The Canal and the Railway* (1890); *The Education of Business Men in Europe* (1899); *The Growth of Great Cities in Area and Population* (1900); *A National Economic Program* (1916).

JAMES, Frank Cyril, British economist and educator: b. London, England, Oct. 8, 1903. He graduated from the University of London in 1923 and three years later received a Ph.D. from the University of Pennsylvania. He began teaching at the Wharton School of Finance and Commerce there in 1924, and in 1935 was made chairman of the Graduate Faculty in Social Sciences. Three years later he was invited to join the faculty of McGill University in Montreal, Canada, and became its principal and vice chancellor in 1940. He is the author of *The Economics of Money, Credit and Banking* (1930; 3d ed., 1940) and *The Growth of the Chicago Banks* (2 vols., 1938).

JAMES, George Payne Rainsford, English novelist and historian: b. London, England, Aug. 9, 1799; d. Venice, Italy, June 9, 1860. Inspired by the novels of Sir Walter Scott, he began at an early age to write biographies and historical romances, becoming widely known with the appearance of *Richelieu* (1829), which Scott commended. During the next 30 years he published more than 100 popular novels, whose style William Makepeace Thackeray parodied in his *Novels by Eminent Hands*. His historical works include *Memoirs of Great Commanders* (1832); *Life of Edward, the Black Prince* (1836); *Life of Richard Coeur-de-Lion* (1842-1849); and *A History of Chivalry* (1843). Under William IV he held the office of historiographer royal (1839), in this capacity writing a *History of the United States Boundary Question* and *The Corn Laws*. In 1850 he was appointed British consul at Boston, Mass., and served in the same capacity at

Richmond, Va., from 1852 to 1856, when he was made consul at Venice.

JAMES, George Wharton, American explorer: b. Gainsborough, Lincolnshire, England, Sept. 27, 1858; d. St. Helena, Calif., Nov. 8, 1923. Having come to the United States in 1881, he was pastor of Methodist churches in California and Nevada, and afterwards devoted himself to travel in the Southwest and the study of Indian cultures. He lectured extensively and wrote more than 40 books describing these regions and their Indian life, including *In and Around the Grand Canyon* (1900); *In and Out of the Old Missions of California* (1905); *Prehistoric Cliff Dwellings of the Southwest* (1913); *Indian Blankets and Their Makers* (1914).

JAMES, Henry, American ethical and religious philosopher: b. Albany, N. Y., June 3, 1811; d. Cambridge, Mass., Dec. 18, 1882. He was the father of Henry James (1843-1916) and William James (1842-1910) (qq.v.). Having graduated from Union College, Schenectady, N. Y., in 1830, he entered Princeton Theological Seminary in 1835 to prepare for the Presbyterian ministry, but soon found himself unable to accept the tenets of any organized church. In 1844, while in England, he found in the writings of Emanuel Swedenborg the approach he had been seeking, and devoted himself from this time on to expounding his own adaptations of Swedenborgian thought. In social philosophy he was an adherent of Fourierism and the Brook Farm school, whose leaders he came to know intimately. Among his books are *Moralism and Christianity* (1850); *The Nature of Evil* (1855); *Christianity the Logic of Creation* (1857); *Substance and Shadow* (1863); *The Secret of Swedenborg* (1869); and *Society the Redeemed Form of Man* (1879). His *Literary Remains*, edited by William James, were published in Boston in 1885.

Consult Grattan, Clinton H., *The Three Jameses: A Family of Minds* (New York 1932); Warren, Austin, *The Elder Henry James* (New York 1934); Matthiessen, Francis O., *The James Family* (New York 1947).

JAMES, Henry, American novelist and critic: b. New York, N. Y., April 15, 1843; d. London, England, Feb. 28, 1916. He was the son of Henry James (1811-1882, q.v.) and brother of the philosopher William James (1842-1910, q.v.). Under his father's guidance, he received much of his early education in Geneva, London, Paris, and Boulogne, where his family resided in 1855-1858 and 1859-1860. Returning to the United States, he entered Harvard Law School in 1862 and while still at Cambridge was encouraged by William Dean Howells, editor of the *Atlantic Monthly*, to follow a literary career. From about 1865 he devoted himself to writing, contributing to the *Nation* and the *Galaxy* as well as to the *Atlantic*. In the latter his first novel, *Watch and Ward*, was serialized (1871). Meanwhile, in 1869 he had visited Europe again, and after 1872 maintained virtually permanent residence there, settling in England in 1876 and becoming a British subject in 1915. A month before his death in 1916 he received the Order of Merit.

Working at first in London, and from 1896 in Rye, Sussex, James produced novels, stories, and literary criticism which have won ever-increasing critical acclaim. While his fiction deals almost exclusively with the wealthy and well-

born in English and expatriate American society, and has been further criticized for the labyrinthine complexity of its style, his superb craftsmanship sustains his reputation as a novelist's novelist. *Roderick Hudson* (1876) was followed by some 20 major works, notably *The American* (1877), of which a dramatized version was produced in London in 1891; *The Europeans* (1878); *Daisy Miller* (1879), his first considerable success; *The Portrait of a Lady* (1881); *Washington Square* (1881), dramatized in 1948 as *The Heiress* and made into a motion picture; *Princess Casamassima* (1886); *The Bostonians* (1886); *The Tragic Muse* (1890); *The Spoils of Poynton* (1897); *What Maisie Knew* (1897); *The Awkward Age* (1899); *The Sacred Fount* (1901); *The Wings of the Dove* (1902); *The Ambassadors* (1903); and *The Golden Bowl* (1904). Two novels unfinished at his death, *The Ivory Tower* and *The Sense of the Past*, were published in 1917.

Besides these he wrote a large number of stories, of which many take rank with his major works and have appeared, variously combined, in numerous editions, beginning with *A Passionate Pilgrim and Other Tales* (1875). Other such collections include *The Madonna of the Future and Other Tales* (1897); *Tales of Three Cities* (1884); *The Aspern Papers*, Louisa Pallant, and the Modern Warning (1888); *The Reverberator* (1888); *The Wheel of Time* (1893); *The Real Thing and Other Tales* (1893); *Embarrassments* (1896); *The Two Magics* (1898), containing *The Turn of the Screw*, a ghost story of subtle horror, dramatized by William Archibald and produced at The Playhouse, New York, Feb. 1, 1950; and *The Finer Grain* (1910). In literary criticism he is best known for his *French Poets and Novelists* (1878); *Partial Portraits* (1888); *Essays in London and Elsewhere* (1893); *Picture and Text* (1893); *The Question of Our Speech, and the Lesson of Balzac* (1905); *Notes on Novelists* (1914). Books describing his travels include *Transatlantic Sketches* (1875); *Portraits of Places* (1883); *A Little Tour in France* (1885); *English Hours* (1905); *The American Scene* (1907), resulting from a visit to the United States—his first in 20 years; and *Italian Hours* (1909). He wrote biographies of Nathaniel Hawthorne (1879) and William Wetmore Story (1903) and two volumes of autobiography, *A Small Boy and Others* (1913) and *Notes of a Son and Brother* (1914). A collected edition, *The Novels and Tales of Henry James*, was published in New York (26 vols., 1907-1917) and with additions, in London (35 vols., 1921-1923). See also *AMBASSADORS, THE; AMERICAN, THE; AMERICAN LITERATURE—The Elusive Spirit of Life: Henry James; BOSTONIANS, THE; DAISY MILLER*.

(New York 1920); Brooks, Van Wyck, *The Pilgrimage of Henry James* (New York 1925); Edgar, Pelham, *Henry James: Man and Author* (London 1927); Matthiessen, Francis O., *Henry James: the Major Phase* (New York 1944); Dupee, Frederick W., ed., *The Question of Henry James: a Collection of Critical Essays* (New York 1945); Matthiessen, F. O., and Murdock, Kenneth B., eds., *The Notebooks of Henry James* (New York 1947); Edel, Leon J., *Henry James 1843-1870: the Untried Years* (Philadelphia 1953).

JAMES, Henry, American writer, lawyer, and administrator: b. Boston, Mass., 1879; d. New York, N. Y., Dec. 13, 1947. He was the son of the philosopher William James (1842-1910,

q.v.). After graduating from Harvard University, he practiced law in Boston (1904-1912), and then was business manager until 1917 of the Rockefeller Institute for Medical Research in New York. He also served as chairman of the board of the Teachers Insurance and Annuity Association from 1934 until his death. He edited a two-volume collection, *The Letters of William James* (1920), and was author of two notable biographies, *Richard Olney* (1923) and *Charles W. Eliot* (1930), which latter received the Pulitzer Prize.

JAMES, Jesse (Woodson), American outlaw: b. near Kearney (then Centerville), Clay County, Mo., Sept. 5, 1847; d. St. Joseph, Mo., April 3, 1882. His family were originally Kentuckians and openly supported the Southern cause in the Civil War. Before he had reached 16 years of age he had gained a reputation for marksmanship and daring while serving with Confederate guerrilla forces led by William Clarke Quantrill. At the close of the war he surrendered, but on his return home was declared an outlaw through the influence of hostile neighbors. In 1866 he was joined by his brother FRANK JAMES (in full ALEXANDER FRANKLIN JAMES: b. Jan. 10, 1843; d. Feb. 18, 1915), Coleman Younger, and others, in forming an armed band which during the next 16 years was responsible for a long series of train and bank robberies and murders in Midwestern states. A reward of \$10,000 being offered by Governor Thomas T. Crittenden of Missouri for the taking of the James brothers, two of his own gang, Charles and Robert Ford, turned traitor and shot and killed him in his home at St. Joseph, Mo., where he was living under the name of Thomas Howard. Later Frank James surrendered but was never convicted, and spent his remaining years on a farm near Excelsior Springs, Mo. In his lifetime Jesse James was admired by many for the epic style of his exploits. Afterwards legends grew about him; he was the hero of more than 400 dime novels, a popular ballad, and a mural painted by Thomas Hart Benton in the state capital at Jefferson City, Mo.

Consult James, Jesse E., *Jesse James, My Father* (Independence, Mo., 1899); Love, Robertus, *The Rise and Fall of Jesse James* (New York 1926); Breihan, Carl W., *The Complete and Authentic Life of Jesse James* (New York 1953).

JAMES, John Angell, English Congregational clergyman: b. Blandford, Dorsetshire, England, June 6, 1785; d. Birmingham, Oct. 1, 1859. Before he was 20 he became pastor of Carr's Lane Chapel in Birmingham, serving there for more than 50 years and becoming one of the most noted preachers of his time. His works, with autobiography, were published in 17 volumes (1860-1864).

JAMES, Marquis, American journalist and author: b. Springfield, Mo., Aug. 29, 1891; d. Rye, N. Y., Nov. 19, 1955. He began his career as a reporter on Midwestern newspapers, served in France in World War I, and afterwards was national director of publicity for the American Legion. His history of that organization was published in 1923. He was twice awarded the Pulitzer Prize, for *The Raven, a Biography of Sam Houston* (1929), and for *Andrew Jackson: Portrait of a President* (1937), a sequel to his earlier book, *Andrew Jackson:*

The Border Captain (1933). *The Cherokee Strip* (1945) is an autobiography.

JAMES, Montague Rhodes, British bibliographer, Biblical scholar, and author: b. Goodnestone, Kent, England, Aug. 1, 1862; d. Eton, June 12, 1936. He was provost of King's College, Cambridge (1905-1918), and of Eton College until his death. His scholarly works included critical studies of Biblical texts; treatises on psalters and other medieval remains; and catalogues of library manuscripts. He was an authority on stained glass and other religious art, and as M. R. James was widely known for his fantastic stories, unique in their blending of erudition and horror, among which were *Ghost Stories of an Antiquary* (1905); *More Ghost Stories* (1911); and *A Thin Ghost and Others* (1919).

JAMES, Philip, American composer and conductor: b. Jersey City, N. J., May 17, 1890. He was educated in New York, where he studied with Rubin Goldmark and others, and during World War I was bandmaster of the General Headquarters Band of the American Expeditionary Force. In 1923 he joined the faculty of New York University, and 10 years later became chairman of the music department there. He was conductor of the New Jersey Symphony Orchestra (1922-1929) and the Bamberger Little Symphony Orchestra (1929-1936). Among his compositions are three Bret Harte overtures (1926, 1933, 1935); *General William Booth Enters into Heaven* (1932), a cantata; two suites for strings (1933, 1946); and two symphonies (1943, 1949).

JAMES, Thomas, American pioneer: b. Maryland, 1782; d. Monroe City, Ill., December 1847. In 1809 he accompanied Manuel Lisa's furtrading expedition up the Missouri River as far as Fort Mandan; and in 1821, with John McKnight, led one of the earliest trading expeditions through the Comanche country to Santa Fé, arriving just after Mexico had secured its independence from Spain. He returned in 1824 to Illinois, where he served two terms in the state legislature (1825-1828). He published *Three Years Among the Indians and Mexicans* (1846), which was reprinted by the Missouri Historical Society in 1916.

JAMES, Thomas, English navigator: b. about 1593; d. ?1635. In 1631 he was chosen by the merchants of Bristol to lead an expedition in search of the Northwest passage to the Indies and so to circle the globe. With a crew of 22 he set out in May of that year in a small ship, the *Henrietta Maria*, reached Greenland a month later, and then was forced south into Hudson Bay. He discovered and named Cape Henrietta Maria, and also was the first to sail on James Bay, which was later named after him. Unable to reach the mainland, he spent the winter on a small island in the bay, and returned to England in October 1632. His *Strange and Dangerous Voyage of Captain Thomas James* (1633) is one of the most interesting early English books of exploration.

JAMES, Thomas Lemuel, American public official: b. Utica, N. Y., March 29, 1831; d. New York, N. Y., Sept. 11, 1916. He began his career as a newspaper publisher in Utica and Hamilton,

N. Y., became a customs inspector in the port of New York in 1861, and rose to the rank of deputy collector in 1870. Three years later he was appointed postmaster of New York, serving until 1881 when President James A. Garfield appointed him postmaster general of the United States. During ten months in that office he succeeded in ending the Star Route frauds, turned the department's deficit into a surplus, and reduced letter postage from three to two cents.

JAMES, Thomas Potts, American botanist: b. Radnor, Pa., Sept. 1, 1803; d. Feb. 22, 1882. He entered the wholesale drug business in Philadelphia in 1831 and taught at the Philadelphia College of Pharmacy for many years, retiring to Cambridge, Mass., in 1866. Meanwhile he had contributed a series of valuable papers on North American mosses to various scientific publications. After 1878, with Charles Leo Lesquereux, he began the preparation of the *Manual of North American Mosses* (1884), which was completed after his death.

JAMES, Will (full name WILLIAM RODERICK JAMES), American writer and illustrator: b. near Great Falls, Mont., June 6, 1892; d. Hollywood, Calif., Sept. 3, 1942. Born in a covered wagon and soon left an orphan, he was adopted by a fur trapper and taught by him to write. From the age of 13 he was employed on Western and Canadian horse and cattle ranges, and as a performer in rodeos. He had started drawing at an early age, and in 1920 finally decided to give up cowpunching and seek a career as a writer and artist, illustrating his own books. *Cowboys, North and South* appeared in 1924, followed the next year by *The Drifting Cowboy*. *Smoky* (1926) received the John Newbery Medal for the best children's book of the year, and later was made into a motion picture. Others of his works are *Lone Cowboy* (1930), an autobiography; *Scorpion* (1936); *Cowboy in the Making* (1937); and *Flint-Spears* (1938). Stories and articles which he contributed to leading magazines were collected in *Sun-up* (1931) and *All in the Day's Riding* (1932).

JAMES, William, American psychologist and philosopher: b. New York, N. Y., Jan. 11, 1842; d. Chocorua, N. H., Aug. 26, 1910. He was the son of Henry James (1811-1882, q.v.) and brother of Henry James (1843-1916, q.v.). His education, begun in New York private schools, was continued under his father's guidance in France, England, and Switzerland. In Paris he studied art, and on returning to the United States at the age of 18 became a pupil of the Boston artist William Morris Hunt. Making little progress in painting, he entered Harvard University in 1861, studying for three years in the Lawrence Scientific School and then enrolling in the medical school. As assistant to Louis Agassiz, he accompanied the university's zoological research expedition to Brazil in 1865, and on returning continued his studies at Harvard medical school, taking his degree in 1869 after studying for 18 months in Germany under Hermann L. F. Helmholtz and other leading scientists. Because of failing health he was unable to practice medicine, and in 1872 began instead his long association with the faculty of Harvard as an instructor in physiology, anatomy, and hygiene. From 1875 his lectures dealt increasingly with the relation

between physiology and psychology, and in 1876, when appointed assistant professor of physiology, he brought about the establishment of the first laboratory for psychological research in the United States. He was assistant professor (1880-1885) and professor (1885-1889) of philosophy, and professor of psychology from the latter date until 1897 when he was again named professor of philosophy, serving until his retirement in 1907. Already well known for his contributions to American and European scientific journals, James published his first book, *The Principles of Psychology*, in 1890. His work did much to establish psychology as an independent science and, abridged as *Psychology: Briefer Course* (1892), remained for many years the most popular American textbook on the subject. He was concerned for some years after with religion and its bearing on human experience. In 1897 he published *The Will to Believe and Other Essays in Popular Philosophy*, followed by *Talks to Teachers in Psychology and to Students on Life's Ideals* (1898) and *Human Immortality* (1899). His Gifford Lectures at Edinburgh University in 1901 and 1902 were published as *The Varieties of Religious Experience* (1902), one of his most significant works. From this time his published works were almost all in the field of philosophy.

James' lectures at the Lowell Institute in 1906 and others given at Columbia University the next year formed the basis of *Pragmatism: A New Name for Some Old Ways of Thinking* (1907), with which he took rank as the foremost American philosopher of his time, and throughout the English-speaking world was recognized as the brilliant exponent of a new approach to the theory of knowledge. Stated briefly, James' theory, whose origin he attributed to Charles S. Peirce (q.v.) and which was further developed by John Dewey (q.v.), was that the meaning of an idea, and hence its truth, consists in its consequences, both sensory and practical-emotional. Thus an idea that "works" in any desired manner is to that extent true.

The objections which this theory immediately called forth were answered by James in *The Meaning of Truth* (1909). The same year saw the publication of *A Pluralistic Universe*, the Hibbert Lectures delivered at Manchester College, Oxford, in 1908, setting forth his metaphysics, which was admittedly inspired by the French philosopher Henri Bergson.

James' essay, *The Moral Equivalent of War*, appeared in *International Conciliation* (February 1910). *Memories and Studies* (1911), *Some Problems of Philosophy* (1911), and *Essays in Radical Empiricism* (1912) were published posthumously. He was a founder of the American Society for Psychical Research (1884) and maintained throughout his life an interest in psychical phenomena for their value as psychological data if not as proof of human survival after death.

M., ed., *The Philosophy of William James* (New York 1925); Grattan, C. H., *The Three Jameses* (New York 1932); Perry, R. B., *The Thought and Character of William James*, 2 vols. (Boston 1935); id., *In the Spirit of William James* (New Haven 1938); Matthiessen, F. O., *The James Family* (New York 1947).

JAMES, William, English naval historian: d. London, England, May 28, 1827. An attorney in the admiralty court at Jamaica, B.W.I., from

1801, he was interned in the United States when the war of 1812 began, but escaped and reached Halifax, Nova Scotia. A number of letters on the conduct of the war, which he wrote to the *Naval Chronicle* over the signature "Boxer," gained him a reputation as a student of naval affairs, and his fame was extended with the publication in 1816 of *An Inquiry into the Merits of the Principal Naval Actions Between Great Britain and the United States*, which belittled American victories in the late war and was bitterly attacked in the United States for this reason. His major work was *The Naval History of Great Britain from . . . 1793 to the Accession of George IV* (5 vols., 1822-24; 2d ed., 6 vols., 1826), an exhaustive but one-sidedly pro-British account of the events of the period.

JAMES, Epistle of, the first of the seven "Catholic" (general) Epistles in the New Testament, which in ancient Bibles often followed the Book of Acts (as attributed to members of the original group of apostles) but later were shifted to follow the Epistles of Paul (including Hebrews). This led to the view that these were the earliest of the New Testament Epistles, and some writers still assume that James must be the first of all. Its Jewish background, discursive style, and strong moral tone support this view. Some scholars have argued that the Epistle was originally a Jewish work, perhaps a homily, taken over and Christianized in the apostolic age or soon after. But the author makes no claim to be an apostle; he is simply "James [Jacob], a servant of God and of the Lord Jesus Christ." He writes "To the twelve tribes in the dispersion";¹ but this may be either a Jewish or an early Christian phrase (compare 1 Peter 1:1-2; Galatians 3:29; 6:16; Philippians 3:3). Further, Jewish homilies were not as a rule ethical expositions in the style of James, but expositions of Scripture. The author of this epistle was familiar with the Septuagint (q.v.), and also with some of the terms of Greek popular philosophy; his chosen literary form is that of the Stoic-Cynic "diatribe" or ethical discourse delivered on the street corners in the 1st and 2d centuries. He uses many contrasts (for example, the double meaning of *peirasmos* as both trial and temptation; 1:2-18). He castigates the "double-minded" (1:5-8) who cannot let go his reliance on earthly advantages and trust God alone, and also the rich who oppress the poor (5:1-6), and the obsequious who fawn upon the well to do (2:1-7). The subject matter of the little treatise resembles that of the Sermon on the Mount in Matthew (chaps. 5 to 7). It also resembles the *Didache* (q.v.) and other early Christian writings with a strong ethical emphasis.

It has often been supposed that the author had in mind St. Paul's teaching when (2:14-26) he condemned "faith without works" as "dead," and insisted, "Show me your faith apart from your works, and I by my works will show you my faith." (Martin Luther described James as "an epistle of straw"!) But it is more probable that he had in mind the neglect of religious duty which often went with the overintellectualizing of faith in the Hellenistic age and also was criticized by Paul (for example, 1 Corinthians, chaps. 1 to 4), but which in time tended to seize upon Paul's doctrine of "justification by faith" in support of its own attitude and outlook. Religion

which exhausts itself in discussion and debate or in evolving a superior "wisdom" is not "true religion" (1:26-27). Whatever its date (probably late in the 1st century) and authorship, the epistle provides strong evidence that ethics was fully as important as theology in the early Christian church.

S. C. Williams (Fair Lawn, N.J., 1953).

FREDERICK C. GRANT,
Professor of Biblical Theology, Union Theological Seminary, New York City.

JAMES BAY, inlet, Canada, the southernmost arm of Hudson Bay, named in honor of Capt. Thomas James, an English navigator, who explored it in 1631-1632. The bay is about 275 miles long and 135 miles wide. It contains a number of islands, the largest, Akimiski, being about 60 miles in length. Several large rivers flow into James Bay. The largest of these are the Moose, which is the estuary of the Abitibi, Mattagami, Missinaibi, and other rivers; and the Albany, Nottaway, and Eastmain rivers. Moose Factory, at the mouth of the Moose River, on the southern shore adjacent to Moosonee, is the most important Canadian trading station, next to York Factory, of the Hudson's Bay Company.

JAMES ISLAND, island, South Carolina, one of the Sea Islands, forming part of the southwest side of Charleston Harbor. It is about nine miles long, and is famous for its sea-island cotton. James Island is separated from the city of Charleston by the Ashley River and the South Channel of the harbor, here a little over a mile wide. On the northeast coast of the island is Fort Johnson and nearby a former quarantine station. Just northeast of the island is Fort Sumter (q.v.). The Battle of Secessionville (see SECESSIONVILLE, BATTLE OF), fought on June 16, 1862, and several other engagements of the Civil War, took place on this island.

JAMES OF COMPOSTELA, SAINT. See JAMES, SAINT (the Greater).

JAMES RIVER (known also as DAKOTA RIVER), river, North and South Dakota, with headwaters near the southern end of Devils Lake in central North Dakota. It flows southeast, following the valleys formed by glaciers, and joins the Missouri River at Yankton, S.Dak. The river, 710 miles long, is not navigable. In its course, it passes the cities of Jamestown, N.Dak., and Huron and Mitchell, S.Dak. Along its banks are remnants of dwellings of the ancient mound builders. Fur-trading posts were located along the river, especially in Brown and Spink counties (S.Dak.) and near the river's mouth. New settlements grew up along the river after 1870.

JAMES RIVER, river, Virginia, one of the largest in the state, formed by the junction of the Jackson and Cowpasture rivers near Iron Gate (Alleghany County) in the Allegheny Mountains, about 15 miles from the West Virginia border. It flows in a winding, easterly course,

¹ Revised Standard Version text used throughout.

about 340 miles, past Buchanan in Botetourt County; northeast through the Blue Ridge Mountains, where a drop in its gorge produces scenic Balcony Falls; southeast to Lynchburg; northeast to Scottsville; then generally southeast past Richmond to Hampton Roads, the broad channel at its mouth, through which it enters Chesapeake Bay. For a distance of about 100 miles from its mouth, the James is a tidal stream, with the head of navigation just below Richmond. In its lower course it receives the Appomattox River from the south at Hopewell, and the Chickahominy from the north near Williamsburg. A 3-mile series of rapids over an 84-foot drop above Richmond is utilized for water power. A bridge (4½ miles long) spans the river above Newport News. The Port of Hampton Roads at the James' mouth is a center for shipbuilding, trade, and numerous federal government activities, including a major naval base. The first permanent English settlement in North America was made on Jamestown Island in the river (1607); it is now the site of historical monuments (see JAMESTOWN, Virginia).

JAMESON, jām's'n, **Anna Brownell** (nee MURPHY), Irish author and art critic: b. Dublin, Ireland, May 17, 1794; d. Ealing, Middlesex, England, March 17, 1860. Her father was a painter of miniatures, who moved to England in 1798 and was attached for a time to the household of Princess Charlotte, daughter of the prince regent. Anna worked as a governess from the age of 16 until her marriage (1825) to Robert Jameson, a barrister, from whom she was separated after four years. He later became a distinguished judge in Canada. Her first literary success was *Diary of an Ennuyée* (1826), based on her travels on the Continent as a governess. A series of other travel books and sketches of famous women followed, the best of which was *Characteristics of Women* . . . (2 vols., 1832), on Shakespeare's heroines. In later years she made a more enduring reputation as a writer on art, beginning with *A Handbook to the Public Galleries of Art in and near London* (2 parts, 1842), a catalogue of the pictures, accompanied by critical, historical, and biographical notes. Her major work was a series of books on religious art, which she illustrated with etchings of famous pictures: *Sacred and Legendary Art* (2 vols., 1848), *Legends of the Monastic Orders* (1850), and *Legends of the Madonna* (1852).

JAMESON, **Horatio Gates**, American surgeon: b. York, Pa., 1778; d. New York, N.Y., Aug. 26, 1855. He studied medicine with his father and began to practice in rural Pennsylvania when he was only 17. After 18 years he took a medical degree at the University of Maryland and established his office in Baltimore, where he became a leading surgeon. Jameson was the first American surgeon to remove a scirrroid tumor of the uterus and one of the first to perform a ligature on the external iliac artery. With Philip Syng Physick, he pioneered in the use of animal ligatures. He played a leading part in public health work in Baltimore and from 1827 to 1851 conducted his own institution, the Washington Medical College, there.

JAMESON, **J(ohn) Franklin**, American historian: b. Somerville, Mass., Sept. 19, 1859; d. Washington, D.C., Sept. 28, 1937. Graduated from Amherst College in 1879 (Ph.D., Johns

Hopkins, 1882), he was professor of history at Brown University (1888-1901) and then at the University of Chicago, which he left to become director (1905-1928) of the Department of Historical Research of the Carnegie Institution in Washington, D.C. In this position Jameson directed an intensive study of federal government archives, which led eventually to the establishment of the National Archives Building and the National Historical Publications Commission. He also organized a wide search of government records in European and other American countries for documents relating to United States history. Among the fruits of this work was the series *Original Narratives of Early American History* (19 vols., 1906-17), of which he was general editor. Jameson was one of the founders of the *American Historical Review* and its managing editor (1895-1901, 1905-1928). As chairman of the Committee of Management, he played a leading part in the publication of the *Dictionary of American Biography* (20 vols., 1928-36). From 1928 until his death he was chief of the Manuscripts Division of the Library of Congress. His books include *The History of Historical Writing in America* (1891) and *The American Revolution Considered as a Social Movement* (1926). He also supervised compilation of the *Census of Medieval and Renaissance Manuscripts in the United States and Canada* (3 vols., 1935-40).

JAMESON, **SIR Leander Starr** (known as DOCTOR JAMESON), South African statesman: b. Edinburgh, Scotland, Feb. 9, 1853; d. London, England, Nov. 26, 1917. After practicing medicine briefly in Edinburgh, he went to South Africa in 1878 and became the close friend and confidant of Cecil Rhodes in Kimberley. Rhodes, who had formed the British South Africa Company as part of his plan to expand British rule north of the Transvaal, sent Jameson in 1889 to negotiate with the Matabele chief Lobengula for goldmining rights in the area. Jameson's tact and medical skill overcame the chief's objections, and Rhodes' expedition set out in 1890. Jameson accompanied it into Mashonaland and in 1891 was appointed administrator of what became the nucleus of Rhodesia. In the Matabele rising of 1893 he accompanied an armed column to Bulawayo, where he remained after the flight of Lobengula and established a British administration over Matabeleland.

By 1895 the internal struggle in the Transvaal between the government of President "Oom Paul" Kruger and the Uitlanders (mainly British settlers) had led to the belief that a rising by the latter was imminent. Jameson, at the head of a small force of British South Africa Company police and volunteers, marched to the border to help his compatriots and, without orders from Rhodes, invaded the Transvaal on Dec. 29, 1895, in what has gone down in history as the Jameson Raid. On Jan. 2, 1896, they were surrounded by the Boers near Doornkop, and compelled to surrender. The British government repudiated Jameson's action. He was brought back to England, tried, and sentenced in 1896 to 15 months' imprisonment, but was released after 4 months on account of illness.

Jameson returned to South Africa in 1899, when the South African War began, and was elected to the Parliament of Cape Colony in 1900. By 1904, following Rhodes' death in 1902, he was the recognized leader of the Progressive Party.

In that year he became prime minister of Cape Colony, holding that office until 1908. His administration was marked by economy, internal reforms and a sincere desire to reconcile the conflicting elements of Boer and Briton. Rhodes' great dream of union in South Africa was unswervingly pursued by Jameson, and it was in a large measure due to his efforts that that ideal was realized in 1909. The policy which he stamped upon the Unionist Party at the Bloemfontein Conference in 1910 has been maintained to the present day. From 1908 to 1912 he sat in the opposition; in the latter year illness compelled him to resign and return to England. He was created a baronet in 1911. In 1913 he was elected president of the British South Africa Company, of which he had been a director since 1902.

Jameson is buried next to Rhodes in the Matopo Hills, near Bulawayo, Southern Rhodesia.

JAMESON, Robert, Scottish mineralogist: b. Leith, July 11, 1774; d. Edinburgh, April 19, 1854. In 1800 he went to Freiberg, Saxony, to study natural history under Abraham Gottlob Werner, and in 1804 was appointed to the professorship of natural history in the University of Edinburgh. In 1809 he published *Elements of Geognosy*, in which he gave a comprehensive exposition of the neptunian theory as modified by Werner. In 1819, with Sir David Brewster, he founded the *Edinburgh Philosophical Journal*, of which he became editor. Others of his principal works are *System of Mineralogy* (1804-1808); *Manual of Minerals and Mountain Rocks* (1821); *Elements of Mineralogy* (1840). He was a fellow of almost all the learned societies of Europe.

JAMESON RAID. See JAMESON, SIR LEANDER STARR.

JAMESONITE, jām'sūn-īt, a sulphide of lead and antimony, $Pb_2Sb_2S_5$. Known as feather ore and a minor source of lead in various mines in Arizona, California, Nevada, South Dakota and Utah. It is named for Robert Jameson (1774-1854).

JAMESTOWN, jāmz'toun, city, New York; in Chautauqua County; altitude 1,315 feet. It is situated at the southern end of Chautauqua Lake, 57 miles south-southwest of Buffalo, and is served by the Erie and the New York Central railroads; it has regular air service. The region surrounding this industrial city is agricultural, with truck and dairy farms, orchards, and vineyards.

Jamestown is one of the leading cities in the United States in the manufacture of furniture. In its early days woodworkers in the settlement made wooden furniture for their pioneer neighbors, and this activity developed into an important industry. Leading manufacturers of metal furniture are also located here. In addition to furniture, both of wood and of metal, Jamestown factories produce filing cabinets and other metal articles of office equipment, voting machines, washing machines, metal doors and window frames, textiles, mattresses, mirrors, kitchen cabinets, and sinks, ball bearings, toys, and automobile parts.

The city has a public library, the James Prendergast Free Library, named after the founder of the town, for whom the city itself was named. It was Prendergast who bought

here 1,000 acres of land, originally purchased by his brother from the Holland Land Company at \$2 an acre. Jamestown has a business college and a community college, a music association, a civic forum, and a Little Theater. The proximity of the famous Chautauqua Institution brings many visitors here annually. Jamestown was the home of Senator Reuben E. Fenton; his memory is honored in a memorial park, in which are his old home and a bronze statue of him.

The first permanent settlement at the outlet of Chautauqua Lake was made about 1806. The site proved attractive and in 1849 Swedish immigrants settled here. After the Civil War others came, most of whom were cabinet makers, drawn here by the furniture industry. The population of Jamestown became largely Swedish. It was incorporated as a village in 1827, and as a city in 1886.

Jamestown is governed by a mayor and council. The water supply system is municipally owned, the water coming from artesian wells. The city also owns and operates the system of generating and distributing current for light and power. Pop. 41,818.

JAMESTOWN, city, North Dakota; seat of Stutsman County; altitude 1,410 feet. It is situated on the Dakota (James) River, 95 miles west of Fargo, and is served by the Northern Pacific and the Midland Continental railroads. There is an airline service. The surrounding region is agricultural, in which wheat growing and the raising of livestock are important activities. The city manufactures flour, cereal foods, and dairy products, and has bottling works. There are a public library, a radio station, two general hospitals, a state hospital for the insane, and the North Dakota School for Crippled Children. The site of Fort William H. Seward, abandoned in 1877, is on the outskirts of Jamestown. The city is the seat of Jamestown College (coeducational), and of a business college. Jamestown was settled in 1871; incorporated in 1896. Government is by mayor and council. Pop. 15,163.

JAMESTOWN, town, St. Helena, South Atlantic Ocean; port and capital of that British island. It was formerly a naval coaling station of great importance, but this activity declined following the opening of the Suez Canal. It has an observatory. Nearby is the tomb in which the body of Napoleon lay until it was transported to Paris in 1840. Pop. (1959) 1,568.

JAMESTOWN, former village, Virginia; in what is now James City County; site of the first permanent English settlement in the United States, and capital of Virginia, 1607-1699. It was founded May 14, 1607 by the Virginia Company of London, on what was then a marshy peninsula (now Jamestown Island) of the James River, about 32 miles from its mouth. The settlement originally consisted of a triangular blockhouse and several huts; these were destroyed by fire in 1608, but soon rebuilt. By 1609 there were some 50 wooden structures, a chapel, and a storehouse, all surrounded by a palisade with a fort at the neck. During the winter of 1609-1610, the settlement was almost wiped out by famine, and the survivors abandoned the site June 7, 1610. Already embarked on ships for the return to England, they met Thomas West, baron De La Warr (Lord Delaware) at the mouth of the James.

De La Warr brought with him supplies and additional colonists; the settlers turned back and reoccupied the village.

By 1619 the colony had attained some degree of stability; tobacco cultivation was introduced, and plantations established to the east and west, along the river. Peaceful relations with the Indians contributed to this period of comparative prosperity. In this year, the first legislative body to meet in the United States convened at Jamestown; 1619 also marked the bringing of the first Negro slaves to Virginia. In the great Indian massacre of 1622, Jamestown suffered less than the surrounding plantations, having been warned before the Indians struck. During Bacon's Rebellion (q.v.) in 1676, the village was again burned and rebuilt; and in the last decade of the century, fire swept it once more. This final disaster, coupled with the removal of the capital to the Middle Plantation (now Williamsburg), in 1699, depopulated the village, and it fell into decay.

The peninsula on which Jamestown was built had become an island by the middle of the 19th century. It was not until 1893, when the Association for the Preservation of Virginia Antiquities began its work, that an effort was made to retrieve what remained of the site. In 1900 the association induced the federal government to build a sea wall to prevent further erosion of the island. About 23 acres on the upper end of the island are owned by the association; the remainder is part of the Colonial National Historical Park, established as the Colonial National Monument, Dec. 30, 1930.

Jamestown is visited by more than 100,000 persons each year. Points of interest on the site include the old church tower, dating from the middle of the 17th century; foundations of the state houses; the Robert Hunt Memorial Shrine, erected in honor of the man who conducted the first Anglican communion in America, in 1607; the statues of Pocahontas and John Smith; and the federal monument, built in 1907, commemorating the 300th anniversary of the founding of the colony, which was the occasion of the Jamestown Tercentennial Exposition, held April 26 to Nov. 30, 1907. Significant work is being done here in the Jamestown Archaeological Laboratory which contains many 17th-century relics unearthed during excavations by the National Forest Service. The colonial park area includes also parts of the city of Williamsburg, the Yorktown Battlefield, and the Cape Henry Memorial at Cape Henry.

JAMESTOWN COLLEGE, Jamestown, N. Dak., a coeducational, liberal arts institution. It was founded in 1883 by the Presbyterian Church and was the first institution in the state to offer normal school training for teachers. The financial panic of 1893 closed its doors temporarily, but it reopened in 1909. There are about 350 students.

JAMI, jā'mī (so called from his birthplace; in Persian *NUR UD-DIN 'ABD-UR-RAHMAN IBN AHMAD*), Persian poet and mystic: b. Jam, Khusasan, 1414; d. Herat, Nov. 9, 1492. He received an excellent education as is evident from his polished style. Jami was the last great classic poet of Persia and was deeply versed in philosophy. In three *Diwans*, appearing from 1479 to 1491, are his odes and lyrical poems. His principal prose work is the *Baharistan* (1847), a col-

lection of short didactic tales. Other works are in the collection *Haft Aurang* (*Seven Thrones*). The *Baharistan* has been translated into English several times. Edward Fitzgerald translated *Salaman wa Absul* from the *Haft Aurang* collection, in 1856, and *Yusuf wa Zalikha*, a version of the story of Joseph and Potiphar's wife, was translated by R. T. H. Griffith in 1882.

JAMIESON, jā'mī-s'n, John, Scottish lexicographer: b. Glasgow, March 3, 1759; d. Edinburgh, July 12, 1838. He was educated at the University of Glasgow and also studied for a short time in Edinburgh. In 1781 he was licensed to preach and became pastor of an Antiburgher congregation at Farfar; in 1797 he accepted a call to the Nicholson Street Antiburgher Church of Edinburgh. Jamieson's reputation as a man of letters rests on his *Etymological Dictionary of the Scottish Language* (1808; supplements in 1825). It is a work of great industry and considerable value as a collection of Scottish words, phrases, and customs, but as first published had little critical or philological merit, according to modern standards. The philological department was greatly strengthened in the edition of 1879-1887 by David Donaldson and John Longmuir. Jamieson also published *Ancient Culdees of Iona* (1811); *Hermes Scythicus, or the Radical Affinities of the Greek and Latin Languages to the Gothic* (1814).

JAMMU, jūm'ōō, town, India; in Kashmir; chief town of the region of the same name. It is situated on the river Tawi, a tributary of the Chanab, 85 miles north-northeast of Lahore. Extensive ruins attest the former splendor of the town. Jammu, which is the winter capital of Kashmir, is the terminus of a railroad linking it with the Indian railroad system. Coal mines are operated in the vicinity. The region of Jammu, formerly an independent kingdom, was conquered in 1820 by Gulab Singh (d. 1857); he joined Kashmir to it in 1846. Pop. (1941; including cantonment) 58,847.

JAMNITZER, yām'nīt-sēr, or **JAMITZER**, yā'mīt-sēr, Wenzel, German goldsmith: b. Vienna, 1508; d. Nürnberg, Dec. 19, 1585. Early in life he went with his family to Nürnberg, and in 1534 was admitted to the guild of master craftsmen. Subsequently he was appointed goldsmith to the court, serving successively the emperors Charles V, Ferdinand I, Maximilian II and Rudolf II. Specimens of his handiwork include a jewel box in the collection of the Dresden Palace, a gilt silver table piece in the Rothschild collection, Paris, statuettes in the treasury of Vienna, a jewel box in the Munich Treasury, and a cup which belonged to William II of Germany.

Wenzel's brother, ALBRECHT, worked with him until 1550. Wenzel's grandson CHRISTOPH (1563-1618) was a designer of ornamental works and an engraver. His *Groteskenbuch* (1610) contains 63 fantastic engravings.

JAMSHEDPUR, jā'm'shēd-pōōr, city, India; in southern Bihar. It is situated at the confluence of the Subarnarekha and Karkhai rivers, 140 miles west of Calcutta. The city was founded in 1909 as the headquarters of the Tata Iron and Steel Company, the largest concern of its kind in India, and was named for Jamsetji Tata, who

first advocated the exploitation of the iron and coal deposits. The center of the Indian iron and steel industry, Jamshedpur has large iron and steel works, railroad shops, and machine factories. Pop. (1941) 148,711.

JAN MAYEN, yān mī'ēn, island, Arctic Ocean, belonging to Norway. It is 360 miles north-northeast of Iceland; area 144 square miles. The island is volcanic, with an irregular surface, mountainous near the extinct volcano, Beerenberg, 8,347 feet high. One of the active volcanoes is about 1,500 feet high. There are some large glaciers on the island, one near Beerenberg. The island was named after Jan Mayen, a Dutch navigator, who visited it in 1611. Later it was ascertained that Henry Hudson had discovered it earlier, in 1607. It was frequently visited later by sealers, whalers, and scientists, and in 1921 a Norwegian observatory was established on the island. On May 8, 1929 Norway annexed Jan Mayen, and that country's sovereignty was subsequently recognized by other powers.

JANACEK, yā'nā-chěk, **Leoš**, Czech composer: b. Hukvaldy, Moravia, July 3, 1854; d. Ostrau, Czechoslovakia, Aug. 12, 1928. In 1865 he became a chorister in the Augustinian monastery at Brno (Brünn), where he studied under the Moravian nationalist composer Paval Křizhovsky. Janáček later studied at Prague, Leipzig, and Vienna. In 1881 he founded the Organ School at Brno, where he taught until 1920, then becoming professor at the conservatory in Prague.

Due to the veneration in which musical circles in his own country held the tradition of Bedřich Smetana (1824-1884), Janáček received little recognition until 1916, when his opera *Její Pastorkyňa* (*Her Foster Daughter*), which had been performed at Brno in 1904, was presented at the Vienna Court Opera in a German version, as *Jenufa*. The melody of his national speech, which he studied in great detail, is the basis of his music, and translations of his vocal works are notoriously difficult due to the intimate relationship of speech tone and melody.

Among his more important other works, with dates of composition are the operas *Sárka* (1887), *Výlety Páně Broučkovy* (*The Exclusions of Mr. Broucek*, 1914), *Kač'a Kabanova* (1919-1921), *Lyška Bystrouška* (*The Cunning Little Vixen*, 1921-1923), *Več Makropulos* (*The Makropulos Affair*, 1923-1924), and *Aus einem Totenhaus* (*From a House of the Dead*, performed 1930); many choral works, including *Zápisn k Zmizeleho* (*The Day-Book of One Who Vanished*, 1916); orchestral works; chamber music; and songs.

JANAUSCHEK, yā'nou-shěk, **Fanny** (in full FRANZISKA MAGDALENA ROMANCE), Bohemian actress: b. Prague, July 20, 1830; d. Amityville, N. Y., Nov. 28, 1904. She first appeared on the stage at Cologne, playing in that city and also in Frankfurt am Main, 1848-1860, and subsequently in Dresden and the principal cities of Germany, becoming a leading tragedienne. She made her first tour of the United States in 1863, playing in the German language and receiving most favorable notices. She later studied English and after 1869 played the most exacting Shakespearean roles in that language. After further tours of Europe and the United States, she made the latter country her home in

1880. Fanny Janauschek was best known for such roles as Lady Macbeth; Medea; Mary, queen of Scots; and Meg Merrilies. Changing styles of drama, however, gradually deprived her of her audiences.

JANE, jān, **Frederick T.**, English naval author: b. Aug. 6, 1870; d. Southsea, Hampshire, March 8, 1916. He was educated at Exeter School, invented the naval war game, and was naval correspondent of the *Engineer*, the *Scientific American*, and the *Daily Chronicle*. A prolific writer on naval affairs, he published many books on the subject, and in 1897 founded, and became first editor of the authoritative annual *Jane's Fighting Ships*. In 1909 he founded a companion work entitled *Jane's All the World's Aircraft*.

JANE EYRE, a novel by Charlotte Brontë, published under the pseudonym "Currer Bell" in 1847. For its day, it was a most unconventional novel. It came in the wake of sentimental novels in which the heroines were perfect and lifeless beings, and the heroes were all handsome and correct in their conduct. Against this unreality *Jane Eyre* was a protest, highly emotional, not to say hysterical. The author, the daughter of a Yorkshire clergyman, had grown up amid the hard surroundings of a bleak parish on the moors, and of boarding schools where the children were ill treated and ill fed. At the age of 30 she decided to put her own rebellious spirit into a novel, which should also follow in some degree the details of her own life.

Instead of being rich and beautiful, Jane Eyre is a poor and obscure girl, very small and plain in stature, with pale cheeks and green eyes. But she has a keen intelligence, and is thoroughly honest, outspoken and brave. In this heroine of a new type, Charlotte Brontë sought to depict a young woman who should be true to her opinions, true to herself, under all circumstances, whatever might be the consequence to herself or to others. Likewise the hero, Edward Rochester, was of a kind new to fiction. He was unshapely, his features were large and distorted and he had had an unsavory past. Nevertheless Jane Eyre fell in love with him, to the consternation of readers. There had never been in fiction any proposal of marriage like Rochester's, nor any acceptance like Jane Eyre's, on that moonlit night which ended in thunder and lightning and a deluge of rain.

Though the novelty of *Jane Eyre* has partially worn away, it still remains a most interesting story. It was admired by Thackeray, to whom the second edition was dedicated; and Trollope praised its just balance between the ordinary incidents of real life and extraordinary occurrences, such as an interrupted marriage, strange premonitions, dreams and a spectre. *Jane Eyre* was a sincere book, written by the sincerest of women.

WILBUR L. CROSS.

JANESVILLE, jānz'vīl, city, Wisconsin; seat of Rock County; altitude 800 feet. It is located on both banks of the Rock River, 32 miles southeast of Madison, and is served by the Chicago and North Western, and the Chicago, Milwaukee, St. Paul and Pacific railroads. It has regular air service. A center of trade for a region of dairy farming and the growing of grains

and tobacco, Janesville has diversified industries, the products of which include automobiles, automobile bodies, fountain pens, woollens, cotton goods, thread, shades and awnings, and metal fencing. The educational, civic, and cultural resources of the city include good schools, a public library, hospital, civic music association, Little Theater, and service and social clubs. Janesville has the lowest illiteracy percentage among Wisconsin cities. Its public park system is recognized as one of the best in the state. The Wisconsin State School for the Blind is located here. This school, established as a private enterprise, was acquired by the state in 1850, and ranks as the oldest among Wisconsin's welfare institutions.

Janesville is one of the oldest cities of the state. It was first settled in 1835. Incorporation was effected in 1853, and the city became the county seat in 1859. Local points of interest include a soldier's monument; the birthplace of Carrie Jacobs Bond, composer of popular songs; and the one-room schoolhouse where Frances E. Willard taught. The city was named in honor of Henry F. Janes, an early settler. It has the council-manager form of government. Pop. 35,164.

JANET, zhâ-ně', **Pierre Marie Félix**, French psychologist and neurologist; b. Paris, May 30, 1859; d. there, Feb. 24, 1947. He was educated at the École Normale Supérieure and the École de Médecine, Paris. After teaching at several lycées, he was director of the laboratory of pathological psychology at the hospital of La Salpêtrière in Paris, 1889-1898; lecturer at the Sorbonne, 1898-1902; and professor of psychology at the Collège de France from 1902. He is known especially for his researches in mental pathology and his investigations of hysteria by the use of hypnosis.

Janet laid the foundation of automatic psychology in his *L'automatisme psychologique* (1889), and was the first to describe psychasthenia (*Les obsessions et la psychasthénie*; 1903). His other works include *L'état mental des hystériques* (1893); *Névroses et idées fixes* (1898); *The Major Symptoms of Hysteria* (1908; consisting of a series of lectures delivered at Harvard University); *Les méditations psychologiques* (1920); *De l'angoisse à l'extase* (1926, 1928); and *Cours sur l'amour et la haine* (1933).

JANEWAY, jân'wā, **Edward Gamaliel**, American physician; b. New Brunswick, N. J., Aug. 31, 1841; d. Summit, N. J., Feb. 10, 1911. In 1860 he was graduated from Rutgers College, and four years later from the College of Physicians and Surgeons in New York. He was professor of pathology and practical anatomy at Bellevue Medical College, 1872-1879; professor of diseases of the mind and nervous system, 1881-1886; professor of medicine, 1886-1892; and dean 1898-1905. He was also commissioner of health of New York City from 1875 to 1881, and president of the New York Academy of Medicine, 1897-1898. Janeway was one of the most eminent medical diagnosticians and consultants of his day in the United States.

Janeway's nodes, which he described, are small hemorrhagic lesions, generally on the palms and soles, resulting from bacterial endocarditis.

JANEWAY, Theodore Caldwell, American physician; b. New York, N. Y., Nov. 2, 1872;

d. Baltimore, Md., Dec. 27, 1917. The son of Edward Gamaliel Janeway, he was graduated from Yale in 1892 and from the College of Physicians and Surgeons, New York City in 1895. He immediately entered his father's office, serving at the same time as instructor in bacteriology at his alma mater. In 1898 he became instructor and later lecturer at Bellevue Hospital Medical College. He resigned in 1907 to become associate professor of clinical medicine at the College of Physicians and Surgeons and became Bard Professor of Medicine two years later. He was largely responsible for the merger of the Presbyterian Hospital with the College of Physicians and Surgeons, thus forming the nucleus of the medical center on Washington Heights, New York City. In 1907 he became secretary of the Russell Sage Pathological Institute and in 1911 a scientific director of the Rockefeller Institute for Medical Research. He was called to Johns Hopkins Hospital in 1914 to become professor of medicine and head of the hospital. He helped establish a post graduate school for the study of tuberculosis at Saranac Lake. When the United States entered World War I he took charge of the section of cardiovascular diseases of the Division of Internal Medicine. The heavy work thus put upon him led to his early death.

His chief published work was *The Clinical Study of Blood Pressure* (1904). He was perhaps the first to make routine use of this resource in the clinic and introduced the first practicable apparatus for this purpose, called for him Janeway's sphygomomanometer.

JANICULUM, jā-nīk'ŭ-lŭm, or **MONS AUREUS**, mōnz ô'rê-ŭs (modern MONTE GI-ANICOLO), a ridge a little more than three miles long on the west bank of the Tiber, opposite ancient Rome. It rises to a height of 300 feet above sea level and affords a fine view of the modern city, being immediately southeast of Vatican City. It was fortified as a defensive outpost at an early date. The Janiculum was first connected with Rome by the Sublician Bridge; the Aemilius Pons was added in 181 B.C.; the Pons Valentinianus in 366 A.D. It was included in the city limits by Augustus, becoming the 14th Ward (or Region) as Trans Tiberim (modern Trastevere), and was enclosed by a salient of the Wall of Aurelian (built 271-275 A.D.). Through the Porta Aurelia (modern Porta San Pancrazio) in the point of this salient, the Via Aurelia left the city. The Trans Tiberim was chiefly an industrial section, with water power supplied by the Aqua Traiana. The aqueduct of the Aqua Traiana was built by Trajan in 109 A.D. and restored in 1611 by Pope Paul V, hence the modern name of Acqua Paola.

JANIN, zhâ-nān, **Jules Gabriel**, French critic; b. St. Étienne, Department of the Loire, Feb. 16, 1804; d. Paris, June 20, 1874. He was educated at Saint Étienne and at the Collège Louis-le-Grand; studied law and became a private tutor in the Latin quarter of Paris; and then turned to literature, becoming editor, novelist, journalist and critic. He soon became a contributor to several papers, notably the Liberal opposition paper *Le Figaro* and the government paper *Quotidienne*, and in 1836 became connected as dramatic critic with the *Journal des Débats*, in the columns of which he wrote for nearly 40 years. He possessed a wonderful

piquancy of style and an airy grace of sentiment and wit, which made him a delightful retailer of small talk; as a critic, however, he was utterly inconsistent through lack of any general principles of judgment, and said the first thing that entered his mind, though fortunately his lack of judgment was linked with amiability. He was an indefatigable worker and was in constant demand by the publishers of Paris to review books, write prefaces, and do other literary work. Of his published works, one or two of which are remarkable both in substance and style, the following are noteworthy: *L'ane Mort et la Femme Guillotinée* (1829), which went through several editions; *Histoire de la littérature dramatique en France*, 6 vols. (1858), a selection of his weekly *feuilletons*, altered and remodeled so as to present a sketch of the history of the French stage and dramatic artists during nearly a quarter of a century; *Rachel et la tragédie*, a biographical and critical work upon that great tragic artist, with photographic illustrations (1859), and a translation of *Horace* into French, 6th ed. (1885). His *Oeuvres diverses*, 12 vols. (1876-1878), and *Correspondence* (1877) appeared after his death.

JANIN, jän'in, Louis, American mining engineer: b. New Orleans, La., Nov. 7, 1837; d. Santa Barbara, Calif., March 6, 1914. He did much to further the development of western mining. He was educated at Yale university, at the mining academy in Freiberg, Saxony, and at the school of mines in Paris. After practicing mining engineering in California, he turned his attention to the treatment of silver ores, especially on the Comstock lode in Nevada, and worked out a system to overcome the costly waste in extracting the metal from the ores. For a year during the 1870's he was adviser to the Japanese government about the development of the country's gold, silver and copper mines. Among the many young American engineers who received their early training with him were Herbert Hoover and John Hays Hammond.

JANINA or JANNINA. See IOANNINA.

JANIS, jän'is, Elsie (real name **ELSIE BIERBOWER**), American actress: b. Columbus, Ohio, March 16, 1889; d. Beverly Hills, Calif., Feb. 26, 1956. She made her stage debut in *The Charity Ball* at the age of eight in her native city, and soon began to tour the vaudeville circuits. A successful run in New York City in *When We Were Forty-one* (1905) brought her the starring role in *The Vanderbilt Cup* (1906). Other successes followed, and in 1911 she appeared in a play of her own, *A Star for a Night*. During World War I she won international fame as the "Sweetheart of the AEF," entertaining troops overseas. She later produced several editions of her own revue, *Elsie Janis and Her Gang*, retiring in 1928.

JANITSCHKEK, yän'ně-chěk, Hubert, Austrian art historian: b. Troppau, Silesia, Oct. 30, 1846, d. Leipzig, June 21, 1893. He was educated at the university at Gatz 1868-1873, and from the latter year until 1877 pursued the study of art history in Italy. From 1877-1879 he was custodian of the Austrian Museum of Art and Industry in Vienna, and was subsequently professor in the universities of Prague (1879), Strasbourg (1881) and Leipzig (1891). He was the author of the following biographies in Robert Dohme's *Kunst*

und Künstler collection: Andrea del Sarto, Bellini, Paolo Veronese, Il Tintoretto, and others, and also wrote *Die Gesellschaft der Renaissance in Italien und die Kunst* (1879); *Zwei Studien zur Geschichte der karolingischen Malerei* (1885); *Geschichte der deutschen Malerei* (1890); *Dantes Kunstlehre und Giotto's Kunst*.

His wife, **MARIE** (b. Vienna, July 23, 1859) became known as a poet and novelist, her principal works being *Legenden und Geschichten* (1885); *Im Kampf um die Zukunft*, an epic poem (1887); *Gesammelte Gedichte*, 2 vols. (1892); *Aus Alten Zeiten* (1900); the novels *Aus der Schmelde des Lebens* (1890); *Lichthungrige Leute* (1891); *Atlas* (1893); *Gott hat es gewollt* (1895); *Frauenkraft* (1900); *Harter Sieg* (1901), etc.

JANIUAY, hä-ně-wī, municipality, Philippine Islands, of the Province of Iloilo, Panay, situated 19 miles northwest of the city of Iloilo, near the Jalaur River. It lies in a hilly country raising rice and sugar cane, and petroleum has been reported in the vicinity. Pop. (1948) 44,348.

JANIZARIES, jän'i-zēr-ēz (Turkish *jenitcheri*, new soldiers), an infantry force of Turkey, first organized by the Sultan Orkhan about 1330, and in 1362 increased to about 10,000 by Amurath (Murad). Only Christian populations were levied upon for boy recruits who, during training, were instructed in the Islamic faith. Accorded special privileges, the janizaries formed an elite body of highest *esprit de corps* that more than once saved the empire. Boasting they had never fled in battle, they were the nerve and sinew of the Ottoman Army. The regular troops of janizaries at one time numbered 60,000 or more, but they were afterward reduced to 25,000. They were kept in barracks in Constantinople and a few other cities. The irregular troops amounted to 300,000 or 400,000, and were scattered among all the cities of the empire, in time of peace performing police duties. The janizaries who constituted the sultan's bodyguard became in time so dangerous and their insurrections so frequent that several unsuccessful attempts were made to reform or disband them. In 1826 they rebelled on account of a proposal to form a new militia, when the sultan, Mahmud II, having displayed the flag of the Prophet, and being supported by their commander in chief, defeated the rebels and burned their barracks, and many of them perished in the flames. A royal proclamation abolished the corps. As many as 15,000 were executed, and 20,000 banished.

JANK, yängk, Angelo, German artist: b. Munich, Oct. 30, 1868; d. there, Oct. 9, 1940. Educated at Munich Academy under Paul Höcker and Ludwig von Löfftz, in 1907 he was appointed to a chair there. He is best known for his execution of hunting scenes. In 1909 his *The Hunt* and *The Horsewoman* were exhibited at the Metropolitan Museum, New York. In addition to these he has executed *Mailed Defense*; *The Hurdle Race*, in the Elberfeld Museum; equestrian portrait of the duke of Saxe-Coburg-Gotha; *Princess and Swineherd*, in Munich. His colored lithographs are also well known.

JANKO, yön'kō, Paul von, Hungarian pianist and inventor: b. Totis, Hungary, June 2, 1856; d. Constantinople, March 17, 1919. He made his

musical studies at the Conservatory of Vienna and in Berlin under Heinrich Ehrlich. His execution on the piano was hampered through his inability to reach an octave. He therefore invented (1882) the keyboard known by his name and made several tours in 1886–1890 to show its practicability, first in London and later in New York City. The Jankó keyboard has six rows of keys placed fanwise in a semicircle, with three keys to each note, one below the other. Octave and chord fingering are much easier and simpler than on the standard keyboard. Jankó's chromatic keyboard can be attached to any pianoforte, grand, upright, or square. A Jankó Society was founded in Vienna in 1905 to promote the use of the new keyboard, but, despite the invention's undoubted merit, it did not come into popular use.

JANNES AND JAMBRES, jän'ěz, jäm'-brěz, the two Egyptian magicians who opposed Moses in the contest before the pharaoh of Egypt (Exodus 7:11–12, 22). The legend is that they were so much impressed by Moses' wondrous magic that they became his proselytes and accompanied the Israelites on their journey to the Promised Land. According to one account, they perished in the Red Sea crossing; according to another, they urged Aaron to make the golden calf and were killed in the ensuing turmoil. Jannes and Jambres are mentioned by St. Paul in II Timothy 3:8, in the apocryphal Gospel of Nicodemus (4th or 5th century A.D. in its present form), and in the anonymous *Apostolic Constitutions* (4th century A.D.). There are also several references to them in other ancient works. Both Pliny the Elder and Lucius Apuleius mention Moses and Jannes as the names of ancient magicians; Origen and Eusebius quote Numenius, a Greek philosopher of the 2d century A.D., as giving an account of the two magicians.

JANNET, zhà-ně', **Claudio**, French economist: b. Paris, France, March 22, 1844; d. there, Nov. 21, 1894. He was educated as an advocate and became professor of political economy at the Catholic Institute of Paris. A disciple of the sociologist-economist Pierre Guillaume Frédéric LePlay (1806–1882), he advocated social reform within the framework of existing institutions, to be achieved by moral influences rather than by state intervention. His principal works include *Les États-Unis contemporains* (1876; 4th ed., 1889; written after an extended stay in North America); *Le socialisme d'état et la réforme sociale* (1889); and *Le capital, la spéculation et la finance au XIX^{me} siècle* (1892), stressing political-cultural effects on economic development.

JANNEY, jän'ī, **Eli Hamilton**, American inventor: b. Loudoun County, Va., Nov. 12, 1831; d. Alexandria, Va., June 16, 1912. He served as a Confederate quartermaster in the American Civil War and then worked as a drygoods clerk in Alexandria. Despite his lack of mechanical experience, he began to experiment on an automatic coupling for railroad cars and in 1868 secured his first patent. In 1873 he patented an improved device, which remains the basic model for the couplers now in use; the Janney Car Coupling Company was formed the same year to manufacture the device. In 1888 railroads throughout the United States adopted the Janney coupler as modified by further improvements in the intervening years.

JANNEY, Samuel McPherson, American Quaker leader and author: b. Loudoun County, Va., Jan. 11, 1801; d. April 30, 1880. He left school at the age of 14 to work in a counting house, but continued his education through night classes and private study. To pay his debts incurred from an early business failure, he conducted a girls' boarding school, but his business ventures were secondary to his interest in literature and humanitarian work. For nearly 50 years he was influential in the Hicksite division of the Quaker sect, working for the emancipation of the Negro, for public schools, and for the economic betterment of Indians. His literary work includes the authorship of the biographies of two great Quakers, *The Life of William Penn* (1852) and *The Life of George Fox* (1853), valuable for their source material and fine scholarship. He also wrote the meticulous study, *History of the Religious Society of Friends, from its Rise to the Year 1828* (4 vols., 1860–1867), and his fascinating autobiography, *Memoirs* (1881).

JANNINGS, jän'ingz, Ger. yän'ings, **Emil**, German-American actor: b. Brooklyn, N.Y., July 23, 1887; d. Sankt Wolfgang, Austria, Jan. 2, 1950. His family returned to Europe when he was an infant, and he attended school in Germany before joining a traveling circus at the age of 16. He was discovered as an actor by the director Max Reinhardt and engaged at Berlin's Deutsches Theater, where he appeared in Shakespearean roles and in plays by modern European dramatists. During and after World War I he appeared in many German silent films, notably *Waxworks* (1924), *The Last Laugh* (1924), *Variety* (1925), and *Tartuffe* (1925). He went to the United States in 1926 and won stardom in several Hollywood productions, including *The Last Command* (1926) and *The Patriot* (1928). Because of his refusal to learn English, the advent of the talking motion picture caused him to return to Germany. He continued his film and stage work there and in Austria until his death. Probably his best-known motion picture performance was with Marlene Dietrich in *The Blue Angel* (1930).

JANOW, jän'ów, **Matthias von**, medieval theologian and reformer: b. probably Prague, Bohemia (now Czechoslovakia); d. there, Nov. 30, 1394. The son of a Bohemian knight, he studied theology at the University of Prague and later spent nine years at the University of Paris. While visiting Rome in 1381, he was appointed canon of the Cathedral of St. Vitus at Prague and confessor to Charles II, continuing in that office until his death. He had no oratorical ability, but through his writings exercised a remarkable influence on the religious thought of his time. His writings were collected in a work entitled *Regulae veteris et novi testamenti* (1392). In this book Janow denounced the corruption and evil that existed in the church, alleged gross misconduct of bishops and priests, and urged that all human additions to Christianity, both doctrinal and ceremonial, be eliminated and that the church return to its original beliefs and doctrines. He had advocated also the removal of images from the church and had recommended daily communion, but after the Synod of Prague (1389) had discouraged these reforms, he publicly retracted his opinions and vowed complete loyalty to the church. His writings

were declared heretical, and 16 years after his death were publicly burned with those of John Wycliffe. Janow has often been called a precursor of John Hus (q.v.).

JANS, yāns, **Anneke** or **Annetje**, Dutch colonist in North America; d. Albany, N.Y., 1663. She emigrated from the Netherlands in 1630 with her husband Roeloff Jansen, who secured in 1636 a grant on lower Manhattan Island for 62 acres of land, to which Anneke obtained a patent right in 1654. The possession of this property was subsequently the subject of numerous lawsuits. In 1671 some of her heirs sold the land to Governor Francis Lovelace. In 1673 it was confiscated by the British, who deeded it to Trinity Church in 1705. From 1749 this valuable property has been claimed by the descendants of Anneke Jans, chiefly on the legal grounds that the names of two heirs were omitted from the original deed of transfer, but the courts have always upheld the defendants.

JANSEN, jān's'n, Du. yān'sēn, **Cornelius** (Lat. CORNELIUS JANSENIUS), Dutch theologian: b. Acquoï, near Leerdam, the Netherlands, Oct. 28, 1585; d. Ypres, Belgium, May 6, 1638. He acquired his philosophical training at the Collège du Faucon, one of the University of Louvain's arts colleges, graduating 1st in a class of 118 students. He then transferred to the Collège du Pape Adrien VI, where he studied theology under Jacques Janson, the celebrated disciple of Michael Baius, whose influence was to color the whole of Jansen's career. Returning to Louvain in 1616, Jansen headed the Collège de Sainte-Pulchérie, taught theology, chiefly to Dutch students, and became noted for his lectures and commentaries. His scholarly pursuits centered on the revival of St. Augustine's doctrine of grace and free will, which, he believed, was neglected by the church. He denounced the Jesuits as Pelagians or Semi-Pelagians and in turn was opposed by them for his extremism. In 1636 he was named bishop of Ypres. Despite heavy administrative work Jansen managed to complete the theological treatise which he had begun many years earlier. It was published two years after his death under the title, *Augustinus, seu doctrina Sancti Augustini de humanae naturae sanitate, aegritudine, medicina, adversus Pelagianos et Massilienses*. In this work he expounded his main theses that original justice belonged to man's nature, that fallen man is radically corrupt, and that the redemption of Christ extended only to the predestinate, and the nonpredestinate lack grace to resist sin. These points of doctrine constitute the principles of the heresy known as Jansenism (q.v.). Jansen's extremist theological inclinations were not known during his lifetime, and he died in the good graces of the church. His complete heterodoxy became apparent only after the *Augustinus* had appeared in print and had been condemned by the church.

RAYMOND HAIN,
Department of Religious Education, Catholic
University of America.

JANSENISM, jān'sēn-iz'm, a 17th century religious doctrine on the nature of grace and free will taught by Cornelius Jansen (q.v.). The teaching was declared erroneous by the Roman Catholic Church and its adherents were labeled heretical. Essentially, Jansenism represents an antidog-

matic and antimystical reaction to traditional Christianity. Its basic divergences consist of a belief in the mutilation of human nature through Adam's fall, an acceptance of predestination with no allowance made for man's merits, and a denial of the universal salvific will of God. Practically, it presents a rigid application of moral principles, particularly with reference to dispositions required for worthy reception of Holy Communion.

Origin, Nature, and Condemnation.—Jansen imbibed his opinions from Jacques Janson, a disciple of Michael Baius, while at the University of Louvain. He denounced the Jesuit teachings on grace as Pelagian or Semi-Pelagian and rejected St. Thomas Aquinas' doctrine as opposed to St. Augustine's. For 20 years Jansen labored on a treatise supposedly designed to revive true Augustinianism. The full title of his work is *Augustinus, seu doctrina Sancti Augustini de humanae naturae sanitate, aegritudine, medicina, adversus Pelagianos et Massilienses*. Its orthodoxy was suspect from the very beginning. Notwithstanding a papal directive that no books dealing with grace and free will should be printed, the work was published secretly under the auspices of the University of Louvain in 1640. Urged by the Jesuits, Paul Richard Stravius, the papal internuncio, requested the university to stop publication. Later Pope Urban VIII ordered that this be done, but the decree came late. The book was rushed through the press and in the following year was reprinted in Paris with approval of the Sorbonne.

The work became the subject of public controversy. Several Catholic bishops and theologians favored its doctrine; Dutch Calvinists adopted the book for presenting their own teaching; the Jesuits denounced it most vigorously. The aging Pope Urban VIII failed to take immediate action, but his vice chancellor and nephew, Francesco Cardinal Barberini, invoked Pius V's ban on public discussion of points connected with the question of grace, and all writings related to the controversy were ordered confiscated. However, the heresy continued.

At length Urban VIII issued a bull, *In eminenti* (June 19, 1643), against the errors, stating that "a careful reading of the *Augustinus* has shown that it contains and defends many propositions which our predecessors have condemned, to the great scandal of Catholics and disrespect for the authority of the Holy See."

After the death of Jansen's close follower, the Abbé de Saint-Cyran (Jean Duvergier de Hauranne), in 1643, leadership of the sect passed into the capable hands of Antoine Arnauld (see ARNAULD). A gifted writer, scholar, and tenacious worker, the "Great Arnauld" directed the destinies of the group for over 50 years. Practical applications of the doctrine were made in various areas of theology. Arnauld's most notable contribution was the book *De la fréquente communion* (1643), in which he laid down conditions for the reception of the sacrament so exacting that the Eucharist could rarely be received.

In 1649 an official of the Sorbonne summarized the contents of the *Augustinus* in five propositions:

1. Some of God's commandments are impossible to the just, who desire and strive to keep them, with the powers that they have at present; the grace by which these commandments can be possible is also lacking.
2. In the state of fallen nature no one ever resists interior grace.

3. In order to merit or to demerit, in the state of fallen nature, freedom from external constraint is necessary, but not freedom from interior necessity.

4. The Semi-Pelagians admitted the necessity of interior preventing grace for all action, even for the beginning of faith; and they were heretics in teaching that this grace is such that men may either follow or resist.

5. It is Semi-Pelagian to say that Christ died or shed His blood for all men.

Efforts were made to interpret these in the light of St. Augustine's writings. However, on May 31, 1653, Pope Innocent X, successor to Urban VIII, condemned them as heretical.

Reaction to Papal Decrees.—The clever Arnauld found a way around the condemnation. He agreed that the five propositions were certainly heretical and deserving of censure, but, he maintained, they were not found in the *Augustinus* in the sense condemned. With this the conflict acquired a new character. Controversy now centered on the binding power of ecclesiastical judgments. Arnauld argued in effect:

(1) The church has a right to condemn error or false doctrine and is qualified to judge with regard to the revealed origin and heterodoxy of a truth.

(2) The fact as to whether error is found in a given work in the sense in which it was declared heretical is not within the scope of the church's power to decide.

Thus, with reference to the first (question of right), submission of the faithful was required; with reference to the latter (question of fact), the ecclesiastical judgment should not be challenged publicly, but interior assent need not be given.

Not all Jansenists accepted the escape offered by Arnauld. Blaise Pascal (*Lettres provinciales*, 1656) chided the Sorbonne for considering the distinction. At the same time he denounced the Jesuits for what he considered a casuistic corrupt moral doctrine. In 1656 the Assembly of Bishops at Paris branded Arnauld's distinction heretical, and Alexander VII, successor of Innocent X, in a bull, *Ad sanctam Petri sedem* (Oct. 16, 1656), explicitly condemned the five propositions in the sense taught by Jansen. On Feb. 15, 1664, he issued a constitution, *Regiminis apostolici*, whereby all ecclesiastics and religious were obliged to repudiate Jansenism under oath. Those refusing were made subject to canonical judgments. King Louis XIV sustained the pope in this action.

Peace of Clement IX and Renewal of Conflict.—Alexander VII was succeeded by Clement IX in 1667, when Gallicanism, quietism, and other problems held the attention of ecclesiastical authorities and when most Jansenists were confining themselves to a denial of the church's power to decide cases of fact. This period of quiet on the question came to be known as the "Peace of Clement IX."

In a few years, however, the old theories reappeared in connection with the "case of conscience"—that is, whether it was licit to absolve penitents who sympathized with certain Jansenistic theories. The practice was condemned by Clement XI (July 16, 1705) on grounds that ecclesiastical judgments required interior assent. A few years earlier, in 1687, had appeared Pasquier Quesnel's *Réflexions morales*, in which Jansen's errors were reiterated. Louis Antoine de Noailles, bishop of Châlons-sur-Marne and later cardinal archbishop of Paris, approved the book. After its condemnation by Clement XI, he found himself obliged to retract the approbation, but hesitated. Finally, on Sept. 8, 1713, in a bull, *Unigenitus*, 101 propositions taken from the *Réflexions* were anathematized by Clement XI.

De Noailles and four bishops appealed for a general council. The pope rejected the appeal and excommunicated the recalcitrants. In France 1 cardinal, 18 bishops, and about 3,000 clerics were, for all practical purposes, in schism. On the side of orthodoxy were 4 cardinals, about 100 bishops, and scores of clerics. The conflict continued until Cardinal de Noailles submitted to the Holy See in 1728.

This action dealt the cause a severe blow, and Jansenism has declined ever since then. Gradually followers were reduced to a mere handful except in the Netherlands. Several vicars apostolic to the Netherlands were favorably inclined toward the doctrine. Johann de Neercassel, apostolic vicar from 1663 to 1686, openly supported the movement and provided refuge for Jansenists driven from other nations. In 1723 a bishop was elected for the sect in the see of Utrecht and was consecrated by the excommunicated Bishop Dominique Varlet. The see is still maintained. Whenever a new bishop has been elected, Rome is notified and forthwith nullifies the election and excommunicates all persons concerned. In 1956 the sect had about 5,000 followers, most of whom were in the Netherlands.

JANSON, yän'sön, Kristofer Nagel, Norwegian novelist and educator: b. Bergen, Norway, May 5, 1841; d. Christiania (now Oslo), Nov. 17, 1917. Although educated for the ministry at the University of Christiania (Oslo), he became interested in the movement for popular education and established a popular high school in Sel, a district of Gudbrandsdalen, and later in Gausdal. He lived in the United States from 1879 to 1893, settling in Minneapolis, Minn., where he was the pastor of a Unitarian church and also the editor of a Norwegian language Unitarian newspaper, *Saamanden* (*The Sower*). Returning to Norway, he became the first writer of the new Norse dialect to be granted a poet's pension by the Norwegian Storting. Janson was much in demand as a lecturer because of his striking appearance, musical voice, and kindly manner. He was a friend of Björnsterne Björnson and imitated the style of this great Norwegian writer in his own work. His prose output was voluminous and his novels were once widely read in Norway, but his works lacked artistry and are now largely neglected. His major novels are *Han og ho* (1868); *Fraa Dansketidi* (1875); *Den bergtekne* (1876); tr. *The Spell-Bound Fiddler*, 1880); *Vore bedsteforældre* (1882).

JANSSEN, yän'sën, Johannes, German Roman Catholic historian: b. Xanten, Germany, April 10, 1829; d. Frankfurt am Main, Dec. 24, 1891. Educated at the universities of Louvain, Bonn, and Berlin, he was professor of history in the gymnasium at Frankfurt am Main in 1854. In 1860 he became a priest and 20 years later was appointed domestic prelate to the pope. He is chiefly known for his 8-volume *Geschichte des*

deutschen Volkes seit dem Ausgang des Mittelalters (*History of the German People from the End of the Middle Ages*), published between 1876 and 1894, the last two volumes posthumously. Written from a strictly Catholic point of view, it was attacked by Hans Delbrück and other historians.

JANSSEN, Peter, German painter: b. Düsseldorf, Germany, Dec. 12, 1844; d. there, Feb. 19, 1908. From his father Teodor Janssen, a noted engraver, he obtained his early art education. In his 16th year he entered the Art Academy at Düsseldorf and became a pupil of Eduard Bendemann (1811-1899) and of Carl Ferdinand Sohn (1805-1867). Appointed a professor at the same academy in 1877, he became its director in 1895. Janssen distinguished himself as a painter of murals. In 1872 he completed for the Bremen Exchange a huge wall painting representing *The Colonization of the Baltic Coast*, and two years later he decorated the walls of one of the halls of the National Gallery at Berlin with wax paintings dealing with the *Myth of Prometheus*. The murals he painted during 1880-1882 for the town hall at Erfurt, entitled *Momentous Episodes in the History of Erfurt*, are outstanding examples of Janssen's use of color and his talent for dramatic composition.

JANSSEN, zhān'sen', Pierre Jules César, French astronomer: b. Paris, France, Feb. 22, 1824; d. Meudon, Dec. 23, 1907. Graduating in 1852 as licentiate in mathematics and in 1860 as doctor in physics, his thesis on the absorption of dark radiating heat within the eye created widespread discussion. In 1853 he became temporary professor in the Lycée Charlemagne, and from 1865 to 1871 was professor of general physics in the Special School of Architecture. In 1857 he traveled to Peru to fix the location of the magnetic equator; from 1861 to 1864 he was in Italy observing the solar spectrum; and from the latter year until 1867 he was in the Azores with Charles Sainte-Claire Deville. In 1867 he visited Santorin, Greece, to study the volcano there, and in 1868 went to Guntoor, India, to observe the total eclipse of the sun, making special observations on the solar prominences. In 1870, during the Franco-Prussian War, he escaped by balloon from besieged Paris in order to observe in Algeria the solar eclipse. He watched the transit of Venus in Japan (1874). A year later he was astronomer for an English expedition to Siam, and also was appointed director of the astrophysical observatory at Meudon. Having founded an observatory on Mont Blanc in 1892-1893, he was appointed its director. (See also *ECLIPSE—Phenomena Observed in Total Solar Eclipses*.)

JANSSEN, yān'sēn, or JANSEN, Zacharias, Dutch spectaclemaker: b. The Hague, Netherlands, c. 1588; d. Amsterdam between 1628 and 1632. Active at Middleburg, he was credited with the invention of both the compound microscope and the telescope by the French physician Pierre Borel (1620-1689) in his *De vero telescopii inventore* (1655). However, though later historians tend to agree that Janssen together with his father Hans discovered the microscope, some authorities contend on the basis of Dutch documents that the discovery of the telescope belongs either to Hans Lippershey (d. 1619) or to Jacobus Adriaanszoon, both active at Middleburg

and Janssen's contemporaries.

JANSSEN VAN CEULEN, yān'sēn vān kù'lēn, Cornelius, English portrait painter: b. London, England, c. 1593; d. in the Netherlands, c. 1664. He worked at his art for many years and was rewarded in 1618 by appointment as the fashionable painter at the English court. He maintained his pre-eminence until Anthony van Dyck came to England and was made the official court painter. Janssen went to the Netherlands in 1643 and lived there until his death. His work is refined, shows infinite care, and portrays his powers as colorist. His original and skillful technique of throwing features into high relief by providing a dark background has seldom been excelled. His best portraits are those of Charles I, the Duke of Buckingham, John Milton as a boy, and *The Magistrates*. He is represented in many private collections, also in the collections of museums at Rotterdam, Lille, Dresden, and Brunswick.

JANSSENS, yān'sēns, Abraham (called JANSSENS VAN NUYSEN), Flemish painter: b. Antwerp, the Netherlands, 1575; d. there, Jan. 25, 1632. From early youth he showed aptitude for painting, and when 18 years of age became a pupil of Jan Snellinck. Admitted as a master to the Guild of St. Luke in 1601, he was the guild's dean from 1606 to 1607. Subsequently he visited Italy. One of the most distinguished of Romanist Flemish painters, contemporaries admired his excellent drawing, fine sense of color, and clarity of composition. Outstanding among his works are the *Madonna with Saints* and the *Entombment* in the Carmelite church at Antwerp; *The Descent from the Cross* in the Cathedral of St. Bavon at Ghent; *The Adoration of the Magi* in the Antwerp Museum; and *Venus and Adonis* and *Day and Night* in the Vienna Museum.

JANSSENS, Francis, Roman Catholic archbishop: b. Tilburg, The Netherlands, Oct. 17, 1843; d. on board steamer *Creole* voyaging from New Orleans to New York, N.Y., June 10, 1897. The son of a wealthy Catholic family, at the age of 13 he entered the seminary at Bois-le-Duc. In 1866 he was ordained subdeacon and the following year a priest. After further religious studies at the American college attached to the University of Louvain, he came to the United States in 1868, serving successively as pastor of the cathedral at Richmond, Va., as vicar general, and administrator of the diocese. Consecrated bishop at Natchez in 1881, he was appointed archbishop of New Orleans seven years later. A tireless worker, he improved the archdiocesan finances, opened in 1892 a mission, a free school, and an asylum for Italian orphans. With the help of Thomy Lafon, a Negro humanitarian, he provided for the needs of the aged colored. Largely through his efforts the Louisiana Lepers' Home was set up, also the Catholic Winter School of America.

JANUARIUS, jān-ū-ā'ri-ūs, SAINT (Ital. SAN GENNARO): b. 272?; d. Pozzuoli, Italy, Sept. 19, 305. Bishop of Beneventum in 303, he was beheaded at the time of the persecution of the Christians under Emperor Diocletian. The patron saint of Naples, his body lies in the crypt of Naples Cathedral. Two phials of his blood which, according to tradition, a pious matron

caught at his execution, are preserved in one of the chapels. The blood, on being brought near the head of the saint, is said to liquefy. A trial is made during three festivals a year, the chief being the anniversary of his martyrdom, and also whenever public danger exists or is imminent. If the blood moves briskly in the phials and appears of a clear red, San Gennaro promises well for his city; but if otherwise, it is an evil omen.

JANUARY, jän'ü-ër'ī, the first month of the year held by the Romans sacred to Janus (q.v.), from whom the name was derived. The Roman year originally began with March and consisted of 10 months, Numa Pompilius is said to have added January as well as February to the calendar. However, although the Romans as early as 251 B.C. had accepted January as the first month of the year, the nations of Europe did not universally adopt it as such till the 18th century. *Wulfmonath* was the Anglo-Saxon name for the first month. March 25th was the beginning of the ancient Jewish year, and that day instead of January 1 long held a legal position in Christian countries as the opening of the new year.

JANUS, jā'nūs, an ancient Latin divinity, after whom the first month of the year was named. Presiding over gates, doors (*janus*) and passages (*janua*), he was the protector of entrances and departures. Hence, he was sometimes represented as a porter or doorkeeper with a staff in the right hand and a key in the left. More commonly, however, he was depicted as on the Roman *as* of early coinage, with two faces, usually bearded, looking in opposite directions. Gradually, he was vested with more extensive attributes and was worshiped as god of beginnings, of the beginning of the year and of the month; of the beginning of day, opening the gates of heaven to let out the morning, and closing them when day returned, at dusk. As god of the beginning of time (*temporis auctor*) as well as of the world, he was invoked as "father" at the beginning of all solemn sacrifices. His priest was the *rex sacrorum*. Several sanctuaries, usually in the form of arches, were dedicated to Janus in Rome. The earliest of them, dedicated by Numa Pompilius, as depicted on coins consisted of two parallel arches facing east and west, connected by side walls and furnished with gates. According to an ordinance of Numa these gates were to remain always open in times of war. During the 700 years until the Christian era, they were closed only four times.

JANVIER, jän'vēr, Catharine Ann, American painter and author: b. Philadelphia, Pa., May 1, 1841; d. Merion, July 19, 1922. Born Catharine Drinker and educated at Hong Kong where her father was a merchant, she removed to Baltimore at his death in 1857, studied art at the Maryland Institute there, and then at the Pennsylvania Academy of Fine Arts at Philadelphia. She married Thomas Allibone Janvier (q.v.) in 1878 and with him traveled in Mexico, England, and France. At Saint Rémy, in Provence, she met the Félibrige (q.v.) writer Félix Gras and published in translation his *The Reds of the Midi* (1896), *The Terror* (1898), and *The White Terror* (1899). Mrs. Janvier is said to have been the first to identify William Sharp as the creator of *Fiona Macleod*. Her paintings

include *Geoffrey of Rudel and the Countess of Tripoli*, *The Princess Badroulbador*, and *The Guitar Player*. Several of her lithographs are in the New York Public Library collection.

JANVIER, Margaret Thomson, American author (pen-name MARGARET VANDEGRIFT): b. New Orleans, La., February 1844; d. Moorestown, N. J., February 1913. A sister of Thomas Allibone Janvier (q.v.), she was educated at home and New Orleans public schools. Her writings consist almost entirely of stories and verse for children. Among her better known works are *Clover Beach* (1880); *Doris and Theodora and The Absent-Minded Fairy* (both 1884); *The Dead Doll and Other Verses* (1889); and *Umbrellas to Mend* (1905).

JANVIER, Thomas Allibone, American journalist and author: b. Philadelphia, Pa., July 16, 1849; d. New York, N. Y., June 18, 1913. After a common school education in Philadelphia and a brief spell in business, he turned to journalism and from 1871 to 1880 was an editorial writer with the Philadelphia *Times*, the *Evening Bulletin* and the *Press*. Between 1881 and 1884 he visited Colorado, New Mexico, and Mexico, where he collected material for his books, *The Mexican Guide* (1886), *The Aztec Treasure House* (1890) and *Stories of Old New Spain* (1891). Settling in New York in 1884, he became interested in the history and antiquities of the city, as well as in the Bohemianism around Washington Square; he published *In Old New York* (1894), *The Dutch Founding of New York* (1903), and *Henry Hudson* (1909). A seven-year stay mainly in the south of France brought him and his wife into contact with Provençal literary circles. Among his books treating the life and customs of that region are *Embassy to Provence* (1893), *Christmas Kalends of Provence* (1902) and *From the South of France* (1912). He was made an honorary member of the Félibrige (q.v.) society. Other works are *The Uncle of an Angel*, and *Other Stories* (1891), *Legends of the City of Mexico* (1910).

JAOK, jā-ök', a large sculpin, *Myoxocephalus jaok*, common in the shallow waters along the Bering Sea and into the Arctic. Used locally as a food fish, it is from 12 to 18 inches long, olive grayish above and white below. Like other sculpins, it is capable of living for two days out of water, in cold weather.

JAORA, jou'rā, a former princely Indian state merged since 1948 with Madhya Bharat. Comprising two separate tracts between Neemuch (Nimach) and Ratlam, its area is 601 square miles. A fertile region, it produces cotton, Indian corn, opium and millet. Malwa opium is largely produced in Jaora. Ruled formerly by nawabs of Afghan rule, the native state was guaranteed independence by the British under the treaty of Mandsaur (Mandasor) of 1818. Pop. (1941) 116,953.

JAORA, town, India, and capital of the former princely state of the same name, situated on the Rajputana-Malwa railway, 22 miles north of Ratlam. The town has several substantial buildings of modern construction including a Zenana dispensary and a high school. Pop. (1941) 25,501.

JAPAN (Jap. *NIHON* or *NIPPON*), island empire of eastern Asia. Including the Amami Islands, restored to Japanese sovereignty in 1953, it has an area of 142,798 square miles; its population was 93,418,501 as of the census of 1960. The capital, Tokyo, had a population (1960) of 8,310,027. For administrative purposes, Japan is divided into 46 prefectures.

The basic monetary unit is the yen; in 1963 its value was officially at 360 to the U.S. dollar. The metric system is used for weights and measures. The national flag is white, with a red sun in the center.

The historical, social, and political development of Japan, its economy, religion, literature, arts, and science, are treated under the following headings:

- | | |

1. THE LAND. Japan is an insular mountainous land lying between the gigantic mass of the Asiatic continent and the profound oceanic depths of the Pacific Basin. The bulk of its area is included in the four main islands of Honshu, Shikoku, Kyushu, and Hokkaido, but there are many smaller islands adjacent to the larger ones. Between the Japanese islands and the eastern shore of the Asiatic continent lie the relatively deep Sea of Japan, whose maximum depth is 12,178 feet, and the very shallow East China Sea, which, for the most part, overlies the continental shelf. In sharp contrast, the mighty Tuscarora Deep, which occurs just off the eastern or Pacific shores of the Japanese islands, reaches a maximum depth of 30,659 feet.

Japan, without its pre-World War II possessions, is a small country in terms of land area, which totals only 142,798 square miles. The area of the more important islands follows, in square miles:

Honshu	88,031	Amakusa-shimo	220
Hokkaido	30,077	Yaku	193
Kyushu	13,768	Tane	173
Shikoku	6,857	Tsushima-shimo	168
Amami-O-shima	333	Fukae (Goto group)	126
Sado	331	Tsushima-kami	95
Awaji	228	Dogo (Oki group)	95

Topography.—The islands of Japan, without exception, are but a part of the insular arcs of the Western Pacific, which have been formed by the intensive orogenic processes of recent geologic time. Largely in consequence of this, they are composed primarily of high and rugged mountains and contain many volcanoes. These mountain-forming processes are still vigorously active, as is witnessed by the frequency of destructive earthquakes and of violent volcanic eruptions.

The arrangement of mountain ranges and depressed lowlands and the distribution of volcanoes indicate that the form and the major surface features of the Japanese islands are dominated by six main mountain systems. From northeast to southwest these are: (1) the mountain arc ac-

counting for the Kuril or Chishima Islands and continuing into Hokkaido from the northeast; (2) the mountains of Sakhalin or Karafuto entering Hokkaido at its northwest corner; (3) the Tohoku, or northeastern, range dominating the northern half of Honshu and the southern peninsula of Hokkaido; (4) the Seinan, or southwestern, system extending southwestward from central Honshu to form the backbone of the Chugoku Peninsula and to reach its greatest dimensions in the mountains of Shikoku; (5) the Shichito-Mariana chain reaching northward across central Honshu through the Pacific island groups from which its name is derived; and (6) the Ryukyu arc curving northward from Formosa to penetrate Kyushu. Where two or more of these mountain systems join, there occur high mountain masses or knots, extensive plains, and profuse groupings of volcanoes. In the central part of Honshu the Seinan and Shichito-Mariana arcs meet, and here are found the highest mountain lands of nonvolcanic origin in Japan. Here too occurs the Fuji volcanic group, with Mounts Fuji, Akaishi, and Hida (Ontake), whose summits reach 12,395, 10,456, and 10,444 feet, respectively. Also at this juncture of the two great arcs lies the greatest of Japan's lowlands, the Kanto plain. In Hokkaido, where the Tohoku, Kuril, and Sakhalin arcs join, is found the so-called Roof of Hokkaido, with complex clusters of mighty volcanoes. Another highland mass, with groups of volcanoes, is found in Kyushu where the Seinan and Ryukyu arcs meet. The axis lines of these great arcs are marked by mountain masses and extensive plateaus, which are often accompanied by extensive adjoining lowlands. In crossing Hokkaido, the two separated mountain ranges of Sakhalin give rise to the Kitami and Hidaka mountain lands in the eastern part of the island and to the Teshio and Yubari Mountains in the western part. Between them are extensive lowlands. The southwestward extension of the Kuril arc into Hokkaido is expressed in several separated volcanic groups, which reach their highest elevation in Taitsetsu-zan (Asahi-dake) at 7,513 feet in central Hokkaido. Japan's second largest lowland, the Tokachi plain, in the western part of Hokkaido, lies just south of and adjacent to the juncture of the Kuril and Sakhalin arcs.

The Tohoku mountain system comprises the southwestern peninsula of Hokkaido and extends southward to the central part of Honshu. Here both the three mountain chains and the bordering and intervening lowlands run quite exactly parallel to the axis of the Tohoku arc. This is especially pronounced in the central and western portion of northern Honshu. The central range is the highest and forms the backbone of the area. It is surmounted by many towering volcanoes. The Dewa range in the west is much lower and in parts is hardly more than hill country. Between these two ranges is the Median Groove, an intermittent chain of down-faulted basins whose floors afford fertile plains. These three terrain elements—the two mountain ranges and the intervening lowlands—extend northward to form the southwestern peninsula of Hokkaido. The island of Hokkaido, then, is divided into two quite distinct parts in terms of terrain features. Separating these two sharply contrasting divisions is the wide and uninterrupted Ishikari-Yufutsu lowland, which runs north and south between the two bays whose names are combined to identify the plain. A genetic continuation of this lowland extends

southward between the central and eastern ranges of Tohoku. In the far north of Honshu it accounts for the elevated Sambongi-hara or Mutsu plain. Just southward and terminating with the Gulf of Sendai is the Kitakami lowland, which southward from the Gulf of Sendai continues as the Abukuma lowland, including the Fukushima and Koriyama basins. The southernmost extension of this intermontane line of lowlands accounts for the great Kanto plain and the depression occupied by Tokyo Bay. The eastern of the three ranges of Tohoku borders the Pacific shore. It is broken in two by the Gulf of Sendai. The northern half is known as the Kitakami, and the southern is called the Abukuma. Peneplain remnants characterize both of the mountain lands, and both lie somewhat oblique to the general trend of the major arc.

The Shichito-Mariana arc is of tremendous topographic importance to Japan. It is associated with the mighty transverse tectonic depression of the Fossa Magna, which cuts north and south through the center of the main island of Honshu; with the famous and beautiful Fuji-Hakone-Amagi volcanic mountains; and with the high intermontane basins of central Honshu, including Matsumoto, Suwa, Kofu, Zenkoji, and Saku. The high, bordering mountain lands of Akaishi, Kiso, and Hida, though belonging to the Seinan system, seem to have been effected by the same orogenic forces and so trend in the same direction as the Shichito-Mariana arc. As the Shichito-Mariana arc approaches Japan from the Pacific, it gives rise to the spectacular Seven Isles of Izu (Izu Shichito), which are volcanic islands resting upon a submarine range. It then continues northward to form the massive and jumbled volcanic Izu Peninsula, with its famed hot springs and coastal resorts. This volcanic land continues northward and includes the great dissected volcano of Hakone, with beautiful Lake Ashi lying within its large crater. Nearby towers Japan's highest and most beloved mountain, Fuji-san, or Fujiyama, a majestic and nearly perfect conical volcanic cone, rising from sea level to 12,395 feet.

The Fuji volcanic chain continues northward through the Fossa Magna, and the western margin of this great transversal depression is marked by a tremendous and spectacular fault scarp. The eastern margin is also scarp bound, but is much less impressive. Between these scarps and the included volcanic lands of the Fuji chain occur the intermontane basins mentioned above.

The Seinan, or southwest, arc trends nearly due east and west and is divided into three parallel topographic zones. The northernmost lies within the inner zone of Japan and includes from west to east: the Chugoku range, which forms the backbone of the Chugoku Peninsula; the Tamba Plateau, lying just west of Lake Biwa; and the high nonvolcanic lands of Kiso and Hida. Elevations in this zone increase from west to east. Except for the two volcanic peaks of Daisen (5,620 feet) and Hyo-no-sen (4,954 feet) and the monadnock, Kanmuri (Kamori) -yama (4,393 feet), the highest peaks of the Chugoku range barely exceed 3,900 feet, while Hotakadake, at the eastern end of the zone and towering above the Fossa Magna, reaches a height of 10,138 feet.

The southernmost portion of the Seinan system bears the general name of the Kuma-kii mountain land. It belongs to the outer zone of Japan and is broken into four segments by three

water channels—Bungo Strait, Kii Channel, and Ise Bay. The four mountain sections thus separated are uniformly characterized by very rugged terrain features, with sharp ridges and deep V-shaped valleys. From east to west these four areas are known as the Kyushu, Shikoku, Kii, and Akaishi mountain lands. General elevations also increase from west to east, terminating in the Akaishi, the highest nonvolcanic mountains in Japan, where Mount Kita reaches 10,456 feet.

The third and middle portion of the Seinan system is the great depression occupied by the Setonaikai, or Inland Sea. This beautiful body of water presents two contrasting seascapes—the Seto and Nada. The former are stretches of island-studded water and the latter are spacious areas of open sea. The major island groupings from east to west are those of Awaji, Bisan, Geiyo, and Hoyo, which separate the open seas: Izumi-nada, Osaka-wan, Harima-nada, Bingo-nada, Hiuchi-nada, Aki-nada, Iyo-nada, and Suwonada. The great depression which holds the Inland Sea is continued genetically northeastward to account for the down-faulted basins and block mountains of Kinai. The more important of these rich and anciently settled basins of Kinai are the Yamato (Nara), the Yamashiro (Kyoto), the Omi (Biwa), and the Osaka (Settsu). A western extension of the Inland Sea depression also accounts for the down-faulted basins and block mountains of northern Kyushu. These basin plains, like those of Kinai, are rich, long settled, and densely populated. The Chikugo and Chikuzen plains are among these. The southern portion of the depression in Kyushu is largely buried by volcanoes. Here are the famous hot springs of Beppu, the summer resort of Mount Unzen, and the gigantic caldera of Aso, whose floor supports a dense agricultural population as well as a central cluster of new volcanoes, one or more of which are almost constantly active. Still farther west the depression continues to give again the characteristic scenery of the Inland Sea in the Amakusa Islands and Yatsushiro Bay.

The influence of the Ryukyu arc is most marked in the extensive volcanic region of southern Kyushu and in the smaller islands of Japan just south of it. It is probable too that the southward trend of the central Kyushu mountain land results from the orogenic forces of Ryukyu. In the Japanese islands just south of Kyushu three zones are found. Tanegashima, in the east, is a low, flat island of young Tertiary rock. Yakushima, in the center, is a spectacularly mountainous island of much older rock. On this small, circular-shaped island, which is but 16 miles in diameter, the highest peak of Kyushu, Yae-san, reaches 6,348 feet above the sea. The third, or western, zone is composed of a series of volcanic islands which belong to the Tokara volcanic chain and which are genetically continuous with the volcanic lands of southern Kyushu.

Lakes.—Though not particularly numerous and generally not of large size, Japan's lakes fall into three main types. Lake Biwa (Biwa-ko), which is the country's largest lake (278.37 square miles), occupies the western half of the tectonic depression known as the Omi Basin. Of this same type is Suwa-ko, occupying a tectonic basin of the same name. A second type is the lake of volcanic origin. The great majority of these are caldera lakes. These are quite numerous in northeastern Japan and in Hokkaido. Ashi-no-ko in the Hakone caldera is the most famous lake of

this type. Other well-known examples are Tazawa-ko in northern Honshu and Toya-ko, Shikotsu-ko, Akan-ko, and Kutcharo-ko in Hokkaido. Chuzenji-ko, in Nikko and well known to tourists, is also a caldera lake, but has been modified by later down faulting. A third type results from the blocking off of former estuaries by sand bars. Important examples of these are Hamana-ko in the middle Tokai region, Ogarama and Hachiro-gata in Tohoku, and Saromako and Abashiri-ko behind the Sea of Okhotsk shore of Hokkaido.

In addition to these three main types, a number of small lakes have resulted from the damming of valleys by volcanic action or other cause, and there are also a sizable number of crater lakes. The five famous lakes lying just north of Mount Fuji are the result of volcanic damming. Unagi-ike and Kagami-ike (Mirror Lake) in the far south of Kyushu are the best known of the crater lakes. The almost complete absence of glacial lakes reflects the fact that even the high mountains of Japan were scarcely affected during the glacial period—a marked disadvantage in the development of hydroelectricity.

Rivers.—The extremely mountainous character of Japan, the abundant precipitation, and the fact that no drainage divide is far from the sea have resulted in many short, small, and torrential rivers. Only 10 of Japan's rivers have lengths of as much as 125 miles. They are all subject to sudden and violent flood, and flood damage over the years is much heavier than that caused by volcanic action and earthquakes. They are everywhere shallow and, except as they flow over the limited areas of plain, have extremely steep gradients. They are therefore of very limited value for transport, except for the floating of logs in the high-water period. Short and narrow valleys, allowing but limited storage capacity, combined with sudden and sharp alterations in the regimen of river flow, seriously handicap the development of hydroelectric power. The narrow mountain valleys permit only slight development of flood plains, and these are usually subject to inundation. Most such valleys have multiple river terraces, which afford safer sites for settlement and trajectories for communication routes than the present flood plains. As these swift and torrential streams leave the mountains and pass over the littoral plains or through intermontane basins, their flow is rapidly checked and heavy deposition takes place. Nearest the base of the mountains they deposit their coarsest materials and build steeply inclined alluvial fans. Farther on, the depositional materials tend to become finer, and the stream channels markedly broader. The characteristic streambed on the larger plains is very broad and in the dry season carries a braided stream. Deposition continues to be heavy, and with a strong seasonal differentiation of flow the river channels tend to build higher than the surrounding plain. In extreme cases roads and even railroads follow tunnels under the riverbeds. These elevated rivers make irrigation easy, but greatly increase flood damage if the levees give way in times of high water.

Japan's greatest debt to its rivers lies in the fact that virtually all its plains have surfaces of river deposition. This has given Japan its best agricultural land and the great bulk of all its rice land. The same rivers have remained to supply water for irrigation. There is a close correlation between the size of the river and the size

of the alluvial plain with which it is associated. The Tone-gawa, Japan's second largest river, accounts for most of the alluvial surface of the Kanto plain. The Shinanogawa, Japan's longest river, has built and waters the great alluvial plain of Echigo on the Sea of Japan. The three large rivers—the Kiso, the Nagara, and the Ibi—have built the largest continuous area of alluvium, the Nobi or Nagoya plain. The Yodo-gawa crosses the Osaka plain, the Kitakami-gawa built the Sendai plain, and the Chikugo-gawa waters the Tsukushi plain in northwest Kyushu. The Tokachi and Ishikari rivers are associated with Hokkaido's two largest plains, which bear the same names.

Shorelines.—Japan has an exceptionally long shoreline. The roughly 17,000 miles of coast gives to Japan one linear mile of shoreline to each 8.4 square miles of area. This shoreline is not only highly irregular, but also is exceedingly rich in variety and complex in origin. Many types of coastline can be encountered within relatively short distances, and much of Japan's justly famous scenery is found along its coast. If, for example, one follows the Tokaido Railway southwestward from Tokyo for the 77 miles to Numazu, one finds a rich variety of shorelines. First, there is the flattish, muddy deltaic shore of Tokyo Bay. This has been largely reclaimed and is used as sites for industrial plants. Then, along the eastern part of the head of Sagami Bay, extensive stretches of smooth sandy beach are encountered, but the western part is very rocky with narrow coastal terraces inland. Next, narrow sand dunes stretch along the shore of the Sakawa plain. Just southwestward is the Izu Peninsula, where deeply eroded volcanoes reach the sea. As Numazu is approached, a deeply indented coast, formed by the drowning of the margin of a maturely dissected mountain land, occurs. This short stretch of coast from Tokyo to Numazu is not exceptional in its variety, although the Pacific shore is more rugged and varied than that of the Sea of Japan.

In general, the shorelines of Japan fall into two types, sandy and rocky, each of which can be divided into several subtypes. The sandy shoreline occurs where plains, large and small, reach the sea. These characteristically consist of a smooth and sandy beach with a beach ridge in the rear. The shoreline of some sheltered deltaic plains, where wave action is at a minimum, are backed by extensive shore flats. The head of Tokyo Bay, at the mouths of the Sumida and Edo (Yedo) rivers, and the head of Ariake Bay, where the Chikugo River debouches, are of this subtype. The rocky shoreline is found where mountain slopes descend directly into the sea. Where submergence has taken place, the sea's invasion of the erosion valleys results in a highly indented coastline. The best examples of this subtype are found along the coast of the Kii Peninsula facing the Sea of Kumano and along the coast of the southeastern part of the Kitakami mountain land. Another rather common subtype is found where uplift has resulted in a series of coastal terraces backing the present sea cliff. These are commonly associated with the ends of rocky peninsulas, such as the southern parts of the Boso and Kii peninsulas. Much of the Hokkaido coast presents such shorelines, with Cape Erimo as the most spectacular. Cape Muroto in southeast Shikoku is another fine example, as is the Ajigasawa district on the Sea of Japan coast

of northernmost Honshu. The fault-line shore, displaying the present sea cliff without backing terraces, is well represented by the coast running northeastward from Tsuruga. Still another rocky subtype, of which western Kyushu is an example, occurs where uplifted and down-faulted blocks alternate. The former account for peninsulas and island groups, and the latter for bays and inlets. A modification of the rocky shoreline types is found where there is an active development of sand bars producing land-tied islands and bay-mouth bars. Shio-no-misaki at the end of Kii Peninsula is an example of the first, and Cape Miho at the head of Suruga Bay exemplifies the second.

2. POLITICAL DIVISIONS AND POPULATION.

For purposes of local administration, Japan is divided into 46 primary units, each having considerable autonomy. Most of these units are called *ken*, which is usually translated as prefecture, but there are three kinds of exceptions. The unit which contains the capital and metropolis is known in Japanese as *Tokyo-to*, usually translated as Tokyo Capital Prefecture. (For Tokyo's special status see section on *Government*.) The entire island of Hokkaido constitutes one unit known as *do* (Jap. *dō*). The large cities of Osaka and Kyoto are in units known as *fu*, which is usually translated as city prefecture. This system is referred to as *to-dō-fu-ken*, stated in the order of rank and importance. Table 1 lists the 46 primary political divisions of Japan, their area in square miles, their population as of the census of 1960, and their capital cities.

The system of *ken* or prefectures was adopted in 1871 to replace the system of feudal fiefs. At first Japan was divided into 302 *ken*, but in the same year amalgamation began and the number was reduced to 3 *fu* and 72 *ken*. This trend continued until by 1876 the total stood at 3 *fu* and 35 *ken*. The following years saw considerable readjustment, which resulted in the creation of some new *ken*. By 1888 the present (1963) number of divisions (46) and their boundaries were established, except for the western part of what is now Tokyo-to, which was not annexed until 1892. The aims of the *ken* system, in addition to facilitating local administration, were at least twofold. The first was to break down the spirit of sectionalism, which had developed under the feudal and earlier *kuni*, or provincial, system. The second was to create political divisions with approximately equal resources. The first aim was, on the whole, successfully achieved, although people still like to refer to themselves as residents of an old *kuni* or *daimiate*. The second aim was defeated by the rise of industry, which gave great advantage to some areas and little or none to others. The names of most *ken* were derived from that of their largest city, which became the *ken* capital, such as Kyoto, Osaka, Kagoshima, and Hiroshima. Some *ken*, on the other hand, took their names from that of their most important county, such as Miyagi, Hyogo, and Ishikawa. There were other exceptions as well; Kanagawa took its name from one of the 53 stages of the Tōkaidō (Eastern Sea Road).

Until 1948 the *ken* were administered by governors appointed by the central government in

Table 1—THE PREFECTURES OF JAPAN

¹ With the restoration of the Amami Islands in 1953, the area of Kagoshima was increased to 3,511 square miles, and that of Japan to 142,798 square miles.

Tokyo, but since that year the *ken* governors must stand for popular election.

The *ken* are divided into secondary political units of three types: (1) *shi*, or city; (2) *machi* (*chō*), or town; (3) *mura* (*son*), or (as generally translated) village. This system is known as *shi-chō-son*, stated in order of rank. These units consistently have had a considerable degree of autonomy. Until 1926 the *gun*, or county, was an intermediate division, but it functioned rather as a detached branch of the *ken* government than as an autonomous unit. Although the *gun* was officially abolished, some offices continued to function under the *gun* name, such as certain agricultural experiment stations. In fact, after considerable inconvenience had been experienced, an office known as the *chihō-jimusho* (local administrative office) was created to perform the functions of the *gun* office for one or more of the old *gun* areas. Both the *shi* and the *machi* involve sizable settlements which have urban functions, but they usually also include country areas of rural settlement. The *shi* is the more important urban settlement and by law must contain 30,000 or more people. It also has much more autonomy than the *machi*.

In the census of 1960 the combined population of all the *shi*, including that of Tokyo-to, was 59,333,171. This was 63.5 percent of that of the entire nation. Although many of the *shi* embrace extensive and well-populated rural areas

if this population were subtracted from the inclusive figures, it would make no important difference in the ratio given above. There are 42 *shi* with populations of over 200,000, and 7 with over one million. The latter are Tokyo, Osaka, Nagoya, Yokohama, Kyoto, Kobe, and Kitakyushu, stated in order of size. The population of Tokyo, which was 6,778,804 in 1940, probably approximated 8 million in the early part of World War II and decreased to probably 2,500,000 after the war, but rose to 4,556,000 by 1949. It was 8,310,027 in 1960. The eighth largest city is Fukuoka, with 647,000 people. Kitakyushu was formed in 1963 out of 5 smaller cities.

The more important of Japan's cities, with 1960 census populations, appear in Table 2.

The distribution of Japan's cities reflects the overall distribution of population as well as that of manufacturing and related industries. Where cities are numerous, the surrounding rural population is dense and, conversely, in regions of low rural densities cities are both scarce and small. Japan's phenomenal industrial growth has accrued primarily to a narrow east-west belt extending from Tokyo through the Tokai, Kinki, and Setouchi regions into northern Kyushu. Here Japan's seven largest cities and a considerable number of its smaller ones are found. It is into

Table 2—POPULATION OF PRINCIPAL JAPANESE CITIES

¹ 1963.

these cities that Japan's equally phenomenal population growth has been largely absorbed.

Population.—The problem of population and food supply in Japan has long been chronic. The nation's loss of empire and markets and its strong upsurge in population made the problem more than ever one of stark reality after World War II. During 1949 the increase in population was 1,773,476, the largest of any year in Japanese history. The number of births was 2,724,206, or 33.1 per 1,000; the number of deaths, 950,730, or 11.6 per 1,000. The birth rate, then, was that of the Orient and the death rate approached that of western Europe. Total population in 1960 was 93,418,501.

During the latter half of the Tokugawa period (1603–1867) the population of Japan seems to have remained stationary, probably at about 30,000,000. The estimated figures of the time ranged from 25,000,000 to 27,000,000, but admittedly omitted samurai and outcasts, who together probably totaled 3,000,000. In any event, the first comprehensive estimate, made in 1872 after the Meiji Restoration, indicated a population something in excess of 33,000,000. From that date there was a steady increase, supported by an improved agriculture and absorbed largely into agriculture, until the end of the Sino-Japanese War in 1895. The population in 1897 was estimated at 42,400,000. Especially noteworthy was the

growth of population in the semifrontier lands of Tohoku and southern Kyushu and on the actual frontier of Hokkaido. This was also a period of rapid land reclamation, and there was a healthy, but not spectacular, increase in urban population. After the Sino-Japanese War came the manufacturing industries and a greatly increased production. There was a steady increase in light industrial production until World War I. Particularly pronounced was the increase in urban population and in that of coal mining and sericultural districts. In the older, overcrowded agricultural districts the rural population actually showed some decline, but continued to increase where new opportunities were available. The 50,000,000 mark was exceeded in 1909, and the population reached 54,134,000 by 1917. Following World War I there was a period of industrial vicissitudes lasting for about a decade. Then began a new era of industrial activity, both light and heavy, and a most rapid increase in the size of cities. Rural populations everywhere showed a relative decline and in many areas an absolute loss. By 1927 a total of 61,317,000 was reached; in 1937 the population was 71,253,000, representing an average annual increase for the decade of approximately 1,000,000 people. The rate of increase then began to show a slight decline. The figure for 1940, just before Japan's entry into World War II, was 73,114,000. Between 1937 and 1945, Japan lost about 1,200,000 army and navy personnel, as well as nearly 250,000 civilians by bombing. The figure of 83,199,637 in 1950 represented a rapid increase. In part this was due to the return of Japanese from abroad, but still more to a rising birth rate. The rise after the war was certainly due in large part to the return of millions of young male Japanese to Japan. In 1950, however, the birth rate dropped to 28.2 and in 1951 to 25.6. In 1960 the birth rate dropped to 17.2, and the following year reached a record low of 16.9. It should be noted that the death rate also dropped, to 7.6 in 1960, and 7.4 in 1961.

3. THE PEOPLE. This section treats Japanese racial and cultural origins, the family, the life cycle, special groups, and cultural patterns.

Racial and Cultural Origins.—The people of contemporary Japan consist of the predominant Japanese and some 15,000 or so Ainu, a people of Caucasoid affiliations found chiefly in northern Japan. Modern Japanese, while basically of Mongoloid stock, are of mixed racial background. The basic Mongoloid traits include black hair and dark brown eyes, tan skin, the Mongoloid spot on infants, and a common occurrence of the epicanthic eye fold (slanting eyes). In addition, Japanese have relatively short legs, giving an average stature of 1.65 meters (five feet five inches) for men and somewhat less for women. They are distinctly roundheaded (cephalic index of 80 and over). The Ainu genetic strain, however, gives many Japanese more body and facial hair than is characteristic of the true Mongol, and another, southern, genetic strain frequently gives wavy hair. This waviness was once a source of misfortune to such Japanese women as were born with it, because the social ideal used to be straight black hair. For a similar reason the

occasional Japanese born with a brownish hair tinge may employ dye rinses to achieve an ideal black.

The origin of the Ainu and of the Japanese people themselves has been the object of considerable archaeological research and is also the subject of Japanese mythology. The full story of the Shintō myth of origin may be found in the *Kojiki*, written in 712 A.D. by imperial order, and in the *Nihon Shoki* (*Nihongi*), written in 720. The myth of origin told in these books retraces the ancestry of the Japanese people to a primeval divine pair, Izanami and Izanagi, who first inhabited the islands which they had formed out of drops of mud from Izanagi's honorable spear. As the original pair, Izanami and Izanagi were at first not certain how to go about getting married and having offspring. When this problem had been settled, numerous offspring were produced, the last being a deity of fire. In giving birth to this being, Izanami was fatally burned and she went to a nether world of death. Izanagi, distraught, sought to follow her, but she warned him not to look upon her in her unclean state of death. He did so nevertheless, and in shame and anger his late spouse sent the old woman of the underworld to chase him. As he fled, Izanagi cast behind him his headdress, which turned to grapes; these the old woman paused to eat. Next he discarded his comb, which turned into bamboo sprouts; these the old woman lingered to uproot and to eat. By such means Izanagi eventually succeeded in escaping. Then when he stopped at a stream to wash away the uncleanness of his contact with death, Amaterasu-ōmikami was born of his left eye. This deity, the Sun Goddess, became the divine ancestress of the Japanese imperial line. Her spirit is honored to this day at the great Shintō shrine at Ise in Mie Prefecture.

This tale of the origins of the Japanese is of interest not only for its importance in Japanese religion, but also because some of the content of the myth indicates affiliation with the east Asian mainland and with the Malayan culture of Formosa and of other Malayan peoples to the south. The account of the first conversations of Izanami and Izanagi and the problem of marriage, for example, is paralleled in the mythology of Formosa and of the islands farther south. The incident in which Izanagi flees from the old woman of the underworld is similar to "magic flight" stories of the Asian mainland and northwestern North America. The evidence of folklore thus indicates two outside cultural influences in early Japan: one from mainland Asia and another from the southern islands.

Archaeological evidence also indicates early cultural influences from more than one area. Prehistoric pit dwellings which have been excavated resemble those of historic tribes in northeast Asia. The contemporary rural dwellings of Japan have a strong architectural resemblance to Malaysian forms, being raised from the ground on piles and having a thatch roof and relatively open sides. These are quite different from the tile-roofed and earthbound dwellings of China. Early pottery types are of forms similar to Korean types. Some of the early jewelry, such as the claw-shaped *magatama*, is made of stones, such as nephrite, not found in Japan.

Not only are the early cultural forms of diverse origin, but the physical types of the Japanese also indicate mixed origins. No Paleolithic finds of man or his culture have been positively iden-

tified in Japan, but early Neolithic finds indicate that one of the most widespread early inhabitants of the islands was a kind of man similar to the Ainu. This type seems to have existed as far south as the Ryukyus. The notable hairiness of the face and body of men of the Ainu type has led many anthropologists to conclude that they are part of an early east Asiatic Caucasoid stock which was later overwhelmed by Mongoloid types. In Japan the latter seem to have come largely via Korea and to have spread gradually northward and southward from Kyushu and western Honshu. Today the Ainu type is found in scattered individuals on Okinawa and as a distinct ethnic group with much of its own culture in Hokkaido. Notable older traits of Ainu culture include a bear festival and sacrifice, tattooing of the lips of women, and garments bearing characteristic broad white line designs on a blue background.

Another early type in parts of Japan was probably of Malayan affiliation. The wavy hair and facial features of many Japanese have parallels among some of the peoples of the Philippines and Indonesia. Some cultural traits of Malayan origin found in traditional Japan included the blackening of teeth as a mark of beauty, the characteristic Japanese house, and the marriage ritual. It is probable that the Malayan traits of the Japanese and their culture and those of the southern regions were diffused from some common area in Southeast Asia rather than that these came to Japan from Indonesia.

In historic times the strongest outside cultural influence has been the Chinese. Certain governmental forms, Confucian philosophy, and Buddhism, as well as the arts of painting and sculpture associated with Buddhism, are notable influences.

While the Japanese are thus of mixed racial background and their cultural origins come from diverse mainland sources, they have developed, like the British, as an insular nation and have created their own characteristic culture. Nor is Japanese culture restricted to combinations of borrowed elements. Some distinctive Japanese cultural inventions include the deep hot bath and the whole complex of behavior surrounding it, the characteristic alternating 5-7-7 syllable, non-rhyming lines of the Japanese poetic form, and the delicate light paper used for multitudinous purposes long before the people of the West had heard of Kleenex. Japan has also contributed her share in religious development, Shinshū and Nichiren being distinctive Japanese sects of Buddhism, and the characteristic forms and deities of Shintō being peculiar to Japan. (See section on *Religion*.)

Family and Household.—The primary social unit of Japanese society is the household consisting of a family, an occasional other relative, and, if the family is well to do, one or more servants. The size of a community is usually calculated not in individuals but in households, and many local civic duties are reckoned in terms of days' work per household rather than per individual.

The basic kinship group in Japanese society, as in all societies, is the family. It differs, however, from the family in the United States in composition and in the social roles of its constituent members. Members of a Japanese family include the head of the house and his wife, the eldest son (by birth or adoption) and any of his children, and any unmarried children of the

master and his wife. The family thus can comprise two marriage units or elementary families. This kin group lives together in a single household. Sometimes there are also living as part of the family a grandfather and grandmother who have retired. This means that the old man has surrendered to his son the headship of the family and the responsibility for household affairs.

A larger kinship unit is also recognized in the form of the extended family, comprising not only the brothers and sisters of the male side of the immediate family, but also any of the master's children who may have married or have been adopted by others or have established branch families. This extended family comes together for weddings and funerals. They help one another in certain agricultural work, and the older members form a family council for reaching important decisions concerning the family welfare, such as buying or selling land or arranging a marriage. In family dwellings servants also form part of the household. The manservant or maidservant in the house usually comes from one of the less well-to-do families in rural areas and may even be a nephew or niece of the master or his wife. Servants are usually hired by the year and are treated as part of the family in work and at meals.

The social position of the master of the house is reflected in the fact that he takes the first bath, receives the first food, and is responsible for taking care of the income of the family. At the same time he is responsible for the family welfare. He represents the family in its dealings with the government and with other external institutions. While the head has ultimate financial responsibility, the wife generally manages the internal economy of the household, covering such matters as the purchase of food and of clothes for the family and for the servants. Japanese women by tradition also play an important part in family affairs. For example, the older women make most of the preliminary family arrangements leading to a marriage and conduct the necessary preparations for funeral and memorial services. Informal education of the children also in large part falls to the mother.

The custom of adoption is widespread in Japan. One of its important social functions is that of preserving the continuity of the family and of the family name when there is no heir. Japanese also have a great fondness for children, and a childless couple is likely to adopt a child quite apart from the consideration of the family name. There are a number of forms of adoption, including adopting a son if one has no children, adopting a husband for one's daughter if one has no son, and adopting a younger brother as a son. Adoptions, like marriages, must be recorded and also can be legally dissolved. In general, an adopted son has both the rights and the duties of a real son.

The Japanese place considerable emphasis on age status. This is reflected in the fact that in Japanese one refers to "older sister" or "younger sister," not just "sister" or "brother." Similarly, the oldest son has more privileges and also more responsibilities than a second or third son (it is usually second or third sons who are adopted by other families, whereas a first son is expected to continue the family line). A corollary of this emphasis on relative age is the closeness of coeval neighbors or classmates.

Life Cycle.—In the course of the lifetime of

a Japanese, a number of important events mark changes in his social status in his family and community. These include the rites of passage related to birth, marriage, and death common to so many societies.

Birth.—In most of Japan midwives rather than physicians assist the mother. A few days after the birth there is a naming ceremony, to which are invited the midwife and a few relatives and close friends, all of whom bring gifts for the new baby. Special birth ceremony cakes are served at this time. The details of the naming ceremony vary from region to region, but the essential gathering which serves to introduce the newborn child to the immediate family and to the neighborhood group is universal. Since the child is small and may die before reaching adulthood, he has as yet little social personality, a fact which is reflected in the smallness of the gathering at a naming ceremony.

Hiaki.—At 31 days after birth if a boy or 33 if a girl, *hiaki* is observed. The child is taken to visit the deities at the village Shintō shrine, where a brief ritual is performed by the priest. This serves to introduce the child to the village gods and marks the end of an initial stage in the child's life. At this time the mother is also relieved of a number of restrictions concerning food and now may cross water and may resume ordinary house or farm work. *Hiaki* marks the end of a period of anxiety and uncertainty as to the survival of the child.

Early Training.—A Japanese child is usually nursed until another is born. It is taught early to value cleanliness. The young child, especially if a boy, is a favored person and is rarely subjected to physical punishment. With the birth of the next child, the erstwhile youngest loses the center of attention and is put in care of a less attentive brother or sister or nurse. He soon adjusts to his new position and joins the young age group of two and three year olds of his neighborhood.

Children learn both the physical and the social differentiation between boys and girls early in life. In general, in teaching the young child proper behavior the sanctions of praise and ridicule are strongest and resort to physical punishment is not ordinarily made.

The earliest and closest ties of a child are with his mother, who feeds and bathes him and sleeps next to him at night. Thus is formed between child and mother a strong sentimental bond which may persist through life despite the many traditional restrictions placed upon it in Japanese society. Even an adult man may heed an old mother's advice.

Marriage.—Traditionally marriages in Japan are matters of arrangement between two families of similar social class. The first step is for a "chance" meeting to be arranged between the two principals. After such a meeting their feelings are sounded and, if there are no serious objections, further negotiations may be undertaken. One aim of such an early casual meeting is that, in the event that either side objects to the proceedings, the engagement may be canceled before it becomes public knowledge and neither family need lose face.

After these preliminaries a family friend, who is chosen partly for his social standing, will be invited to act as go-between. Since marriage arrangements involve investigations of delicate matters in family history, such as leprosy, tuber-

culosis, and police records, it is easy to see the need for an intermediary in order to avoid direct face-to-face embarrassment between the families concerned.

If all goes well, the next step may be a formal betrothal exchange (*yuinō*) between the two families, but this is not typical of the average farm family. When the marriage date has been set, partly on the basis of astrology and partly on general convenience (it usually takes place in the fall), the groom's family prepares the house to receive the bride, installing new screens, refurbishing the kitchen, and the like, while the family of the bride prepares the wedding clothes and purchases such wedding gifts as a chest of drawers.

On the day of the wedding the bride, accompanied by her relatives, goes to the groom's home, where the ceremony of *sansan-kudo* is held. This is a formal exchange of sake (rice wine) between the immediate relatives, the marriage broker and his wife, and the bride and groom. Then the wedding banquet takes place, after the bride's relatives, seated on one side of the room, have been introduced to the groom's relatives, seated on the other. On the second day there is another banquet given by the groom's family to introduce the bride to the important people of the community, such as the mayor or the village headman and the schoolmaster; and on the third day there is a lesser, but nonetheless gay, party to introduce the bride to the women of her neighborhood. A wedding is usually a high point in the life of a household and may involve considerable expense.

The marriage often is not formally registered until some time after the social event. If the marriage should prove unsuccessful during this intermediate period and the principals separate, there is thus no record whatsoever that a marriage has taken place. In general, if a child is expected, the marriage will be registered to ensure its legitimacy. The birth of a child tends to consolidate a marriage and improve the social position of the wife in her new family.

A few days after the ceremony the bride and groom make a ceremonial visit, bearing gifts, to the go-between. He continues his responsibilities for the marriage and may be consulted in the event of marital disagreements and invited to any important events in the family, such as naming ceremonies and funerals.

Since World War II there has been some increase in the number of marriages which result from free choice on the part of the individuals concerned, but even under these conditions a go-between is often used for form's sake and to arrange the actual marriage ceremony.

Retirement.—When a person reaches the age of 60, he is likely to retire, surrendering the responsibilities of family and household to his eldest son. There is sometimes a small party of a few relatives and friends to celebrate a man's attaining this age. In a sense he has achieved a second childhood and again may wear red underclothes and may speak freely without being called to account. In rural Japanese society it is the young ladies who are prim and proper and the old women who may do and say what they please.

Death.—The final event of the life cycle is death. The neighbors come together to console the bereaved and to assist in funeral preparations, while the relatives meet to mourn. The funeral itself, however, does not mark the end of a man's social life, inasmuch as it is followed by a series

of memorial services, which begin the day after death. In Japan the death day of a famous man is as likely to be celebrated as his birthday and he is also likely to be known by a posthumous name, as are the Emperor Jimmu and the great Buddhist leader and scholar Kōbō Daishi.

There are seven memorial services marking the first seven weeks following death. The last of the seven (on the 49th day) is *hiaki* and represents the end of the heavy mourning period, after which a number of mourning taboos may be lifted. (This is similar to *hiaki* following birth.) There are then yearly memorial services at traditional intervals for 100 years. Most ordinary families rarely observe these memorial services beyond the 50th year, and for women and children the last memorial service may fall considerably short of this interval. Traditionally, Japanese funeral and memorial services are performed by Buddhist priests.

It may be noted that in all the celebrations associated with birth, marriage, and death there is an intermediary present—the midwife, the go-between, the priest—and that he sits in the place of honor at the banquet. It also may be noted that there is a banquet for kin associated with these events and that the size of the social gathering varies in accordance with the social importance of the event or of the person for whom the ceremony is held.

Special Groups.—In Japan there are several special categories or groups of people whose status, until comparatively recent years, was defined by law and who, even today, continue to occupy a special position by force of custom and public opinion.

Eta.—In pre-Meiji Japan, the eta, or pariah class, ranked below the social classes of warrior, farmer, artisan, and merchant. The eta performed tasks considered menial and unclean, such as those of slaughterers, tanners, and executioners. Although these distinctions were legally abolished during the Meiji period (1868-1912), the traditional prejudices against the million or more people descended from this class persist to this day. The term eta is not a polite one and today the term *suiheisha* (water level, that is, equal) is preferred. Other Japanese ordinarily will not intermarry with *suiheisha*, and they frown upon the rise of people of this origin in the social or political hierarchy. Their economic position has not changed greatly, and many remain as tanners, shoemakers, butchers, tenant farmers, peddlers, and day laborers. The people organized themselves into the Suiheisha Undō (Water-Level, or Equalization, Movement) for their social betterment in the 1920's and succeeded in forcing greater recognition of their civil rights. The organization aroused such hostile public sentiment by its militant and terrorist tactics that during the crisis of World War II the movement was largely suppressed.

Geisha.—The geisha are entertainment girls, who dance, serve drinks, and provide light company at a banquet in the tradition of the court ladies of old Japan. The geisha undergoes an apprenticeship and is licensed by the police. Strictly speaking, she is not a prostitute (*jorō*). The geisha's entertainment is by no means innocent, however, and her jokes often carry double meanings. The geisha provides glamorous sex appeal, which middle- and upper-class Japanese men do not expect from their wives. Since World War II the careful training of the geisha in the

art of song and dance has declined and some of her traditional functions have been assumed by cabaret girls and others.

Women.—Traditionally the Japanese woman was supposed to be the loving and respectful servant first of her father, then of her husband, and finally of her son. Until the Allied occupation of Japan the principle of the inequality of the sexes was also embodied in the civil code, in such matters as property, inheritance, and divorce. The culture demanded that the woman be dutiful, patient, and good natured. The career woman was rare.

In actual fact, however, the Japanese woman did not occupy so inferior a position as was generally believed. A distinction must be drawn between women in the upper and middle classes and women of the farming and poorer classes. Among the latter, numerically more significant than the former, the woman was in many ways the social equal of the man, partly due to the greater economic interdependence of the sexes and partly due to the fact that the Confucian traditions of woman's inferior status were less firmly entrenched among them. Lower-class women are much freer in speech and gesture than their middle- or upper-class sisters. Even the higher-class woman had certain advantages of social and psychological security. She could be reasonably sure that her husband's affair with a geisha would not interfere with his family obligations and thus break up the home. In the event of widowhood her husband's family would look after her.

Since the Allied occupation a number of legal changes, giving women the vote and greater rights in initiating a divorce, have been made. It is doubtful, however, if the actual social changes are as great as the legal changes indicate, partly because women in Japan have never been so unimportant in the family as many foreigners have thought and partly because social changes are rarely so dramatic as legal changes.

Cultural Patterns.—A cultural pattern is a traditional mode of behavior characteristic of the members of a particular society. Every society is characterized by its own peculiar texture of such patterns of behavior on the part of its constituent members. In Japan, for instance, when greeting one another people bow, whereas in the United States they shake hands. This reflects a general Oriental pattern of culture whereby bodily contact between the sexes in public is bad form. In this subsection six predominant cultural patterns of Japanese society are outlined:

(1) The pattern of group action and group responsibility rather than individual action and individual responsibility.

(2) The pattern of avoidance of face-to-face relations of embarrassment.

(3) The pattern of loyalty and group solidarity.

(4) The pattern of self-discipline and the attainment of success against great odds.

(5) The pattern of ritual cleanliness.

(6) The pattern of ceremonial suicide.

Group Action and Group Responsibility.—Throughout Japanese society from the central government to village communities stress is laid on the group rather than on the individual.

Although the Japanese Cabinet, including the prime minister, reaches its decisions as a result of discussion and compromise, the final decision is published as unanimous. No vote is taken on an

issue, and no majority and minority reports are made. It is considered more important to achieve a unanimous decision by compromise; if this cannot be done, dissenting members may resign.

In rural areas the village councils, when discussing policy with the village headman, come to a group decision in the same manner. A headman or mayor would never think of pursuing any policy without the agreement of his council.

Associated with group responsibility is a pattern of rotating responsibility. In village affairs the hamlet head changes annually, and a local god house (*dō*) is tended by a different group of neighbors (*kumi*) each year. In the national government no one man is prominent as the responsible leader for a long time—different leaders appear as prime minister, but none becomes a permanent officeholder.

Avoidance of Face-to-Face Relations of Embarrassment.—This involves the concept of face—personal self-respect and prestige—so important in the Orient. To disagree point-blank with a person over a cup of tea would be rude in the highest degree—hence the tendency for polite agreement with most comments even though they be inconsistent one with another. On more important matters, such as marriage or a business deal, where some disagreement is inevitable, embarrassing face-to-face relations are avoided by means of a third party or go-between.

A marriage, which is primarily a social and economic relationship between two families, involves, as already shown, much careful investigation of familial backgrounds, and such investigations, if made directly, easily could lead to embarrassment and loss of face by one or another of the families concerned. This is avoided by a go-between, who serves to maintain relations between the families during the critical period.

Since in business dealings direct bargaining would be unseemly, Japanese prefer to employ the services of a broker or business go-between, who may receive a commission from both parties for his services—from the one for getting a high price, from the other for reducing the price.

In the employment of servants it is usually best to work through an intermediary in Japan. And a servant is likely to resign on a moment's notice if his employer causes him to lose face by openly accusing him of some error before other persons. For a servant to tell his master that he is resigning because he does not like the work or because he has an offer of a better job elsewhere, would be to cause loss of face to his employer. So he may give illness as the cause of his no longer working. The wise employer will understand and either will search for another servant or will offer to raise the wages.

Group Solidarity and Loyalty.—The Japanese emphasis on group solidarity involves the duty of loyalty to one's group, so that the individual will traditionally defend the interests of his employer, of his family, and of any other group of which he is an active member. The Japanese government and army of prior days, for example, stressed loyalty to the nation through personal loyalty to the emperor as the supreme duty of all Japanese citizens. The most famous of Japanese historical dramas, *The Forty-seven Rōnin*, is a tale of great personal loyalty to the memory of a feudal lord.

A corollary to these two traditional behavior patterns in Japanese society—group responsibility and face saving—is that an individualist is re-

garded as selfish and antisocial. The democracy of the United States was regarded before World War II by many Japanese as a society full of stress and strain because of its many members who—to the Japanese way of thinking—regarded their own individual welfare to be more important than that of their family or of their country.

These concepts of loyalty, group action, and avoidance of face-to-face embarrassment have developed in Japan as a result of two factors: (1) a long national history, especially the 250-year period of feudalism and peace which ended in the 19th century; and (2) the influence of Confucian ethics on Japanese thought.

The concept of rugged individualism found in the United States comes from the frontier and pioneer tradition of a newly settled nation. Japan, by way of contrast, has a long cultural history during which traditional patterns of social relations became stabilized. In such a society an individualist or a man who acts in an unexpected manner is criticized as upsetting social equilibrium.

Self-Discipline and Attainment of Success Against Great Odds.—Every year on May 5 there is a special festival in Japan to honor boys, at which time large paper carps are flown from poles. The carp, a fish which swims upstream and which does not wriggle when laid on the chopping block, is the traditional ideal of Japanese manhood.

In this ideal the societies of Japan and the United States come somewhat closer than in the first three national traditions. The Japanese schoolboy, for instance, is taught the story of how Abraham Lincoln rose to greatness from humble beginnings and how he walked for miles to borrow a book. Many Japanese heroes are men who rose to greatness by hard work and from humble beginnings.

Associated with the ideal of achieving great ends by overcoming handicaps is the Japanese ideal of frugality and self-discipline. This is perhaps a reflection of the frugality of Japanese daily life in homes with little in the way of material comforts. Zen Buddhism, popular in Japan, stresses mental discipline. In the Japanese Army, which was Spartan in all its phases, the conscript was soon taught the virtues of an even greater self-discipline and frugality than he had experienced in his civilian life.

Ritual Cleanliness.—When arriving at a Japanese inn or home, the guest must remove his shoes before entering and soon after arrival is expected to bathe. Almost everyone in Japan—even a poor worker or a rural peasant—takes a daily bath. The deep Japanese bath, incidentally, is a purely Japanese development different from anything in the rest of Asia or the West.

A small infant soon learns to respect cleanliness and to avoid dirt, so that all a mother need say to her child to make him drop something is that it is dirty.

The ritual aspect of this Japanese emphasis on cleanliness is seen in the sharp contrast between custom in regard to a Japanese house or temple and that in regard to Western-style buildings in Japan. In a Japanese home or inn or temple, where one removes footgear, the interiors are spotless; but in a train or a railway station, where one does not remove one's footgear, the floor may be littered with trash.

The whole basis of Shintō ritual is one of cleansing one's self—body and soul. Before enter-

ing a Shintō shrine one must wash one's hands and rinse one's mouth. Before the priestly ceremony begins, each participant presents a sacred branch at the altar as a symbol of a pure and sincere soul.

Ceremonial Suicide.—In Japan there is no religious sanction against suicide, which is not considered a sign of moral weakness or degradation. On the contrary, there are circumstances under which the courage to take one's own life is essential to the honor of the family name. In feudal times a sentence of self-destruction (*seppuku*, or harakiri) was considered more honorable than that of death at the hands of an executioner. Wives of samurai (gentry or lesser nobility of military vocation in the former feudal system) had as part of their dress a short dagger with which they could commit suicide in the event of a threat of personal dishonor. As is well known, Japanese soldiers were told that the only honorable course in the face of defeat and capture was suicide.

A man who regards himself as responsible for some tragic error may commit suicide. There have been cases of police officials who have committed suicide as the result of a relatively minor confusion in regard to arrangements for the emperor's progress through the area of their jurisdiction.

Another motive for suicide is that of protest. A man who feels some act to be very wrong, but who sees no way of changing it, may commit suicide at the doorstep of the man whom he holds responsible, that he may draw attention to the wrong. Such a suicide occurred before the American Embassy in Tokyo when the Immigration Act of 1924, which excluded Japanese, was passed by the United States Congress. This type of suicide is intended to embarrass the person against whom the protest is made.

Still another form of suicide is the rather mystical one involving a desire to follow in death some beloved leader. The most famous modern example of this was when General Maresuke Nogi and his wife took their lives after the death of Emperor Meiji in 1912.

In all these types of suicide it is clear that the individual must have considerable will power and be in a state of high rather than low morale. These are not the acts of men at the end of a downward moral course. In peacetime, however, none of these forms of suicide is common. Most suicides in Japan are prosaic self-dispatching as the result of poverty or of some social or moral impasse, such as the joint suicide of a young couple whose parents will not countenance their marriage. The suicide rate for Japan in the 1930's was just a little above that of the United States and below that of France.

In the physical or material culture of the Japanese there are also a number of characteristic patterns. For example, in the domestic architecture the low, horizontal line is stressed, giving to the interior of a Japanese-style house or inn a restful, aesthetic effect. Smallness of art objects is another characteristic trait. Japanese craftsmen have elaborated on small and carefully worked objects such as the netsuke. These matters are discussed in more detail in the sections on *The Fine Arts and Architecture*.

4. NATURAL RESOURCES. In this section are discussed the following resources: food, forest, mineral, fiber, fuel and power. That each of these overlaps with the others illustrates the complexity of the use of natural resources in all save the most primitive societies.

Japan proper—the islands of Honshu, Hokkaido, Kyushu, and Shikoku, together with nearby islands and the Ryukyus north of latitude of 27° N.—covers an area of 142,798 square miles. The estimated population of the country on Dec. 1, 1953 was 87,200,000. The pre-World War II area and population of Japan were much greater, since Formosa (Taiwan), the Kwantung Leased Territory, Korea, Karafuto (southern Sakhalin Island), the Kuril Islands, Okinawa, and the former mandated islands of the Western Pacific were then included. Although the empire, including Manchuria as well as the above-named territories, was far from being self-sufficient, it was relatively so at least in terms of food, and many strategic raw materials also were supplied in large quantities.

Japan is poorly endowed with natural resources from any standpoint, but it is unwise to attempt an analysis of her resource position without taking into account the markedly lower Japanese living standards as compared with United States standards. The following evaluation of resources is geared to Japanese standards.

Food Resources.—The qualities of the land and of the seas immediately adjacent to the land determine in large part the nature and quantity of food domestically available to any country. Topographically, Japan is a land of steep slopes and mountains with relatively small lowlands interrupting the dominant mountain structures. Furthermore, considerable areas of lowland are not cultivable for reasons of poor drainage or competing land uses. Thus, of the 91.4 million acres of land surface in Japan, only some 16 per cent is arable. Most of this land is in the lowland areas, of which the largest is the Kanto plain on the middle east coast of Honshu (3.2 million acres). Other major lowlands are the Ishikari plain in Hokkaido (.5 million acres), the Echigo in northwestern Honshu (.45 million acres), the Nobi on Honshu near Nagoya (.45 million acres), the Sendai along the northeastern Honshu coast (.37 million acres), the Settsu near Osaka (.31 million acres), and the Tsukushi in northern Kyushu (.30 million acres). All these lowlands are along the coast, and each contains a major urban center or centers. In addition, there are numerous smaller mountain basins on each of the major islands.

Climatically, Japan is better favored. No portion of the country can be said to be deficient in rainfall, although seasonal droughts occur, especially in the Inland Sea area, which with 40 inches of rainfall is the driest region. Japan's position on the eastern margin of Asia places it well within the monsoon realm, and the summer monsoon, the season of maximum rainfall, coincides with the growing season. At the same time, some areas (especially on the Japan Sea coast) suffer from excessive winter rainfall, and floods are not uncommon. In terms of climate in general and

temperature in particular, Japan proper, stretching from 27° to 45° 50' north latitude, resembles the southern and eastern coasts of the United States. Temperatures permit two crops a year in much of the country south of 37°, and the arable land surface can be increased substantially by this means. Indeed, 30 per cent of the cultivated land in Japan is double cropped. In Hokkaido, however, the climate resembles that of New England; severe winters and a relatively short growing season prohibit double cropping.

Japanese soils may be divided into two types: the irrigated and the dry. By and large, the irrigated soils are alluvial in origin, and alluvium accounts for about 15 per cent of Japan's surface area. Yet, not all alluvial soils are capable of agricultural use for reasons of drainage, slope (on terrace margins), or alternative uses chiefly in connection with urban occupancy. The irrigated soils are compact, uniform, and deep, but centuries of intensive use and monocultural practices have reduced their fertility to a point where constant fertilizing is necessary. Excess water percolating below the surface and constant puddling have led to a leaching of the upper horizon (essentially only one rather than several horizons as in nonirrigated soils) and to the formation of an impervious hardpan below the surface which further impedes drainage on level land. The dry soils are chiefly mountain and hill soils, thin and relatively infertile, though formed from a variety of parent materials. In the far north are found true podzols or forest soils; farther south these tend to become gray and brown podzolics; and in the south red and yellow podzolics with lateritic qualities predominant. Also common are the so-called *ando* soils, found only in Japan, which generally have developed over acid volcanic materials and are infertile. Some of the dry soils, however, are in the lowlands on terraces or gentle slopes. These are alluvial in origin and generally quite fertile, having been improved somewhat, as compared with most Japanese soils, over their natural state.

Associated with soils is the problem of drainage. The generally abundant rainfall characteristic of Japan is conducive to rapid soil erosion on cultivated or cleared slopes. Irrigated land, though little disturbed by erosion, is subject to frequent flash floods and to almost universal poor drainage. It is estimated that 40 per cent of the land under irrigation cannot grow a second crop, even when climatically feasible, because of inadequate drainage. Along the coasts land reclaimed from the sea and former lagoons is subject to flooding during storms and periods of strong on-shore winds.

In the light of this complex of natural conditions, it is not strange that Japanese agriculture, the basis of livelihood for almost half of the population, is compressed into valleys and lowlands, where high production is maintained by an unparalleled expenditure of human effort and by the liberal application of fertilizers. Where level land has not been available, there has been either an upsurge along the slopes of valleys and lowlands and the laborious creation of artificial terraces, or the clearance of forest slopes where soils are thin and easily eroded. Farm units are small, averaging 2.5 acres in 1954, but two thirds are even smaller. Holdings are scattered, and plots are separated from each other by ridges which serve both as property boundaries and as dikes to hold the irrigation water.

Agricultural patterns and production vary with climatic, topographic, and edaphic conditions. The characteristic pattern, however, is one of paddy cultivation on flats and level terraces, with other grains, tubers, and vegetables on the higher ground where water for irrigation is not available. Rice is grown throughout Japan, but in lesser quantities in Hokkaido and northern Honshu, where the growing season is short. In these areas wheat, oats, millet, buckwheat, and corn predominate, and pasture land, which is of negligible importance in central and southern Japan, becomes of some significance. Livestock raising is of small importance except in Hokkaido, where pasture is available, and animal products are of minor importance in the food consumption patterns of Japan as a whole. A corollary of this condition is a general shortage of hides and skins for use as leather.

The possibilities for enlarging the cultivated area appear to be few. In 1948, 3.8 million acres were considered capable of reclamation for agriculture. At the end of 1951 over 1 million acres had been reclaimed, chiefly former military lands and airfields. The remainder is submarginal land which may be too costly to reclaim—undrained lakes, marshes, and coastal lagoons, gentle slopes now in brush, fuel-wood scrub in cultivated areas, and grazing land. On the other hand, improvements in drainage of paddy fields could add another 15 per cent to the producing acreage, while the consolidation of field plots through the rearrangement of property holdings might also contribute substantial acreages.

The waters surrounding Japan are a rich source of sea food, the chief domestic source of protein in the Japanese diet. Almost the entire coast is dotted with small fishing villages, and the fishing industry employs close to a million men. The warm Japan Current (Kuroshio), which sweeps northeastward along the southeastern coasts of the country, has temperatures ranging from 68°F. in late winter to 80.1°F. in late summer, and in its waters are found an abundance of fish—sardines (most important of Japan's marine products in volume), mackerel, tuna, bonito, skipjack, albacore, and sea breams. Where the Japan Current meets the cold Okhotsk or Kuril Current (Oyashio) off the northeastern coast of Honshu, there is a zone of mixing, in which both cold- and warm-water fish are found. The waters of the Okhotsk Current, which seldom exceed 64.9°F., harbor herring, salmon, cod, and crab. Both the warm and cold waters also produce large quantities of edible seaweed.

It is estimated that in the period 1935–1940 over 75 per cent of Japan's sea food landings came from waters within 20 miles of Japan proper, exclusive of the colonial sources of supply. Before World War II, Japanese fishermen operated also in far distant waters. In all, over 7 million tons of fish and other sea food were harvested annually. After the war, however, Japan's fishing activities were restricted by Allied agreement to an area bounded on the east by the 165th meridian of east longitude (extended in 1949 to the international date line); on the south by the Tropic of Capricorn; on the north by a line which separates Hokkaido from Sakhalin and the Kurils; and on the west by a line which divides the Sea of Japan in two, cuts through Korea Strait and the East China Sea, and separates the Ryukyus from Formosa. Fish landings primarily from this area, but including

special whaling expeditions to Antarctic waters, totaled 4.2 million short tons in 1951. In 1952, however, the areal restrictions were removed, and fish landings totaled 5.2 million tons.

The possibilities for expanding the annual production of sea foods, both animal and plant, in the postwar period are few. There is evidence that since 1920 overfishing has resulted in a gradual depletion of fisheries resources. As a corollary, fish formerly used for fertilizer are being used for food. As a result of the war, Japan lost the right to fish in northern waters from which much of her highest-quality sea food came—crab, salmon, agar-agar. These were important prewar export products.

Despite the intense utilization of the resources of domestic agriculture and fisheries the Japanese are unable to provide food in sufficient quantity to maintain health. Japan in 1953 produced enough food for only 80 per cent of her population at a standard of 2,250 calories and 70 grams of protein daily. Even if some future increases in the production of food are registered, it is expected that they will be countered by increases in population. See also section on *Agriculture*.

Forest Resources.—More than one half of Japan is forested: 55 million acres of a total of 91.4 million. Of these 55 million acres, 50 per cent are in broad-leaved forest, 29 per cent in conifers, and 21 per cent in mixed forest. Less than 0.5 per cent is in bamboo, a giant grass growing in groves much like tree forest. In addition there are about 6 million acres of brush (*gen-ya*). There are three general forest zones: (1) the boreal zone in northern and eastern Hokkaido and on elevation outliers in Honshu, which is composed of spruce, fir, larch, and birch; (2) the great mixed forest zones, which cover much of Honshu to points south of the latitude of Tokyo and contain both deciduous broad-leaved species—beech, ash, chestnut, poplar, and oak—and natural and planted stands of conifers—chiefly pines, cryptomeria, firs, and cedar; and (3) the southern forests of broad-leaved evergreens and deciduous trees, of which oaks are most important. About 60 per cent of the mixed forests are coppice and fuel-wood stands unsuitable for the production of construction timber. Furthermore, about 6 million acres of forest were still inaccessible in 1954 because of lack of transportation. In 1952 production of wood totaled 1,829 million cubic feet, or slightly below the prewar average and well below the record production of 3,300 million cubic feet set in 1943. Fuel wood accounts for half of the total; before the war, however, it accounted for closer to two thirds of all production.

The importance of wood and wood products in Japan cannot be minimized. With the exception of public buildings and the homes of the wealthy, most of the buildings in Japan are made of wood. Wooden utensils are used wherever possible instead of metal implements. Wood cellulose is used, of course, for the manufacture of paper and rayon, and Japan was sixth among the nations of the world before World War II in the production of wood pulp. Furthermore, the Japanese rely heavily on wood rather than coal for fuel; charcoal is the common heating and cooking fuel in the Japanese household, and charcoal gas provides fuel for a substantial percentage of the motor vehicles. On the other hand, the importance of forests to the stabilization of soils and water resources is immeasurable, and care

must be taken to avoid overcutting and the resultant economic penalties of erosion and floods, which already have been evidenced.

The estimated needs for wood of all kinds—lumber, pulp, fuel, and general manufacturing—at the 1930–1934 level of consumption come to 2.6 billion cubic feet a year of which 1.6 billion cubic feet is for fuel. The growth rate for accessible forests, however, is estimated at some 1.68 billion cubic feet annually, leaving a deficit of around 900 million cubic feet. Before the war Japan, an exporter of both timber and pulp products, imported almost one third of her pulp and a substantial percentage of her lumber from Karafuto. Tropical hardwoods came from Southeast Asia, and some 10 per cent of her softwood production and 30 per cent of the pulp consumed were imported from western North America and the Scandinavian countries. Without these outside sources of supply, Japan cannot be expected to supply her domestic timber needs, let alone exports for markets abroad, without depleting her forest resources.

At the same time, some possibilities exist for the increased and economical exploitation of forest resources. Tapping of existing "inaccessible" forests would make available 146 million cubic feet of wood a year. The placing of marginal agricultural lands into productive forests is a long-range possibility, as are improvements in, and expansion of, reforestation in cut-over areas. In addition, more selective cutting practices at less frequent intervals would eventually provide larger timbers and help prevent the serious soil erosion which is encouraged by present clean-cutting practices. On the debit side, however, is the probability that demand will increase far above 1930–1934 levels as population increases and industrialization continues.

Mineral Resources.—The Japanese islands possess a great variety of mineral resources, few of which, unfortunately, are in sufficient quantity to supply Japan's normal peacetime needs.

Metals.—The variety of metals is especially extensive. Of the 33 metallic minerals used in industry, Japan is supplied to some extent with 22, but only 6—chromite, copper, gold, magnesium, silver, and zinc—are present in sufficient quantity to meet minimum domestic requirements. The possibilities for new discoveries in the post-war period were slight, but not without foundation, since thorough geological exploration had never been accomplished in full. Magnesium is considered to be in unlimited quantity, since it can be extracted from seawater, but commercial production from that source has yet to begin.

Iron ore is present in only small quantities. The major deposit is near Kamaishi in northeastern Honshu, where reserves amount to some 35 million tons of magnetite averaging 60 per cent iron. Lesser deposits, chiefly bog ore, are found in Hokkaido; also, extensive deposits of iron-bearing sands of 30 per cent iron, as yet unexploitable economically, are found in northeastern Honshu. Domestic sources supplied only 12 per cent of Japan's needs before World War II, and, as they become depleted, will remain inadequate to satisfy more than a small percentage of requirements. Imports of at least 2.2 million tons of ore a year will be required; more will be needed as domestic supplies dwindle and industrial expansion develops. In 1952, Japanese iron ore production totaled 1,135,000 short tons of ore, averaging 50 per cent of metal content.

Deposits of low-grade manganese ore are found scattered throughout the islands, but are inadequate for more than a small percentage of requirements. Nickel deposits are even more deficient, and resources of tungsten, molybdenum, vanadium, cobalt, and titanium are meager and inadequate. Tin and antimony deposits also are small and cannot be expected to supply more than 15 per cent of domestic requirements—and then for a short time only. Lead reserves are estimated at 11 million tons of ore containing some 130,000 tons of metal. Annual production is approximately 14,000 tons of metal, about one fifth of the anticipated demand. As for aluminum, there are no bauxite deposits of consequence in Japan, no known aluminum shales, and only small quantities of alunite. Prewar production of aluminum was based on imports of bauxite from eastern Asia and the Western Pacific and of alunite from Korea. Extensive deposits of high-alumina clays are scattered over the islands, but an economical process for their utilization has not been developed.

Gold and silver are found in much of Japan proper, in sufficient quantity to supply anticipated domestic needs. Platinum, however, is available only in minute quantities. Chromite deposits apparently are extensive enough to meet domestic requirements for some years, an estimated maximum of 800,000 tons of ore being in reserve. The chief mines are in southern Hokkaido and in the Okayama-Tottori area of south central Honshu. Production in 1951 reached 15,800 short tons of chrome oxide from ores grossing about 40,000 tons.

Until 1935 Japan produced domestically almost all of the copper she consumed, but thereafter imports rose to meet increased industrial and military demands. Annual production (estimated at 77,000 short tons in 1939 and 59,000 tons of metal in 1952) is sufficient to supply ordinary peacetime needs, although most of the Japanese copper mines have been worked for many years and the best ores have been consumed. The chief exploited deposits are in Akita, Ibaraki, and Tochigi prefectures in central and northern Honshu, and in Ehime Prefecture in western Shikoku. Zinc deposits, estimated at 2 million tons of metal, also should be sufficient to meet annual needs. Production in 1952 was 96,000 short tons of metal. The chief mines are in Gifu, Iwate, and Miyagi prefectures in Honshu, several of which are also major lead producers. Although Japan had been a major importer of zinc since 1900, increased domestic output after 1940 practically eliminated imports.

Coal.—The most important and valuable of the minerals in Japan is coal, whose value amounted to more than half of all the minerals produced in Japan in 1936. Proved, probable, and possible reserves are estimated at 18 billion metric tons, of which almost half is in Hokkaido and 38 per cent is in Kyushu. More than three fourths of Japanese coal is a low-grade bituminous; only 4 per cent is believed to be anthracite; and the remainder is sub-bituminous. Production is costly because of fragmentary, thin, and crooked coal seams; large amounts of ground water in the mines; and the limited use of mechanized equipment. Per ton costs before World War II were almost twice those in the United States; and in 1936 the output per underground worker in Japan was 318 tons, as compared with 1,010 tons in the United

States in the same year. Furthermore, Japanese coal is not only ashy and high in volatile matter, but its calorific value averages between 11,000 and 13,000 British thermal units (Btu.), as compared with a typical United States figure of over 14,000 Btu.

Despite the primary position occupied by coal in Japan's mineral resources, the per capita reserves amount to only 220 metric tons, as compared with the United States figure of 27,000 metric tons and the United Kingdom's 4,200 metric tons. Japan's coal deposits, though by far the most fully exploited in the Far East, are still small in comparison with those of the world's major coal-producing areas.

Coal production during the war averaged close to 60 million short tons annually, as compared with 40 to 50 million tons in the immediate prewar period. By 1947 production had declined to 32 million tons; by 1952 it had risen to 49 million tons, at which figure reserves should last some 200 years. The estimated needs are approximately 50 million tons annually, and production should meet almost all of that demand. Unfortunately, the high-volatile Japanese coals are unsuitable for coking purposes. Formerly coking coal was imported from north China, Manchuria, and Korea. A minimum of 1 million tons of this higher-quality coal must be imported, at least until such time as technological advances make it possible to convert economically Japanese coals to coke.

In addition to the coal reserves there are extensive lignite deposits which are variously estimated at 500 to 2,200 million tons. Most of them, however, are relatively small, scattered, impure, and underground; therefore, technical production problems of size exist. Until 1940 very little lignite was mined (less than 300,000 metric tons a year), but by 1947, 3,250,000 short tons were produced. With increased coal production, however, lignite output fell to 1,700,000 tons in 1952. Although useful primarily as a heating fuel, the 5 to 10 million tons of lignite producible annually would do much to alleviate the fuel shortage in Japan.

Although Hokkaido contains more than half of the total Japanese coal reserves, it produces less than one third of the coal mined and until the outbreak of the Sino-Japanese War in 1937 produced less than one quarter. The greatest output has come from the coalfields of northern and western Kyushu: about 57 per cent in the period 1935-1945. The prospects for future development in Hokkaido, however, are better than in Kyushu, since many of the best seams in the latter island already have been exploited. There are several smaller deposits in Honshu, the chief of which is the Joban field in Fukushima Prefecture, which supplies much of the fuel coal for the Kanto area, and the deposits in western Yamaguchi Prefecture, largely sub-anthraxite, which are ancillary to the northern Kyushu fields. Numerous other deposits exist and are mined in small quantities for local consumption, but Shikoku is said to be without any coal at all.

Petroleum.—Reserves of petroleum were estimated in 1951 to be about 26 million barrels, a negligible quantity for any modern industrialized country. It was possible that this estimate was too low; geological surveys indicate the possibility of additional reserves, but at most Japan will be able to supply only a small per-

centage (10 to 15 per cent) of her petroleum needs, and then only for a limited time. Before World War II, Japan imported almost 90 per cent of her petroleum and petroleum products, and a similar percentage of imports was required in the postwar period. In 1952, Japanese production totaled 2,100,000 barrels, less than 10 per cent of total consumption. The main Japanese oilfields are in Akita and Niigata prefectures in northwestern Japan; secondary pools are found in western Hokkaido; and all belong to the same geological formations.

Minerals Used in the Chemical Industry.—Of these, eight may be considered basic: coal, copper, nitrates, limestone, and sulphur, all of which are produced in sufficient supply in Japan; and salt, phosphates, and potash.

Coal and copper are in adequate, though not in generous, supply. Nitrates, essential for the manufacture of agricultural fertilizers, can be produced artificially by the nitrogen-fixation process. Both high- and low-grade limestone is abundant in Japan and quarries are located on every island. Recorded production, concentrated largely in northern Kyushu, in 1939 was 813 million tons and actual production is believed to have been 20 per cent greater. Reserves are sufficient for at least 200 years and considerable exports are possible. Sulphur likewise is sufficient for anticipated needs. Reserves of close to 60 million tons are known, including 20 million tons of native sulphur and nearly 40 million tons of sulphur content in pyrite deposits. Production in 1952 reached 1,344,000 short tons, a quantity which slightly exceeded domestic demands and which could be produced without strain for another half century. Refined sulphur constituted 156,000 tons of production, the balance coming from pyrites which are used primarily for the production of sulphuric acid.

The lack of adequate supplies of salt in Japan may seem strange in view of the insular nature of the country, despite the absence of deposits of rock salt. The coasts of Japan are dotted with small salt factories engaged in the evaporation of seawater and the extraction of salt. Climatically, however, there are few areas where rainfall is consistently light enough to permit solar evaporation of seawater. Even in the Inland Sea area, where the bulk of Japan's salt is manufactured, the rainfall is close to 40 inches and is spread fairly evenly over the year. Thus, final evaporation is effected in pans over fires of wood, charcoal, and coal or by electrical means (12 per cent before World War II). In 1936, 590,000 tons of salt were produced, while requirements amounted to more than 2.2 million tons. In 1952 production was only 497,000 tons, or about 20 per cent of consumption.

Both phosphates and potash are necessary for the fertilizing of infertile and overused Japanese soils. About 75 per cent of Japan's prewar potash needs and about 40 per cent of her phosphate needs were supplied domestically. Both these materials are derived largely from waste products: night soil, farm manures, bone meal, and fish meal. Some small percentages come from domestically produced bean and seed cake. It was expected that almost 1 million tons of phosphate rock and potassium salts would have to be imported by 1960 to maintain the productivity of cultivable land.

Lesser Minerals and Mineral Products.—Of these, Japan possesses adequate supplies of ar-

senic, bismuth, bromine, cadmium, garnet, iodine, mercury, clays, gypsum, sands and gravels, and building stones. Higher-quality building materials, however, are lacking, and the fine china clays for Japan's china export industry, as well as refractory clays, kaolin, and fine glass sands, are imported. Asbestos, fluorspar, mica, and graphite also must be imported.

Fiber Resources.—It is questionable to what extent Japan is deficient in the domestic production of fibers. She has a supply of wood fibers from her forests and an almost unlimited supply of straw from her grain fields. But in the competition with food crops for agricultural acreage, textile fiber crops have done poorly, especially since 1940. The approximate annual production of hard, chiefly textile, fibers in Japan is 77 million pounds. About one third of this quantity is silk; another third, hemp; and the remainder, flax, jute, ramie, and cotton. The 77 million pounds produced can be compared with the 872 million pounds of fibers necessary for a population of 87,200,000 at a per capita quota of 10 pounds. Furthermore, no wool to speak of is produced in Japan, very little leather relative to the demand, and no rubber. The deficit conceivably could be balanced by the use of wood pulp for rayon, but only at the expense of other wood uses. Since in the postwar period there was a deficit anticipated for some years in wood production, the complete elimination of fiber shortages through the use of wood products seemed hardly probable, though in the long run possible.

Japanese farmers produce an estimated 42 billion pounds of straw fiber each year. About 10 billion pounds is available for fiber uses, hats, mats, raincoats, sandals, rope, packing, wall-board, paper, and padding. Another 13 billion pounds is used for fodder, compost, thatch, and fuel, the remainder being unused or unusable.

Silk has long been the great textile fiber of Japan and was the leading item in its export trade to the West for decades. Most production is conducted as a cash-crop auxiliary to agricultural activity. Silk is far from being a cheap fiber, however, even in Japan, and the costs of producing mulberry leaves, necessary for the raising of cocoons, are maintained at a high level by the pressure on arable land for food-raising purposes. This pressure, as well as the loss of much of the United States market for Japanese silk, was reflected in the diminution of mulberry acreage from 1.45 million acres in the 1931-1940 period to 428,000 acres in 1952. Production likewise has declined, from 95 million pounds in the prewar period to 33 million in 1952. It appears, therefore, that increases in silk production would help counteract part of the deficit in hard fibers, but only at a relatively high price and at the expense of some food production.

Among other possibilities for expanding fiber production was the increased use of inner bark from the silkworm mulberry varieties and related species. In addition, the utilization of synthetic fibers other than rayon (nylon and the like) was anticipated, but no production in quantity had taken place by 1952.

If Japan were to regain an export trade at all similar to that preceding World War II, it would be necessary for her to import vast quantities of raw cotton and wool as well as wood pulp, abaca, jute, ramie, kapok, and flax. Therefore, although by the judicious utilization of wood

pulp and straw Japan might counter certain of her fiber deficiencies on a domestic basis, for the re-establishment of overseas trade she would continue to be a fiber-deficit country. See also section on *Agriculture*.

Power and Fuel Resources.—Japan is fortunate in having a relatively high hydroelectric power potential due to the ample precipitation throughout most of the country and to a mountainous topography laced with short, swift-flowing streams. On the basis of a six-month flow, the potential waterpower available is estimated at 10.9 million kilowatts. At the beginning of 1951, Japan had 1,424 hydroelectric plants in operation with an installed capacity of 6.56 million kilowatts. Several plants were under construction, and were expected by late 1953 to bring the total hydroelectric capacity to 6.94 million kilowatts. Most of the plants are small. In 1951, 88 per cent of them had installed capacities of less than 10,000 kilowatts. Of the 51.6 billion kilowatt-hours produced in Japan in 1952, 78 per cent were of hydroelectric origin.

On the other hand, hydroelectric power plants operated at an average of only 66 per cent of theoretical capacity in 1950. The reasons for this seeming insufficiency are two: (1) the irregularity of rainfall and runoff, which has prevented the even distribution of power production over the months; (2) the scarcity of storage dams and reservoirs, the means for equalizing water resources over the year. Only an estimated 1.2 billion kilowatt-hours, or 3 per cent of total annual production, are available from existing storage facilities. Hydroelectric plants are scattered throughout Japan, but are concentrated in greater numbers in certain areas. In terms of percentage of national hydroelectric capacity in 1951, the plants were distributed as follows: in Kanto, 23.7 per cent; in Kansai or Kinki, 19.1 per cent; in Tohoku, 16.2 per cent; in Chubu, 12.8 per cent, and in Kyushu, 9.5 per cent; the balance was spread in other areas.

As a supplementary source of power there were at the beginning of 1951, 273 thermoelectric plants in Japan with an authorized capacity of 3.99 million kilowatts. These, combined with the hydroelectric plants, gave Japan a total electric power capacity of 10.55 million kilowatts, roughly equal to that in the states of Illinois and Michigan combined. This figure is misleading, however, since neither the hydroelectric nor the thermoelectric plants operated at full capacity. The actual production from public utility thermoelectric plants in 1949 was estimated at about 40 per cent of the installed capacity, and at no time has the actual output amounted to more than 75 per cent of capacity even under the press of wartime conditions. Although thermal plants are distributed widely, there are major concentrations in the Kansai or Kinki region (32.2 per cent at the beginning of 1951), in Kyushu (22.5 per cent), in the Kanto region (12.5 per cent), and in Chugoku (11.2 per cent). The largest thermoelectric plants are in Osaka-Kobe, Tokyo-Yokohama, and Nagoya. Since the monthly variations in hydroelectric output may amount to some 1.1 billion kilowatt-hours, 40 per cent or more of the thermal plants are necessary for standby and auxiliary purposes. The remainder are necessary where hydroelectric power is inadequately supplied, as in the largest cities.

When reduced to equivalent heat units, all

domestic sources of fuel and power can supply 90 million Japanese annually with 16.9 million Btu. per capita. About 75 per cent comes from coal and lignite, 9 per cent from hydroelectricity, and 12 per cent from fuel wood. If total mechanical power is considered, however, it is estimated that there will be an equivalent of 1,353 kilowatt-hours per capita available. Of this energy, 56 per cent is from coal and 33 per cent from hydroelectricity, with coal increasing somewhat in importance in relation to hydroelectricity. This compares favorably with the per capita consumption in 1930-1934, but falls far short of the consumption after 1936; it is equivalent, however, to only about 10 per cent of the per capita electrical equivalents available in the United States in 1945.

5. AGRICULTURE. Agriculture is the backbone of Japan's economic life. The unprecedented progress of industrialization in Japan before World War II tended to obscure this fact, but in reality the importance of agriculture was very great even then. The war saw the destruction of much of Japan's industrial fabric and the loss of many of her foreign markets. Agriculture was the only segment of Japanese economy that survived the defeat of the country in relatively good condition. In 1952 the rural population accounted for almost 43 per cent of Japan's 86,000,000 people and provided from 80 to 85 per cent of the food consumed by the Japanese. In terms of capital invested and net value of output, agriculture is by far the country's leading industry. And all this agricultural structure rests on only 15 million acres of cultivated land, made up of minute, well-tilled farms and gardens.

Roughly 75 per cent of the area of Japan is hilly or mountainous, with slopes usually too steep, and soils too thin, for ordinary cultivation. With a few notable exceptions, the typical Japanese plains consist mainly of narrow coastal lowlands; they are found also along the banks of some of the larger rivers or along the bottoms of narrow, steep-sided valleys. This preponderance of highlands with steep slopes and rock wastes sets definite and striking limits to the cultivated area and explains why only some 16 per cent of the total estimated land area of Japan is cultivated. Compared with that of other countries, the ratio is small; before World War II, Italy cultivated 41 per cent, Germany 40 per cent, France 39 per cent, and Great Britain 22 per cent, of the total land area. Even in the continental United States, 18 per cent of the total area is under cultivation. See also section on *Natural Resources*.

Climate.—In northern Japan, where snowfall is heavy, a second crop on rice fields is very difficult, if not impossible; where it is practiced, damages are extensive. Somewhat the same is true of frost in the north and in some other regions of the country. The typhoon, too, contributes its share of damage. It is almost a yearly occurrence, usually taking place in August

and September. The typhoons are accompanied by severe rainstorms that bring in their wake floods and damage to crops.

From the point of view of utilizing fully the available soil resources, Japan enjoys ample precipitation. Rainfall for the entire country ranges between 40 and 100 inches annually. From north to south, and through the entire north and some of central Japan, precipitation varies from 40 to 60 inches. The heavier rainfall occurs west and south of this belt. The seasonal rains in June and July, together with the fairly dry weather in August, are peculiarly suited to the growing of irrigated rice. On the whole, precipitation is sufficient to meet the needs of Japanese agriculture, and normally almost no region suffers from a shortage of water for crops. Occasionally rains result in devastating floods; for example, in 1953 they caused considerable loss of life in Kyushu as well as property damage estimated at \$100 million.

Soils.—There are many kinds of soil in Japan, but for purposes of description, three main groups may be defined: (1) the podsolc soils of a large part of Hokkaido and of the highlands of Honshu; (2) the brown soils of southwestern Hokkaido and the northern and central parts of Honshu; and (3) the yellow and red soils of the remaining part of Honshu, together with all of Shikoku and Kyushu.

Japanese soils are not naturally very fertile. The greater part appear to be inferior in this respect, and high yields seem to have been obtained in most cases only by careful attention to the needs of each particular soil situation. In upland and paddy soils, where a legume is grown as a winter crop, lime must be applied to make up the deficiency of calcium. The application of phosphorus is often found profitable, and in certain cases potash is necessary. Nearly all the soils are strongly deficient in nitrogen. A painstaking effort to meet the needs of these soils is the chief reason for the success Japanese farmers have had in securing high levels of production.

Farm Population.—In the mid-19th century, when Japan came into contact with the West, almost 80 per cent of the people were classed as farmers. The proportion of farmers in the total population decreased to 48 per cent by 1930, and to 40 per cent by 1939. This decline in ratio was due not to a decrease in the farming class but to an increase in the nonfarm population. There was, in fact, an increase in the total number of agricultural families, which reached a prewar maximum of 5,642,500 in 1932, compared with 5,518,000 in 1886. The number of farm families in 1947 was 5,900,000, and in 1952 it was estimated at 6,200,000. The rise in the number of farm families was attested by the general rise in farm population. After World War II the total farm population increased to a point where it constituted almost half the total population in 1949. This was in no way a reflection of any improvement, or greater absorptive capacity, of Japanese agriculture. On the contrary, it reflected the immediate postwar industrial and commercial dislocation of Japan, the country's slow economic recovery, and, by the same token, the steady movement of expatriates and unemployed from the cities to the villages, where they hoped to eke out a living from the farms of their relatives. Economic recovery thereafter served to reduce the ratio of farm population to the total.

Land Utilization.—The land of Japan falls into four groups: cultivated, forest, pasture, and wasteland (*gen-ya*) and land under various other uses. In 1939, cultivated land represented 16 per cent of the total area; forest land, 55 per cent; pasture, 8 per cent; and land in other uses, 21 per cent. This relationship had not changed to any material degree by 1954.

Forested hills and mountains, which account for 55 per cent of the country's surface, are the basic limiting factor in the expansion of the cultivated acreage. The forests are primarily mountain forest and generally of poor quality. Nearly half of them consist of dwarf woods fit only for fuel. The grasses of the pasture land are of poor quality, and the limited attempts to improve them have not been successful.

Cultivated land is scarce in relation to the rapidly growing population as a whole as well as to the farm population. The Japanese government has been well aware of this fact, which explains to a degree not only the development of industry and foreign trade, but, above all, the official policy of attempting to increase crop acreage and the productive capacity of the land.

By the time of the Meiji Restoration of 1868 most of the level land had already been taken up by the farmers. To increase their acreage they had to turn, and successfully, to the remaining lowlands, the mountain slopes, and the hillsides in spite of heavy expenditures and other unfavorable conditions. The cultivated area between 1880 and 1921 increased 36 per cent, from 10.5 million to about 15 million acres. Since 1921 the cultivated acreage has remained almost unchanged. In fact, due to acquisition for military purposes, the cultivated area actually decreased by about 500,000 acres between 1937 and 1945.

The effort to expand the land under cultivation gained momentum early in the Allied occupation of Japan following World War II. Former military land and other readily available tracts were promptly made available for cultivation. The Japanese government estimated that nearly 4 million acres were still reclaimable as crop land. In the main, this was a rather optimistic estimate. Since most of the desirable land was already in use, the greater part of the reclaimable land left was inferior to the land in cultivation. The cost of reclamation on some land was prohibitive, and land which was not suitable for reclamation was included in the program.

In 1954 the total arable land was estimated at 15.5 million acres. The acreage would have been larger but for the fact that a good deal of land had shifted to nonagricultural purposes. A total of 880,000 acres of uncultivated land had been reclaimed from September 1945 to July 1, 1949, providing new farms for 172,000 settlers and additional cultivated land for 500,000 local farmers. By the end of 1951 a total of over 1,000,000 acres had been reclaimed. It should be noted, however, that this was land that lent itself to reclamation very easily and at relatively little expense.

Farming Practices.—*Intensive Cultivation.*—Since the pressure on the land is so great, the fields of Japan are cultivated intensively; they are treated much more carefully than many a garden in other parts of the world. The rice fields are graded to level, and each is surrounded by dikes. Many of the upland fields are also leveled and made secure by terracing. Leveling not only facilitates working, but enables the land to retain

all natural or artificial fertilizers, making possible the continuous growing of such heavy-yielding crops as irrigated rice, as well as multiple crops on the upland. All this calls for an immense amount of labor. Careful cultivation, constant weeding, repeated applications of fertilizers, painstaking watering of crops where irrigation is lacking, multiple cropping—all these are indicative of the intensive cultivation of the fields.

Multiple Cropping.—A characteristic feature of Japanese agriculture is that two successive crops are grown each year on a large part of the land. Two crops of rice are rare, but from 30 to 40 per cent of the irrigated rice land, except where the climate is least favorable on account of severe winters, is replanted to winter crops, such as wheat and barley. On the upland fields (unirrigated cropped land) also, the same unit of land produces more than one crop each year, farmers commonly having three or more crops growing at the same time in different stages of maturity. Because of the practice of double and multiple cropping, there is a distinction in Japan between cultivated and harvested area. For instance, in 1939 Japan's harvested area amounted to 20 million acres, or one third more than the land reported as cultivated. Practically the same was true in 1952.

Fertilizing.—Fertilizers are of unusual importance in a country like Japan, where the system of agriculture is very intensive and a scarcity of agricultural land makes it important to secure high yields from every field. Understanding the necessity to fertilize, Japanese farmers for many years have fully utilized materials locally available—mainly compost, night soil, green manure, and wood ashes. Bean cake and fish fertilizers were added to this list following a development of the soybean industry in Manchuria and of the fish-packing industry in Japan. More recently, large quantities of chemical fertilizers, particularly ammonium sulphate and superphosphate, have also been employed.

It is a common practice of farmers in Japan to dump fertilizers of various kinds into a shallow cement storage cistern to which water is added. The manure is allowed to decompose, and when field applications are to be made, the liquid fertilizer is ladled out of the cistern and carried to the field in large wooden buckets. The Japanese farmer does not spread the fertilizer over his field, but applies it directly to the growing plant. It is poured over the plant so that only the soil next to the crop is fertilized.

Despite the great importance of chemical fertilizers in Japanese agriculture, the role of farmyard manures is undiminished. It is estimated that during 1936–1940 the percentage of the total quantities of fertilizer nutrients supplied by farm manures was as follows: nitrogen (N), 48 per cent; phosphoric acid (P_2O_5), 35 per cent; potash (K_2O), 74 per cent. In 1946 total consumption of farm manures (compost, night soil, green manures, and others) on a fertilizer-equivalent basis was 4.5 million tons.

In 1935–1937, it was estimated that in terms of pounds per acre of arable land, Japan was third among the nations of the world in the total amount of nitrogen derived from organic and inorganic fertilizers, with 37 pounds per acre of arable land; fifth in phosphoric acid, with 34 pounds; and fifth in the amount of potash, with 15 pounds. During the same period, Japan was the world's largest user of ammonium sulphate.

In the 1920's and 1930's, Japan built up a large fertilizer industry. Peak production of commercial organic and inorganic nitrogenous fertilizers occurred during 1936-1940, when an average of 1,800,000 metric tons of ammonium sulphate equivalents was produced annually. Production of such fertilizers declined rapidly after 1941, and by 1945 it amounted to only 335,000 metric tons. The period 1936-1940 was also the peak period of production of inorganic and organic forms of commercial phosphatic and potassic fertilizers. The yearly average was 1,900,000 metric tons of superphosphate equivalents and 20,000 metric tons of potassium sulphate equivalents. In this instance, too, by the end of the war production was at its lowest level.

In consequence of a major effort on the part of the Allied occupation authorities and the Japanese government, the fertilizer industry made very rapid recovery after the war, but fertilizer availability was still far from prewar levels; in 1949 commercial organic and inorganic fertilizers accounted for only 64 per cent of the 1936-1940 average. In 1952, however, the fertilizer industry not only provided for the country's needs, but was in a position to export fertilizer products. In that year, Japan produced nearly 2,000,000 tons of ammonium sulphate equivalents (20 per cent N), 1,400,000 tons of superphosphate equivalents (16 per cent P_2O_5), 530,000 tons of potash (40 per cent K_2O), and a not insignificant quantity of other chemical fertilizers. The total volume of chemical fertilizers was in excess of 3,900,000 tons.

Use of Labor and Equipment.—The intensive work performed on Japanese farms from planting to harvesting is carried on almost exclusively by hand. With some minor exceptions, motor-driven machines are scarcely ever used in seeding, fertilizing, and harvesting, although animal power often is used in plowing. Even in Hokkaido, which is best suited to mechanization, animal-drawn farm implements have been in use for generations and no need has been felt for replacing them with modern equipment.

The farm equipment used in field work is light and of the simplest construction. The dikes and ditches could not stand heavy equipment and in the tiny fields too much maneuvering of the machinery would destroy the crop. Aside from physical factors, mechanization has been retarded for economic reasons. Human labor is abundant, and this fact in itself tends to preclude the use of labor-saving devices.

To assume, however, that mechanization is an unknown quantity in Japanese agriculture would be erroneous. Japanese farmers employ some mechanical equipment adjustable to the size of the farm, but it is employed to process agricultural products and no mechanical equipment is used directly in raising crops. Before World War II, for example, one electric motor was used per 107 farm families, and one gasoline engine per 22 farm families. The electric motors averaged not more than 1.5 horsepower; the gasoline engines, 3 horsepower. After the war there was a sharp increase in the utilization of farm equipment, some motorized. Between 1937 and early 1952 the number of threshers (129,000) and hullers (192,000) increased threefold; that of mechanical pumps (44,000) more than threefold, and that of electric and gasoline engines from 188,000 to nearly 650,000. Considering the number of farm households, the use of such equipment

was far from widespread, but progress was undeniable.

Livestock.—Japanese agriculture has only a limited livestock industry despite the preponderance of highlands. There are two principal reasons for this: (1) There is a lack of good natural pasture land, because the native wild grass is coarse and unnutritious and generally crowds out the valuable forage grasses. (2) Farming is limited to the cultivation of the soil for the produce derived directly from it, because in a densely populated country with limited food resources the food value produced from an acre under grains is 6 to 7 times larger than the food value of the meat or milk that can be obtained by feeding the grain to livestock.

Cattle and horses are raised chiefly for draft purposes and for stable manure. The total number of cattle prior to World War II averaged 1,800,000 and reached a peak of 2,300,000 in 1945. In the immediate postwar period the number was considerably reduced, but it was estimated that in 1949 it attained the 1945 level. Horses in 1949 were estimated at 1.1 million, or about one fifth less than in 1930-1934. Hogs play a particularly small role in the farm economy of the average farmer, and at no time has their number exceeded 1,000,000. They declined sharply in the war and postwar years, and in 1949 there were only about 500,000 hogs in Japan. By 1953 the livestock industry was above prewar levels in virtually every category; the most notable gains were in cattle, horses, sheep, and poultry. Yet numbers were still small in relation to the number of farm households. In 1952 the number of cattle per farm household averaged .4; that of horses, .3; that of hogs, .2. Japan has considerable possibilities of increasing and improving its livestock industry, but in order to do that it must concentrate on the formidable task of improving its pasture and grazing lands.

Agricultural Production.—The cultivated land of Japan falls into two main groups: (1) rice fields (irrigated land), and (2) upland farms (unirrigated land) that produce other crops. Many of the cultivated crops in the uplands are also grown on rice fields as winter crops.

A distinguishing feature of Japanese agriculture is the preponderance of food crops, of which rice is the most outstanding. The emphasis upon rice is probably no accident, because the type of agriculture developed has been influenced largely by the amount of cultivable land available in relation to the population. With relatively little land suitable for cultivation, with a rapidly growing population demanding larger supplies of food, and with a fixed government policy to encourage self-sufficiency in food, the concentration upon food crops was natural. Rice became the dominant food crop because under Japanese conditions it yields more calories per unit of land than any other cereal. Individually, other food crops are not so important to Japan as rice, but taken together they utilize over 40 per cent of the harvested area. All food crops together account for four fifths of the land under crops.

During World War II and immediately thereafter agricultural production in Japan declined, but thereafter considerable recovery took place. This was particularly true of food crops. Just before the war the harvested acreage under food crops was slightly over 14 million acres, or only 150,000 acres more than the area under the same crops in 1948. The general trend of acreage,

production, and yields before and after World War II are shown in Table 1. With the exception of the wheat acreage and that under mulberry and tea, the recovery was very marked, and it should be noted that the decline in the acreage planted to tea and mulberry was due to a sharp decline in foreign demand for tea and silk.

In 1952, as in the past, rice dominated Japanese agricultural economy. Fully 55 per cent of the cereal acreage was under rice. Rice is used at practically every meal; although other grains are consumed, they supplement rather than replace rice. Efforts to increase the yield of rice have been most successful and Japanese yields are the highest in Asia. In comparison with other principal rice-producing countries, such as Indochina, the Philippines, Thailand, Burma, and India, the Japanese yields are from two to three times larger. This success was achieved through ample use of manpower, improved rice varieties, abundant use of fertilizers, and improved agricultural practices. In Japan, 96 per cent of the rice acreage is irrigated; the remaining upland rice area is without irrigation. The cereal is planted in May and June and harvested from August to November.

Despite the high yields of agricultural products, however, the total output is not sufficient to provide the country's basic food requirements. Before the war Japan had to import approximately 15 per cent of the food it consumed. The annual production of staple crops (rice, wheat, barleys, sweet and white potatoes) in terms of

brown rice equivalents reached a prewar peak of 14,615,000 metric tons in 1939. During the war years, production held up well until 1945, when fertilizer shortages and unfavorable weather caused short crops. In 1948, total production of staples was 13,927,000 metric tons, or 6 per cent more than the average annual production of these crops during the period 1931–1940, but still 5 per cent less than in 1939. In the meantime the total population of the country had increased by more than 10 million and the food shortage in terms of prewar consumption was greater than ever before. The estimated deficit in terms of staple food requirements for the year 1952 was nearly 4 million metric tons. Japan's chances of becoming self-sufficient in food in the foreseeable future were rather poor. Any success in such an attempt would depend upon one or more of the following factors: (1) expansion of arable acreage, (2) higher yields, (3) additional labor for the cultivated acreage, and (4) the effect of agrarian reform upon the food supply. An examination of the likely trends in the development of these factors indicated, however, that Japanese agriculture would not be in a position to satisfy the basic food requirements of the growing population. On the contrary, Japan's dependence upon imported foodstuffs would continue to grow.

Social Factors in Japanese Agriculture and Postwar Changes.—The fact that more than 6 million farm families cultivate 15 million acres of land indicates that the size of the farm units is quite small, averaging about 2.5 acres. In

southwest Japan, farm units are generally under 2 acres in size, with some of the holdings along the Inland Sea averaging 1.5 acres. In northern Honshu this figure increases to 3.5 acres, and only in the northernmost, sparsely populated island of Hokkaido do the farms average 12.5 acres. The size of holdings actually cultivated shows that approximately one third of all households cultivate less than 1.2 acres each; 33 per cent, from 1.2 to 2.4 acres; and only about 10 per cent, more than 5 acres. Moreover, the 15 million acres of cultivated land are divided into approximately 100 million plots, which means that most Japanese farmers work on small plots, often resembling gardens rather than fields.

Before the Allied occupation of Japan in 1945 one of the characteristic features of the Japanese land system was the striking concentration of land ownership. About 50 per cent of all the farm households owned only 9 per cent of all the land, whereas 7.5 per cent of the households owned 50 per cent of the land. The corollary of this situation was that the holdings cultivated by a Japanese farmer did not correspond with the amount of land owned by him. This inequality in landownership was expressed in terms of owners, part owners and part tenants, and tenants. Until the end of 1947 about 31 per cent were independent farm owners; 42 per cent, part tenants and part owners; 27 per cent, tenants who owned no land at all.

The small acreage cultivated by the average farmer was in itself an explanation of his poverty, but the situation was made worse by widespread tenancy and by the conditions under which the tenants worked the land. Land hunger and the intensity of competition for land ownership and cultivation rights preserved land values and rental rates far above a level justifiable by the productivity of the soil. Rentals of 50 per cent of the rice crop and only slightly less of other crops were customary. In addition, the tenant had to meet a number of other assessments and dues, buy his own expensive fertilizer, and provide the farmhouse, farm buildings, implements, and seed. The share from which he drew his living frequently represented not more than 30 per cent of the crop. Under these conditions the life of an average Japanese tenant prior to World War II conformed to the feudal adage that "farmers should neither live nor die."

The lot of the small owner-cultivator was better only by comparison. Until the more prosperous war and postwar years the standard of living of the vast majority of the Japanese farmers was very low. And it is precisely the marginal existence of the small Japanese owner-cultivator and tenant that explains, but only in part, why Japan's 15 million acres of cultivated land can support more than 6 million farm families. The results of numerous studies carried out by the Ministry of Agriculture before the war indicate that the average peasant generally could not make ends meet solely by farming. Even the peasant proprietor had practically no surplus at the end of the year. Naturally, the status of the tenants was considerably worse. Subsidiary occupations, therefore, have always played an important role in the life and work of the Japanese farmer. It has been estimated that the income from such sources ranged from one fifth to nearly one third of the total income before the war.

That agriculture was not a sufficiently profitable enterprise for most Japanese farmers, espe-

cially for tenants and part tenants, is further indicated by the fact that a Japanese farmer could count upon a surplus only when his holding was about 4.5 acres, or nearly twice the theoretical acreage he cultivated. Even the industry and thrift of the farmer cannot obviate the fact that the income of a farm family is the product not only of output per acre, but of the number of acres as well. In Japan the output per acre is large compared to that of most Western countries, but the acreage per farm is so small that the total income per family is only a fraction of that in the West.

Farm living conditions improved during and immediately after the war in consequence of great food shortages, inflationary conditions, high prices, and black marketing. It was clear, however, that this essentially paper-money prosperity was not going to last very long and that the basic economic and social problems of the Japanese countryside would reassert themselves unless drastic changes were affected in the existing land ownership pattern, in the cooperative movement, and in the services rendered by agricultural research and science. With that view in mind, a strong effort to improve the conditions of the majority of the Japanese farmers and to give rural Japan a greater measure of economic, political, and social stability was made under the direction of the Allied powers after their occupation of Japan.

Land Reform.—On Dec. 9, 1945, Gen. Douglas MacArthur, the supreme commander for the Allied powers (SCAP), issued a directive to the Japanese government that it "take measures to insure that those who till the soil of Japan shall have a more equal opportunity to enjoy the fruits of their labor." As a result of this directive, the Japanese government enacted, on Oct. 21, 1946, the Special Measure for the Establishment of Owner-Farmers (Land Reform Law) and Agricultural Land Adjustment Law of 1946. This legislation provided the legal basis for land reform. It had two main objectives: (1) transfer of land ownership to farmers who actually till the soil and (2) improvement of farm tenancy practices for those who continue as tenants. The underlying principle of the legislation was private rather than state, and individual rather than collective, ownership of the land.

In accordance with the main provisions of the legislation, all the land of absentee owners is made subject to sale. Resident landlords may retain 2.5 acres of tenant-cultivated land, except in Hokkaido, where they are permitted 10 acres. The size of holdings of owner-cultivators is also subject to limitations in order to place the ownership of the maximum amount of land in the hands of as many former tenants as possible. The government purchases the land at an average price of 3,000 yen per acre for rice land, and 1,860 yen per acre of dry or upland fields. In addition, the owners receive a government subsidy of 880 yen per acre for paddy fields, and 520 yen per acre for uplands. This subsidy, however, is not paid on more than 7.5 acres per individual seller in Honshu, Kyushu, and Shikoku, and on more than 30 acres in Hokkaido. The government pays the landlords in 24-year annuity bonds bearing interest at the rate of 3.65 per cent per year. A tenant may discharge his obligation in one payment or in several (not exceeding 30 annual installments), at an annual interest rate of 3.2 per cent.

Another basic provision of the land reform is the reduction in rents and the elimination of rent payments in kind at a fixed proportion of the crop. Rents must be made in cash at a stated amount, which may not exceed 25 per cent of the value of the rice crop and 15 per cent of the value of other crops. The land reform also outlaws a long-standing grievance of the tenants—the custom of renting by a verbal agreement which landowners might terminate on short notice. A written contract specifying the rent, the period of tenure, and other terms of the agreement is registered in the village office. It conforms to a model contract prescribed by the Japanese Ministry of Agriculture and Forestry.

By 1950 approximately 2.7 million cultivators—tenants or part tenants—had acquired in ownership 27 million separate tracts of land with a total area of approximately 4.5 million acres. The cultivated land area operated by tenants before the reform had been reduced from 6,300,000 acres to approximately 1,670,000 acres. Through these changes the lot of the average Japanese tenant had been measurably improved. They had finally achieved what every farmer the world over strives for—individual ownership of land. In achieving that they also secured a stake in the society in which they live, thus bringing Japan closer to the creation of a stable, middle-of-the-road agricultural society. Such an accomplishment marked a peaceful revolution in the social and economic pattern of Japanese agriculture and weakened measurably the tie that had bound the Japanese peasantry to forces of militant reaction and equally militant nationalism.

Cooperatives.—The brighter side of Japan's agricultural economy has been the widespread development of the cooperative movement, which has become the mainstay of the country's agriculture since 1900. The Japanese government and the farmers have understood that the extremely small size of the holdings makes it essential that farmers pool their efforts and resources through cooperatives. The main functions of the cooperatives are confined to the provision of credit, the making of sales and purchases, and the joint utilization of warehouses, milling establishments, and farm equipment. Between 1900 and 1939 the number of cooperatives increased from 21 to over 15,000 with a membership of nearly 7 million. Approximately 70 per cent of the membership was represented by farmers.

The Japanese agricultural cooperative movement was from its inception primarily a government-sponsored movement. During the war cooperatives became mere instruments for carrying out the aims of the military as they affected agriculture. They served to control agricultural prices and production, to handle collections and rationing, and to siphon rural capital for the war effort.

During the Allied occupation the cooperatives underwent certain changes designed to free them from undue domination by the government and to make certain that they were dedicated to the economic and cultural advancement of the Japanese farmers. In accordance with Law 132, which became effective on Dec. 15, 1947, the cooperatives were authorized to perform practically any economic service which contributes to the advancement of farm communities. Fifteen or more farmers may organize a cooperative. Membership is voluntary, and each farmer member has one vote. Persons residing within the business area

of the organization may be associate members with all privileges except voting. Two or more cooperatives may organize a federation of agricultural cooperatives; such federations may perform any activity which the local cooperatives are authorized to perform, except that if a federation is engaged in making loans and receiving deposits, it is prohibited from performing additional functions not connected with these activities. A cooperative may be organized as a capital stock or a nonstock association, but no nonstock association may carry on both the functions of making loans and of receiving deposits. Liability for a share is limited to the amount of the share or, in the case of a nonstock organization, to the amount of the authorized fee. The primary responsibility for carrying out the agricultural cooperative program is vested in the Ministry of Agriculture and Forestry. As of June 30, 1949, a total of 33,000 new cooperative associations and federations were approved under the new law. The volume of business recorded for the year 1948 shows that the cooperatives handled 36 per cent of all farm purchases, 61 per cent of all farmer sales, 64 per cent of financial deposits, and 71 per cent of loans to farmers.

Cooperatives are undoubtedly of great benefit to the farm community. In the past they alleviated many financial burdens, although they could not cure the problems of indebtedness, usurious interest rates, taxation burdens, and the unfavorable relationship between prices farmers received for their products and those they had to pay for the commodities they purchased. In 1954 it was safe to assume that, whatever the difficulties under which Japanese agriculture must operate in the future, the work of the cooperatives would undoubtedly serve to mitigate them.

Agricultural Research and Science.—One of the principal agricultural policies of Japan has been to increase production so as to make the country as nearly self-sufficient in food supplies as possible. Considering the agricultural resources of Japan, this policy has been successful. As early as 1879 the government launched a program of agricultural experiment work. It established and financed experiment stations where improvements in fertilizing, selection of seed, and development of new varieties first took place. These were subsequently applied by the farmers with telling results. In the words of a student of Japan's agricultural economy, the program was "a chemical and botanical revolution" fostered by the government. By the end of World War II, Japan had 386 national and prefectural agricultural experiment stations, 164 sericultural stations, 139 livestock breeding or animal hygiene stations, and 9 tobacco stations. In addition, there were 83 agricultural educational institutions, 20 miscellaneous government institutes, and 91 private institutions devoting at least part of their time to agricultural research.

The entire work of research and science in agriculture was decentralized, uncoordinated, and, in many instances, overlapping. The agricultural experts attached to SCAP recognized the notable results achieved by the Japanese in this field, but they also were aware that the existing agricultural experiment station system was not conducive to efficiency and coordination of research. In many instances individual stations did not have sufficient financial support to attract highly trained personnel, to buy modern equipment, and to deal successfully with the practical problems

confronting the farmers. The advice given to the Japanese government by United States specialists was embodied in the Law for Improvement and Promotion of Agriculture, enacted on July 5, 1948. The Agricultural Improvement Bureau, dealing with research, extension, and statistics, was established in the Ministry of Agriculture and Forestry in August 1948, to administer the new law. Research requirements were consolidated by 7 regions in order to determine the stations that could best serve the needs of the nation as a whole. The program provided that 135 stations be closed, 53 stations be combined, and 191 stations be continued. Funds, essential projects, and the best-trained personnel were to be transferred to the remaining stations. Prefectural agricultural experiment stations and their branches would be administered by a single staff in each prefecture. The National Agricultural Experiment Station and its regional stations would each have a separate administration, but the work of the branches would be directed by the national station.

Along with improvement in agricultural research and science, measures were taken to improve the means of transmitting technical knowledge to farmers. Since 1899, Japan has had an agricultural extension system under which the government provided each village with one or more agricultural technicians who worked with farmers in improving their agricultural practices. In addition, many of the agricultural cooperatives employed technicians to advise farmer members on production problems. This technical guidance and advisory service was effective, and it was a primary factor in the record increases in the yields of many crops in Japan prior to 1940.

Much of this extension work had fallen into disuse during the war years, and after the war an agricultural extension system was being developed under the provisions of the Law for Improvement and Promotion of Agriculture. More than 6,000 farm advisers were selected from lists of qualified candidates and assigned to duties as extension workers in the rural villages of Japan. The goal of the program was the assignment of an adviser for each of Japan's 10,500 villages. Of the 46 prefectures, 39 have from 2 to 13 home advisers engaged in field work, and more than 3,300 rural youth project clubs have been organized in farm communities.

Agricultural Prospects.—Even the most thorough agrarian improvements, economic and social, will not solve all the problems of rural Japan. There is simply not enough arable land in Japan to give the enormous farm population the reasonable assurance of a decent standard of living. If all the cultivated land in the country were to be equally distributed, the average holding would amount to only 2.5 acres, or nearly 2 acres less than the amount estimated as necessary to make farming in Japan profitable. Since the rural areas contribute the larger part of the annual increase in the Japanese population—at present (1954) somewhat more than 1,000,000—agricultural congestion is expected to be aggravated. Under the circumstances, the amelioration of the lot of the farm population, rather than an ultimate solution of the agrarian problem, is all that can be hoped for. Lasting answers to the problems which are inherent in an agricultural economy of "too many people on too little land" can come only through expanded industrialization and commerce, which decrease

Japan's dependence on home-grown food and absorb the surplus rural population, and eventually from a falling birth rate.

6. INDUSTRIAL DEVELOPMENT.

The tempo of industrialization in modern Japan sustained over half a century has rarely been equaled in the Western World. When Commodore Matthew C. Perry visited the Japanese islands in 1853, he found a nation of approximately 30 million people living in a stage of economic development no more advanced than that of 15th century Europe. Most of them were unfree, impoverished peasants cultivating their tiny farms with primitive methods handed down from their ancestors. A meager development of internal trade and handicrafts supported the limited population of castle towns and cities. The latter found employment mainly in serving the needs of an aristocratic ruling class who lived off the proceeds of feudal rice revenues extracted from the farmers. By 1940 Japan had transformed herself into a front-rank industrial power. She now supported a population of 73 million people at a standard of living well above anything their grandfathers had known. A quarter of her working population was engaged in industrial pursuits, which had come to furnish 40 per cent or more of her greatly expanded national income. When this industrial potential was mobilized for total war after 1941, Japan quickly overran the entire Far East. She was only brought to her knees when the world's greatest industrial nation was free to project an overwhelming power across the Pacific and to strike against the shipping lanes and inflammable cities which were the arteries and heart of her modern industrial system.

Foundations of Modern Industry, 1868-1893.

—The foundations of industrial Japan were laid in the first quarter century after the Meiji Restoration of 1868. With feverish energy the young clan bureaucrats who had risen to national power around the emperor set to work to destroy the crumbling edifice of feudalism and build the new nation-state. Machine industry, mining, and commerce were among their most urgent concerns, for these could supply the economic sinews of national power. Students were sent abroad to learn the new Western technology; foreign experts were invited to Japan; machinery and equipment were imported in increasing amounts;

and state funds were applied to the founding of pilot factories, mines, and technical schools.

By 1893 industrial capitalism in Japan had passed through its early formative stage and was preparing for rapid expansion in subsequent decades. Here, as in other aspects of modernization, the Japanese responded eagerly to the quickening ideas and ambitions imbibed from the West. The speed and momentum of development, however, reflected a growing spirit of commercial and industrial enterprise long latent in Japan and now released from the stifling restrictions of the *ancien régime*. Other favorable factors of social tradition, geography, and historical circumstance also helped to produce aggressive leadership in forging a united nation able to seize upon the opportunities now afforded by entry upon the world stage.

Given Japan's tradition of mercantilism and feudal clan monopoly, it was natural that the new Meiji government should lead in industrial pioneering, in close association with influential commercial and industrial magnates. Moreover, only the state was able at this time to mobilize the necessary capital, to provide official protection, and to assume the inevitable risks. Railways, shipping, arsenals, foundries, silk filatures, cement and glass factories, coal and copper mines—almost every new industry—developed initially under government patronage if not under government ownership.

Even more important for industrial progress was the abolition by the state of feudal barriers to freedom of occupation and movement; the encouragement of foreign trade and contacts, and the creation of a national framework of government, finance, and communications. These architectural reforms provided a framework and a climate conducive to the growth of capitalist enterprise both large and small. Foreign markets bulked large, especially in the case of the rising silk industry, but the chief stimulus to manufacturing production came from the growing internal market, reinforced in the heavy industries by the building of the new army and navy.

After 1880 the industrial properties of the state were transferred largely to private ownership. Often this was done at bargain prices which laid the foundation for some of the great industrial fortunes of later decades. Thereafter the state retained close control over such strategic industries as iron and shipbuilding. More indirectly it guided general economic development through subsidies, tariffs, government banks, and close personal affiliations between the bureaucracy and the *zaibatsu* (the great financial combines). After 1890, however, Japanese industry developed primarily under private ownership and initiative within the general framework of national policy. With due allowance for state intervention and controls and for the pervasive influence of the family system, Japan adhered to private capitalism until the eve of World War II.

War and Industrial Development, 1893–1913.—Between 1893 and 1913 a marked impetus to industrial expansion was afforded by two wars, both of them limited in duration and crowned with victory (see Table 1).

The conflict with China (1894–1895) produced an inflationary boom in Japanese war industries, which carried over into later years under the stimulus of continuing arms expenditures. It also gave Japan the power and prestige to regain her tariff independence (new treaties were nego-

tiated with the Western powers, which rid her of the former 5 per cent limitation on her tariff) and won her an indemnity of £38,000,000 from China. Customs autonomy made possible more effective protection of her new industries; the Chinese indemnity provided her with a gold and sterling reserve with which she adopted the gold standard in 1897. Her public credit now solidly established, Japan proceeded to borrow heavily abroad during the next decade. The proceeds were used mainly to purchase arms, industrial equipment, and materials for further industrial and military expansion, which in turn carried her successfully through the war with Russia in 1904–1905.

Japanese industry now began to assume the basic patterns which were to characterize it for the next 25 years. One branch comprised the metallurgical, engineering, and other heavy industries. These were the industries essential to military strength. Yet they were especially difficult to establish in Japan because of their heavy capital requirements and advanced technology. Here the state assiduously fostered development, itself, for example, launching the big Yawata Iron Works in 1901. Government subsidies also built up the ship construction industry to the point where Japanese yards could turn out 60,000 to 70,000 tons of steam vessels per year after the Russo-Japanese War. In such fields, however, Japan's technical capabilities remained decidedly limited. All except the simplest types of machinery and equipment still had to be imported from abroad. Her deficiency in mineral resources also restricted the mining industry to small proportions except for the production of coal and copper. The output of pig iron reached 243,000 tons, and that of steel 255,000 tons, in 1913. But Japan still imported half of her requirements of the former, and two thirds of the latter.

It was not these protected, high-cost industries which accounted for the substantial growth in Japanese national income and wealth through these decades. This growth came about, first of all, through the expansion and technical improvement of agriculture, which still occupied over half of the working population. Food production, for example, probably increased as much as 40 per cent from 1894 to 1914. In addition, there was a rapid development of numerous industries producing textiles, foodstuffs, pottery, paper, and

other wares for the foreign and domestic market. With this growth and specialization of commodity production came a corresponding increase in the demand for transportation, trade, banking, and professional services. These, too, afforded added employment opportunities for Japan's expanding population.

Unlike the strategic industries, other manufacturing trades mushroomed with little direct assistance from the state. Some were factory industries like cotton spinning, glass, cement, and beer, organized on a fairly large scale with modern equipment and corporate finance. Others were small-scale trades producing textile fabrics, foodstuffs, pottery, wood products, and miscellaneous consumer goods. Many of the latter remained largely on a workshop basis, perhaps with the introduction of some modern equipment—for example, the power loom in weaving. In a number of fields the small plant was linked with a steadily widening market through merchant capitalists, banks, and factories. They supplied materials and credit, and outlets for the finished product. The strength and resilience of Japan's developing industrial system owed much to these myriads of small establishments, coordinated and controlled through a superstructure of large-scale trade and finance. By 1913, Japan boasted nearly 2,000,000 workers in manufacturing. More than half of them were in establishments with less than 10 employees. Over 40 per cent of them were in the textile industries alone.

Textiles thus were the pioneer in the industrial system of Japan, as they had been elsewhere. In this field machine techniques were readily assimilated, capital requirements were small, and at hand were a large market and a reservoir of traditional skills. Raw silk production nearly tripled from 1894 to 1914, as steady improvements in quality enlarged the demand for Japanese silk abroad. Cocoon raising now afforded supplementary employment to one in every three farm families. The cotton industry also increased tremendously after 1890. By 1914 Japanese spinners were equipped with 2,400,000 spindles, and yarn output had reached 1,700,000 bales. Already monopolizing the domestic market, Japanese cotton goods were now spreading steadily through the Far East. As in other countries beginning to be industrialized, in Japan the cotton industry first established its independence in coarse yarns and woven goods. Only later could it enter world competition in the market for finer yarns and fabrics.

Labor conditions in Japanese mining and manufacturing reproduced all the raw evils which had characterized the early stages of the Industrial Revolution in the West. Over half of all factory workers in 1913 were women, many of them young peasant girls from the farms. There were neither factory laws nor trade unions. Hours ran to 10 or 12 or more; accidents and disease took a heavy toll; and the slums and sweatshops of Osaka and Tokyo rivaled those of any city in the world. So high was the turnover of labor that employers had to resort to extensive recruiting in the countryside. Many factory workers, especially women, were housed in dormitories which afforded food, lodging, and a considerable measure of employer control. Despite lack of economic opportunity in Japan's overcrowded agriculture, labor entered the factory only with reluctance.

Industry's Coming of Age, 1914-1929.—

Through the decade before World War I armament and war expenditure imposed a heavy strain on Japan's financial capacity. Large-scale foreign borrowing fostered military and industrial development, but it also burdened the country with increasing debt obligations abroad, which brought growing difficulties in balancing international accounts.

Just as Japan seemed headed for a serious financial crisis, war broke out in Europe. Almost immediately a limitless opportunity developed for exports of Japanese manufactures. War orders poured in, European competitors disappeared from Far Eastern markets, and the merchant marine inherited a large share of the world's carrying trade. Exports built up large foreign credit balances, which were used to sustain a rapid inflation of credit and prices at home. Japanese manufacturing thus embarked on a period of unprecedented prosperity (see Table 2). Factory production increased fourfold in value from 1914 to 1919, while the paid-up capital and reserves of all industrial companies jumped from 944 to 3,264 million yen.

Table 2¹—GROWTH OF FACTORY INDUSTRY IN JAPAN PROPER, 1909-1938²

Statistics of electric motors exclude electric and gas industries; gross production values exclude publicly owned plants. ³ Estimated. ⁴ 1937.

This war boom had two consequences for Japanese industry. The first was a rapid growth in capacity, diversity, and technical maturity. Factories doubled both their employment and their motive capacity from 1914 to 1919. New engineering and chemical industries grew to substantial proportions for the first time. The cotton industry increased its power looms from 55,000 to 110,000, as it expanded the volume and range of fabrics produced for foreign consumption. Steel production passed the 500,000-ton mark; coal consumption rose by 35 per cent.

In 1919 came the postwar financial crisis, with its ensuing fall in prices and stagnation of trade. Now the second and less fortunate aspect of war inflation began to show itself. Many industries and banks found themselves with inflated capital values which could not be supported with the return to more normal conditions. To make matters worse, the authorities attempted to maintain an artificial structure of prices and exchange rates by liberal credit policies and by the use of foreign balances accumulated abroad during the wartime boom. To these circumstances was added the shattering earthquake of 1923. Through most of the postwar decade Japanese industry struggled against deflationary pressures and financial disorders, which culminated in a serious bank crisis in 1927. As a result, this period saw the disappearance of many small banks and industrial firms unable to weather the strain. It brought a pronounced trend toward combina-

tion and cartelization, which strengthened the position of the *zaibatsu*, the great trusts which led the movement. The decade of the 1920's was also the high point of liberal, parliamentary government in prewar Japan. Social issues, including the long-neglected problems of industrial labor, came to the fore. Trade unions began for the first time to assert their power in industries where they could gain a foothold. The first significant reforms were undertaken in the field of factory legislation. (See also sections on *Labor Relations*; *Development of the Modern State*.)

Despite the financial difficulties plaguing many Japanese industries—perhaps because of them—this was also a period of marked technological advance. While agriculture had now virtually ceased to grow, the manufacturing trades moved steadily ahead. Raw silk and cotton goods were still the mainstay of the export trade, and they also provided the major share of industrial employment and income. Raw silk output reached 42,300,000 kilograms in 1929, or three times the 1914 level. Japan now stood second only to the United States and Great Britain as a consumer of raw cotton, with 6,500,000 spindles and a yarn output of 2,800,000 bales.

More significant for the future of Japan was the growth in range and maturity of other, newer industries. The production of electric power and cement, for example, tripled from 1919 to 1929. Steel output had advanced to 2,000,000 tons; coal production was running over 30,000,000 tons a year. Manufacturing output as a whole nearly doubled in the course of the decade (see Table 3). The more advanced types of machinery and equipment still had to be imported, but Japan could now meet her own needs in a wide range of electrical products, industrial machinery, and vehicles.

at the same time increasing the urbanization of the population. Yet in many ways industry remained closely linked with the countryside. It drew its low-wage labor from the nation's overcrowded farms, and its whole structure bore the stamp of the traditional modes of social organization still deeply rooted in rural Japan.

Industries like steel, shipbuilding, and paper developed as highly mechanized, large-scale establishments affiliated with big banks and trading houses. Here modern technology dictated the large plant. In addition, the absence of a broad middle class with capital to invest favored a concentration of control in the hands of great trusts like Mitsui, Mitsubishi, and Sumitomo. Elsewhere the shortage of industrial capital, the lack of advanced skills, and the localized or diversified character of markets encouraged the survival of more than 1,000,000 small plants. Many of these were rural trades offering by-employment to hard-pressed peasant families. Others crowded the growing industrial cities. In 1930 establishments of less than five workers still provided one third of Japan's total manufacturing output and accounted for over half of all persons chiefly engaged in manufacturing activity.

No country has exhibited wider contrasts between large capitalistic enterprise on the one hand, and myriads of tiny workshops still operating largely on the traditional handicraft pattern on the other. Nor has industrialism anywhere produced wider disparities between the immense fortunes piled up by big industrial magnates and the meager living of the masses of workers, small entrepreneurs, and farmers.

Trade, Armament, and Industrial Expansion, 1930-1940.—The great depression of 1929-1932 fell with crushing impact on Japan. The drop in farm prices spread bankruptcy through

1935-38.....	582	466	950	835	189	227

¹ Source: For the years 1895-1930, indices prepared at Nagoya Commercial College and published in *Hompō Seisan Sūryō Shisū Soran, 1894-1931* (Nagoya 1933). Here these indices are shifted from a 1919 to a 1910-14 base and projected roughly to 1935-38 by means of the indices of the *Oriental Economist*.

By 1930 Japan stood at a midpoint in her transition to an industrial economy. National income and wealth had increased manifold, far outdistancing the growth of population. This had come about through the rapid accumulation of capital and technology, together with the steady redirection of labor and capital toward manufacturing and the services. Agriculture still provided the chief occupation of half of Japan's 29,600,000 workers. Farming and fishing, however, now contributed no more than 20 per cent of the national income, as compared with 35 per cent provided by industry and the balance by the service trades (transport, commerce, the professions, and others).

Japanese industry was thus moving toward a predominant place in the national economy and

the countryside, and the collapse of the United States silk market produced a crisis in the Japanese balance of payments. Deflationary pressures forced the depreciation of the yen in 1931, just as the Japanese Army struck in Manchuria. These two latter events set in motion a train of forces which were to dominate the ensuing decade and culminate in Japan's entrance into World War II.

The depreciation of the yen gave a sharp impetus to Japanese exports, especially exports of cotton and rayon textiles and other cheap consumer goods. Japan's total exports, which now consisted mostly of industrial products, increased tremendously, doubling in quantity from 1930 to 1936. In part, however, the gains from this trade boom were more specious than real, for the lowered value of the yen required that Japan ship a

larger quantity of goods abroad to purchase a given amount of food, raw materials, or machinery. The volume of imports from foreign countries and colonies increased only 38 per cent. With the notable exception of silk, however, the export industries grew rapidly in capacity and output. They also improved greatly the range and variety of goods shipped abroad. (See also section on *Trade*.)

The second stimulus to industrial recovery after 1931 came from the policy of internal deflation pursued by Japan's skillful finance minister, Korekiyo Takahashi. Government spending chiefly took the form of rising expenditures for war, armament, and Manchurian development; it was facilitated by low interest rates and by heavy borrowing from financial institutions. From 1930 to 1936 national expenditures rose from 1,558 to 2,282 million yen, nearly doubling the national debt in the meantime.

Deficit financing thus reinforced the stimulus afforded by the export boom, and Japanese industry forged rapidly ahead. Mining output in-

The metallurgical industries all expanded rapidly, in the process adopting new methods which raised output per worker by about 25 per cent. Steel ingot production increased from 2,300,000 tons in 1930 to 5,200,000 tons in 1936. In the machinery trades, whose output was valued at 1,609 million yen in the latter year, imports were now confined to advanced and specialized types. In fact, a flourishing export market was beginning to develop with the aid of capital investments in Manchuria and north China. Production of coal, cement, glass, and electricity reflected similar gains. The output of soda ash, caustic soda, dyestuffs, and other basic chemicals increased twofold and threefold, or even more. Throughout manufacturing there took place a general growth in the scale of industrial organization and also in the preponderance of the great firms and holding companies which had always dominated heavy industry.

The relative importance of factory industries (including all private plants of five or more workers) in 1936 is shown in Table 4. Metal-

creased 30 per cent from 1930 to 1936; manufacturing output, 63 per cent. Wage rates recovered only slowly from depression levels because of the pressure on the labor market exerted by the stagnation of Japanese agriculture and the mechanization of many industries. Business profits reached boom levels, however, and provided huge sums for the expansion and re-equipment of Japan's major industries.

The progress of different sectors of Japanese industry was nevertheless uneven. The textile trades, as well as other industries producing consumer goods for foreign or domestic markets, made substantial gains in their scale of production, equipment, and organization. For example, the adoption of high-draft ring spinning and of automatic power looms in the cotton industry increased output per worker severalfold in the decade before 1936. Especially noteworthy was the sudden growth of the rayon industry, in which production jumped from 16,662 tons in 1930 to 125,420 tons in 1936. The woolen industry likewise won a substantial foothold in foreign markets.

It was chiefly the machinery, metallurgical, and chemical industries, however, which grew rapidly under the stimulus of armament spending and industrial construction in Japan and the overseas territories. While consumer goods production rose 33 per cent from 1930 to 1936, the output of producer goods jumped 83 per cent.

lurgy, machinery, and chemicals now accounted for 1,122,000 of Japan's 2,876,000 factory workers. They furnished as much as 2,202 million of the 3,633 million yen of net product (value added by manufacture).

While the armament business, government tariffs, and subsidies had contributed heavily to the large output and high prices which now characterized these industries, their new importance reflected a trend toward industrial diversification long evident in Japan. This trend doubtless represented the natural course of Japan's economic development, now reinforced by the stagnation of agriculture and by the increasing resistance to Japanese textile exports abroad. In the 1930's, however, it was greatly accelerated, and twisted toward the military ends of armament and empire building. As a result, Japan's industrial capacity and her capacity for waging war were enlarged. The flush of industrial prosperity, however, brought comparatively little gain in the Japanese standard of living. The consumption of civilian goods just about kept pace with the growth of population.

By 1937 Japan had reached virtual full employment. A brake had to be applied unless serious financial difficulties were to be invited. Military expansion, once begun, however, was not to be stopped. The outbreak of war in China was the signal for increased armament and military expenditure.

Immediately two difficulties began to appear. Continuing imports of war materials on a large scale weakened the yen. This led to the imposition of drastic exchange controls which seriously impaired the textile and other civilian industries requiring materials from abroad. In the domestic field as well, the acceleration of war preparations began to cut into the requirements of the civilian economy. The government was thus forced to spread a network of controls over investment, the allocation of materials, wages, and prices. By 1940, Japan was already devoting 17 per cent of her gross national product to war purposes. When the Japanese Navy struck at Pearl Harbor, the groundwork had been laid for full-scale industrial mobilization.

Japanese Industry at War, 1941-1945.—Japan entered World War II with an impressive record of industrial preparation. During the previous decade she had created virtually from nothing her aircraft, motor vehicle, tank, aluminum, and machine tool industries. By 1941 she was producing annually 5,000 aircraft, 48,000 motor vehicles, and nearly 500,000 tons of steel shipping. Steel ingot production was running at 6,800,000 tons; coal at 55,600,000 tons. Electric generating capacity had doubled since 1931. Immense stockpiles of equipment and raw materials, including a two-year reserve of oil, had been accumulated. Feeding the home industries of the Japanese islands were the controlled resources of Manchuria and north China. These were now developed to the point where they furnished a major part of Japan's requirements of iron, coking coal, salt, and certain other minerals.

With all these gains Japan still possessed hardly 10 per cent of the industrial potential of the United States. Moreover, she remained basically dependent on overseas supplies of oil, rubber, iron, bauxite, tin, and other strategic metals. The decision to strike at Pearl Harbor was therefore a desperate gamble on a war of limited liabilities. By seizing the rich regions of Southeast Asia and by establishing a defensive perimeter, Japan's military leaders hoped to win the resources with which to hold out until war weariness in the United States or a favorable turn in the international situation should enable her to retain significant gains.

This Japanese war plan may explain the lack of decisive measures to increase industrial capacity and production during the first year of hostilities. Not until the military reverses of late 1942 was industrial mobilization placed in high gear. Emergency controls were tightened under a Munitions Ministry established in 1943. Key industries—aircraft, shipping, coal, and metals—were singled out for concentrated effort. Direct outlays on war and munitions, which stood at only 31 per cent of the gross national product in 1942, were raised to 52 per cent in 1944. Some 9,500,000 persons were now engaged in factory industry and construction. This was 30 per cent of the nation's entire civilian labor force.

In the technical realm the war effort at its peak was impressive, especially in view of Japan's late entry into the industrial field. In 1944 aircraft production was raised to 26,364 planes, and over 2,000,000 tons of warships and steel merchant vessels were launched. Steel capacity was enlarged to 14,000,000 tons. Japanese fighter planes and other equipment proved the equal of those of any other country in many aspects of design and performance.

As early as 1943, however, the inherent weaknesses of Japan's industrial war effort were becoming evident. Its scale was necessarily limited by the meager Japanese standard of living, which could not be sharply reduced without impairing civilian efficiency and morale. Yet consumer expenditures in 1944 dropped 30 per cent from the 1940 level. Meanwhile, the lack of a large reserve of skilled workers created acute bottlenecks in essential industries. Overhead direction of industrial mobilization was crippled throughout the war by diffusion of responsibility. Sharp conflicts prevailed among separate ministries and between the government and business interests. Most importantly, Japan's basic vulnerability to sea blockade began to manifest itself in 1943, as Allied attacks on Japanese shipping began to cut off the inflow of strategic materials.

Peak production of finished military products was not reached until late in 1944. Already, however, the basic industries had begun to decline. Supplies of oil, aluminum, iron, and coal dwindled as submarine and air blockade progressively closed off the southern regions, and then even north China and Manchuria. Both imports and stocks of crude oil were virtually eliminated by the last quarter of 1944. Finished steel production had dropped 50 per cent. In short, Japan's war economy was crumbling at its foundations.

In the spring of 1945 came devastating air attacks on the home islands. These destroyed 40 per cent of the area of 66 cities, making 30 per cent of the urban population homeless. By July 1945, industrial output had declined to 40 per cent of the 1944 peak, and the Japanese will to continue resistance was broken. The atomic bomb and the Soviet Union's entry into the war were the *coups de grâce* which brought surrender.

Postwar Industrial Recovery and Reform.—With the war ended, Japan faced formidable tasks of industrial reconstruction. Great industrial areas lay in ruins. Foreign trade was at a standstill. The colonies were gone. The merchant marine lay at the bottom of the ocean.

Still more serious was the cumulative effect of Japan's war effort in dislocating the structure of peacetime industry and trade. The defeated nation now found itself with a surplus of idle war plants. But its cotton textile industry—to cite one civilian industry—was reduced to 2,150,000 spindles. The remaining 10,000,000 spindles of its 1937 plant had been scrapped, damaged, or converted to war uses. Raw materials and food were urgently needed from abroad. Yet Japan had nothing with which to pay for them. To add to the demoralization, the country's finances were in a chaotic state. As a result of deficit spending by the government and other inflationary stimuli, wholesale prices rose tenfold during 1946 and 1947. Especially acute was the shortage of food in the cities. Operating at only 31 per cent of its 1934-1936 level in 1946, Japanese industry faced a painful uphill struggle (see Table 5).

The Allied authorities, during the first two years of the occupation, were more concerned with Japan's disarmament and democratic reform than with industrial recovery. An interim reparations program was drawn up and approved by the Far Eastern Commission in 1946. It called for the removal from Japan of industrial plant capacity in excess of the nation's peacetime needs,

and its distribution among the Allies as compensation for war damage. Meanwhile, two principal steps were taken by the supreme commander for the Allied powers to democratize the control and operation of Japanese industry: the government was directed to legalize and encourage trade unions and collective bargaining (see section on *Labor Relations*), and a determined attack was launched on the monopolistic structures of the great *zaibatsu* combines. This latter undertaking was to achieve only limited results, owing to its inherent complexity and the lack of positive support in Japan. The leading *zaibatsu* families were largely shorn of their wealth and power; many nuclear companies at the center of the combines were dissolved or deconcentrated; and lateral ties among the remainder were weakened by the temporary purge of business executives and by restrictions on intercorporate shareholdings and interlocking management. By 1951, however, new business blocs were beginning to re-form around the big banks. An antimonopoly law, patterned on United States antitrust laws and forced through the Diet in 1947, was emasculated by amendments in 1949 and 1953.

Industrial recovery proceeded only slowly through the early occupation years. Except for emergency imports of food and essential materials, the Allied authorities placed responsibility for economic rehabilitation mainly on the Japanese government. But successive Cabinets proved themselves weak and dilatory in acting to restore the economy to solvency. By 1948 exports were still hardly 10 per cent of their prewar volume. Now the argument for more decisive stabilization measures was reinforced by growing international tension in the Far East, which highlighted Japan's weakness. Accordingly, the United States government took the lead in re-examining the reparations issue, and removals of industrial equipment for this purpose were discontinued in 1949, before they had gone beyond the token stage. At the same time, the Japanese government was required to balance its budget, and to tighten controls over prices, credit, and wages. With inflation stopped, the economy quickly began to show greater strength and stability. The outbreak of the Korean War in June 1950 gave a new stimulus to industrial production. Again, however, powerful inflationary pressures were revived, and soon created fresh difficulties in the export field.

By 1953 Japanese industry was producing 50 per cent more than in 1934–1936. On the surface this was an impressive gain. Yet the prospect was clouded by one grave weakness—the lagging recovery of exports. Industrial revival (see Table 5) had been built on a level of imports which far outran exports and were financed only

by huge expenditures of United States government funds in Japan (see section on *Trade*). Some of Japan's export difficulties lay abroad beyond her control. But her export industries were also handicapped at home by ineffectual controls over inflation, which raised costs and diverted resources to other uses. Although capital investment was at high levels, too little was going into the replacement of inefficient, obsolete equipment in export trades whose competitive strength in world markets was still weak.

As the postwar decade drew to a close, it appeared that Japan had yet to resolve the basic issue of how she was to prosper in the changed postwar world. With her population approaching 90 million, she depended more than ever on her industrial economy. A people of such enterprise and skills might be expected to resume the search for economic opportunity through building on a still larger scale one of the great workshops of the world. How well they would succeed depended on whether they could gain ever wider access to overseas materials and markets.

7. TRADE. This section treats the trade of Japan as it developed in (1) the domestic market, (2) the foreign market before World War II, and (3) in war and defeat.

Growth of the Japanese Market.—Japan's economic development in modern times illustrates Adam Smith's famous dictum that division of labor, the key to industrialization, is limited by the extent of the market.

During the Tokugawa shogunate (1603–1867), Japan's once flourishing maritime trade in the China seas was interdicted by the country's military dictatorship. For more than 200 years the nation was walled off from all but the most meager contacts with the outside world. In 1637 the authorities decreed that no Japanese might leave the country and return on pain of death. Seclusion was reinforced by a ban on the building of any ship with a capacity of more than 50 tons.

Internal commerce was also cramped and confined by political regulations, lack of transport, and the general self-sufficiency of preindustrial, peasant life. As late as 1868 there were virtually no highways in Japan worthy of the name. Nor were there even many wheeled vehicles of any description. The cost of transporting rice by land doubled its price in 10 to 20 miles or less. Bulk cargoes went chiefly by sea, but the 600-mile passage by junk from Tokyo to Kyushu was a hazardous one consuming a month or more. Trade was further limited by many toll barriers and by various restrictions on occupation, residence, dress, and the like.

In the latter half of the Tokugawa period

there appeared, it is true, a quickening of commercial activity and a rise of specialized handicraft production for local or interregional exchange. This growth of merchant capitalism, indeed, had much to do with the decay of the old semifeudal regime and its overthrow in the 19th century. Only with the reorganization of political power and the abolition of multifarious restraints on trade could the new forces of capitalism and nationalism find full expression.

The Meiji Restoration in 1868 ushered in a period of intensive modernization under the new national government. The remnants of feudal political organization with its semiautonomous territorial clans were abolished in favor of a centralized nation-state. The country was thrown open to a flood of Western influences. Within Japan the new government proceeded to establish a national system of taxation, banking, and currency; the beginnings of universal, primary education; a modern code of commercial law; new warehouses and commodity exchanges facilitating trade; a national network of posts and telegraphs; and, not least in importance, an expanding system of railways, shipping, and trunk highways.

One contribution of the state to economic modernization was its early encouragement of foreign trade, especially imports of machinery and equipment. Its most signal contribution, however, was to create and maintain a framework for a unified national market through such measures as those indicated above. Together these developments afforded the basis for a rapid expansion of Japan's productive power in subsequent decades and for a corresponding growth of commerce.

This structural framework for national economic development was not, of course, built overnight. By the turn of the century, however, the foundations had been laid. Between 1897 and 1927 railway freight traffic rose from 8,600,000 to 101,000,000 tons; shipping cargoes entered and cleared in coastwise trade reached 93,000,000 tons; and the number of animal-drawn carts licensed to haul goods multiplied fourfold. The index of the physical volume of imports from foreign countries (1913=100) meanwhile advanced from 45 to 200; the export index, from 32 to 175. These figures point to a tremendous increase in the exchange of goods and services produced for the market.

The expansion of Japanese commercial activity had two aspects. First, it reflected, and made possible, a steady growth in per capita production of agricultural and industrial products and services. This resulted from the introduction of capitalistic forms of production, especially in nonagricultural pursuits. Substantial gains in output per worker came about through the application of science, machinery, and modern business forms. At the same time population increased rapidly, rising from 38,000,000 to 69,000,000 between 1885 and 1935.

To what extent population growth actually expanded the national market is conjectural. It enlarged the demand for basic necessities like rice and cotton clothing, but it also restricted the market for other imported and domestic manufactures by limiting the advance of per capita output and levels of living. By any Western standard the Japanese internal market remained strikingly poor, mainly because of the severe pressure of population, accentuated by large expenditures on

armament, colonies, and strategic industries. Nevertheless, from available evidence it would appear that Japan's total national income and production at least quadrupled from 1885 to 1935.

In the second place, as an essential condition of this economic growth, production was increasingly commercialized for sale in the market. The old localized household and village economy of traditional Japan lingered on, especially in the more remote countryside. More and more, however, it gave way to a complex specialization of occupations, of regions, and of production processes, all tied together in expanding circuits of exchange. Some of these circuits represented primarily the exchange of goods and services in the domestic market; others involved wholly or in part the import of materials and equipment from abroad, paid for through exports.

The result was a pervasive spread of a money economy. The population of Japan's swarming cities naturally supplied most of their requirements through purchasing goods and services on the market. And by 1935 one in every three Japanese lived in a city of 30,000 or more. Even the Japanese farmer had come by this time to provide for two thirds of his family consumption of goods by purchasing them with cash income. The creation of capital goods, now a significant share of the national product, also meant production for the market, except as the farmer, the petty merchant, or the industrialist used his own labor to improve his land, buildings, and tools.

Both the specialization and expansion of production, then—two interlocking processes—steadily enlarged the sphere of market organization and the volume of exchange transactions in modern Japan.

While this widening of markets is commonly recognized as a necessary feature of Japanese industrialization during the past century, it is often thought of primarily in terms of overseas trade. Attention is centered on the rapid growth of the foreign market for Japan's major industries, with the implication that the home market failed to develop *pari passu*—indeed, was of little significance in industrialization. This is a gross misinterpretation of the historical facts, which fails entirely to account for the substance and momentum of Japan's economic modernization.

It is true that foreign trade has played a peculiarly important role in Japanese development since 1868. No country has been more suddenly transformed through contact with the outside world, or has built up a large complex of industry more dependent on those contacts. The nature of this dependence and its extent are examined below.

Before turning to foreign trade, however, it is important to place it in its proper perspective in Japanese economic life. Throughout the modern period the commerce of Japan has been predominantly the exchange of goods and services *within* the country. The home market has far outweighed the foreign market.

Except for shipping and certain financial operations, this is necessarily true of most services produced in any economy—the movement of goods and people and various private and public professional services, which are by nature non-exportable. Together they accounted in Japan for 20 to 30 per cent of all gainful employment and 50 per cent or more of all income produced

between World Wars I and II. The production of farm commodities, which probably doubled in the half century ending in 1935, was likewise geared almost wholly to the domestic market, with the conspicuous exception of sericulture. Certain sectors of Japanese industry were heavily oriented toward foreign trade; others, not at all. Japanese manufacturing as a whole (eliminating double counting of items) disposed of no less than 65 to 75 per cent of its product at home toward the end of this period.

The relative magnitude of Japan's foreign and domestic market is best expressed for the entire economy by the ratio between (1) the value of merchandise exports to foreign countries and colonies, and (2) the total value of all goods and services produced in Japan. Throughout most of the period 1914-1938 this ratio averaged about 20 per cent. The relationship fluctuated from year to year; in 1930, for example, total exports (including those to Korea and Formosa) came to 1,828 million yen, while the national product was valued at about 10 billion yen. Over the 25-year period, however, both series appear to have maintained a fairly consistent ratio of 1:5. Nor would the inclusion of certain exported services materially alter the conclusion. Evidently the prewar Japanese economy as a whole expanded more or less in proportion to the growth of foreign trade after 1914.

Thus the spectacular rise of foreign trade described below should not be allowed to obscure the fact that it was part of a more general process of expansion characterizing all parts of the Japanese economy in varying degrees. Indeed, foreign trade could not have increased so rapidly without a concurrent growth of domestic production and purchasing power. Some imports were purchased every year to supply such export industries as cotton goods with raw materials and equipment. In effect they were re-exported. But the bulk of the imports of food, raw materials, and manufactures went into home consumption. In 1936, for example, total imports from foreign countries, Korea, and Formosa were valued at 3,599 million yen. Offsetting these imports were exports of similar types, or imported materials embodied in export manufactures, amounting to about 1,100 million yen. The balance of imports, 70 per cent of the total, may be said to have been retained (net) for domestic use.

Foreign Trade of Prewar Japan.—While the growth of Japan's foreign commerce after 1868 was only one phase of her general development, it played a peculiarly strategic role. In a real sense, the whole increase of Japanese national income and wealth in modern times was founded upon expanding contacts with the outside world. Equally, the extension of her political empire in Asia (and its collapse in World War II) was closely associated with the growth of foreign trade, the ambitions which it fostered, and the dependence which it created.

During the early decades of the Meiji period (1868-1912), Japan's foreign commerce was significant chiefly as a newly opened highway of communication over which all sorts of new stimuli and new knowledge flowed from the West into the once isolated country. Foreign trade and foreign traders brought in industrial machinery and equipment, ships and munitions, and Western textiles and other consumer goods, as well as new techniques of industrial and financial

organization. Through this channel, as well as through foreign travel and study, the Japanese began to import and to assimilate the industrial arts which were to revolutionize a large part of their traditional economic life in the next 75 years.

Soon the second potentiality of foreign trade for Japan commenced to assume growing proportions. Most of the basic natural resources necessary for modern industry were lacking in Japan—notably, iron ore, coking coal, petroleum, and other essential minerals. In addition, as her population grew, her agriculture was increasingly unable to provide food, cotton, and other agricultural raw materials to sustain her growing industries. With the steady progress of industrialization, Japan soon reached a degree of national dependence on overseas materials that was exceeded by few nations. By 1930 net imports (imports minus exports) from foreign countries, Korea, and Formosa furnished the following percentages of Japanese consumption: cereals, beans, potatoes (grain equivalent), 13 per cent; fats and oils, 41 per cent; nitrogen fertilizer materials, 20 per cent; hides and skins, 75 per cent; petroleum products, 79 per cent; iron and steel (iron content), 85 per cent; lead, zinc, tin, and aluminum, 70-100 per cent; cotton, wool, rayon pulp, and rubber, 100 per cent. With a few exceptions like raw cotton, these imports did not so much replace as supplement the growing output of Japan's own farms, forests, and mines.

Table 1 summarizes the growth and changing character of Japan's international trade (excluding trade with her colonies) over three decades. Several broad characteristics may be noted.

Imports and exports, valued at only 11 and 16 million yen, respectively, in 1868, both passed the 100-million yen mark on the eve of the Sino-Japanese War (1894-1895). During the next 20 years they increased threefold and fourfold. World War I brought further gains, which were carried over through the postwar decade. (See also section on *Industrial Development*.)

A fresh impetus was given by the depreciation of the yen in 1931. In the ensuing trade boom, between 1930 and 1936, exports advanced from 1,470 to 2,693 million yen; imports, from 1,546 to 2,764 million yen. Import prices rose more rapidly than export prices, so that the terms of exchange moved against Japan. By 1936, however, Japan was importing more than twice as much as in 1913 and exporting three to four times as much. Except in the years 1915-1918, imports exceeded exports in value throughout this period. The trade deficit was offset by net earnings on shipping and foreign investments, by capital and gold movements, and by other invisible items in the balance of payments.

The figures in Table 1 refer only to trade with foreign countries. In addition, Japan built up a large source of food supplies in Korea and Formosa, paying for them with manufactures sold in these protected empire markets. If this colonial exchange is included, total Japanese imports from overseas amounted to 3,599 million yen in 1936, and exports to 3,508 million yen.

The changing composition of Japan's exports over these decades reflected the world economy of the times and the growing capabilities of her industries. For 50 years raw silk (classified as a semimanufacture in Table 1) held the lead. Japanese silk early won a preponderant place in

Table 1—FOREIGN TRADE OF JAPAN PROPER, 1893-1936

³ Including Hong Kong, Kwantung Leased Territory, and (in 1936) Manchukuo.

the great American silk market. From 1920 to 1930 this single item furnished 36 per cent of Japan's total export trade. Its contribution toward payment of foreign products consumed in Japan was even more important than this figure would indicate, for, unlike cotton goods exports, no part of the proceeds of silk sales had to be used to recover the cost of imported materials used in the export industry.

When silk prices collapsed in 1930-1931 the yen fell drastically in value—from \$49 in U.S. currency in 1930 to \$.28 in 1932. This gave a sharp stimulus to exports of cotton textiles, which had been expanding steadily since 1900 in Far Eastern markets. Aided by technical improvements, and by currency depreciation unmatched by corresponding increases in wages and other costs, Japanese cotton goods and other cheap manufactures spread rapidly through world markets. By 1936 Japan had become the world's premier exporter of cotton piece goods, with shipments of 2,710,000,000 square yards valued at 473 million yen. Other leading exports were as follows (in millions of yen): raw silk, 393; rayon piece goods, 149; machinery, 139; pottery and glass, 74; canned foodstuffs, 71; and a wide variety of other textiles, toys, chemicals, metal wares, and wood products.

Industrialization brought equally striking changes in Japan's import trade. During the early decades her purchases abroad were distributed over a wide range of foodstuffs, industrial materials, machinery, and other Western manufactures. Increasingly, however, as Japanese industry gained in capacity and maturity, it ousted foreign manufactures from the domestic market. Imports of consumer manufactures were restricted by high Japanese tariffs: machinery imports became confined more and more to advanced and specialized types still purchased more

cheaply in the West. By 1913 cotton, metals, and other raw materials already constituted one half of Japan's total imports (see Table 1). Thereafter the principal growth took place in imports of these industrial materials, together with rice, sugar, and other foodstuffs secured from colonies and foreign countries. In 1936, at the peak of Japan's prewar trade boom, her chief purchases from foreign countries were as follows (in millions of yen): raw cotton, 850; iron and steel, 231; wool, 201; petroleum products, 183; machinery, automotive vehicles, and instruments, 156; fertilizer materials, 145; non-ferrous metals, 141; wood and wood products, 122; and rubber, 73.

These changes in the composition of Japanese foreign trade resulted in corresponding shifts in its distribution among the principal regions of the world, as shown in Table 1. Throughout the prewar period this trade preserved a dual character. On the one hand, Japan sold to the West (mainly to the United States) one major industrial material, raw silk, together with a variety of simple manufactures like pottery and toys. The latter, however, were heavily restricted by high tariffs which tended to rise as Japanese competition became more severe. In Asiatic markets, meanwhile, Japan came to occupy increasingly the typical position of the industrial supplier, selling cheap cotton and rayon goods, metal wares, and other manufactures in exchange for rice, beans, coal, oil, rubber, and numerous other raw materials. By 1936 half of her exports to foreign countries were being marketed in Asia—as much as 63 per cent, if exports to Korea and Formosa are included.

Nevertheless, Japan remained heavily dependent upon the West for some of her most vital imports and for markets where she could earn the foreign exchange to pay for them. Here

she continued to purchase essential machinery and vehicles, as well as large amounts of cotton, wool, oil, steel, and other basic materials. The United States, in particular, still played a major role in Japanese trade, taking more than one fifth of her exports and supplying nearly one third of her imports. Japan's trade and armament boom from 1931 to 1936 so swelled her purchases of American materials and equipment that by 1936 she was absorbing half of all United States exports to Asia—more than were sold in all of Latin America.

Japan's Trade in War and Defeat.—From the foregoing survey it is apparent that foreign trade played an indispensable role in Japan's rise as an industrial power. No country derived greater benefit from the fortunate circumstance that the world economy of 1880–1935 was an expanding economy organized on a fairly free and competitive basis. Especially important for Japan was the system of multilateral trading relations in which a nation could buy and sell according to its economic advantage, settling its credits in one region against its debits in another.

The spread of trade and exchange restrictions in the 1930's, and especially the sharp increase in tariffs and quotas directed specifically against Japanese goods, was an ominous portent of the future. In part, however, Japan could only blame herself if a sudden, sharp influx of her cheap manufactures into the national or colonial markets of industrial nations struggling with depression provoked defensive measures. In any case, these measures failed to prevent a great expansion of Japanese trade, which contrasted favorably with the relative stagnation of economic activity elsewhere.

Japan thus had a special stake in preserving a free world economy. As she became a great trading power, however, she was exposed to the insecurities of this world economy, with its booms, depressions, and currency disorders. More important in the eyes of her military leaders, she found herself heavily dependent on markets and materials controlled by the other great powers, particularly the United States and the British Commonwealth. This was unacceptable to the militarists. Their dreams of Japanese hegemony in the Western Pacific required for their fulfillment the creation of a great east Asian bloc securely under Japan's domination and capable of satisfying her economic requirements, at least insofar as the sinews of war were concerned. With the seizure of Manchuria in 1931, national policy was directed increasingly toward the realization of this aim.

From 1931 to 1936 Japan found it possible to expand her armaments and extend her conquest of China while simultaneously enjoying a boom in foreign trade throughout the world. The latter fed the former, as evidenced in the huge import of war materials from the United States. After 1936, however, Japanese resources were fully employed (see section on *Industrial Development*). Continued deficit financing of war industry and colonial development brought rising inflation and progressive dislocation of civilian production and trade. Total imports and exports continued at a high level from 1936 to 1939. The trade with occupied China, Formosa, and Korea even registered large increases. But trade with countries outside this yen bloc began to dwindle in the face of growing exchange difficulties. Imports were diverted sharply to oil,

steel, and other strategic materials, in which the yen bloc remained seriously deficient. By 1940 food purchases from all overseas sources had fallen by one quarter, and shipments of raw cotton and wool by one half. The crisis came the following year, when the United States, Great Britain, and the Netherlands, aroused by Japan's aggressive military actions, at last embargoed all trade with her, pending a political settlement.

In World War I, Japan remained a neutral in all but name, reaping large profits from the trading opportunities it afforded. In World War II she cast the die in favor of a desperate bid for empire in east Asia. The result in the end was to destroy the whole structure of foreign trade upon which she had built her economic life, and to leave her a defeated and impoverished nation surrounded by neighbors similarly impoverished by her gamble.

Japan's war economy possessed hardly 10 per cent of the potential of her principal antagonist, the United States. And it was fatally dependent on overseas shipments of critical war materials.

Manchuria and north China had been developed to supply an important part of the Japanese deficit in coking coal, iron, salt, and foodstuffs. But oil, bauxite, rubber, manganese, chrome, nickel, and a dozen other strategic items had still to be brought in from the distant southern regions now overrun by the Japanese armies. Almost immediately these exposed sea lanes to the south came under attack from Allied submarines and aircraft. As the attack gathered weight and momentum through 1942 and 1943, the Japanese merchant fleet began to suffer relentless attrition.

As early as 1943 the peak output of basic materials in Japan was passed, and thereafter production and stocks steadily dwindled. By the second half of 1944, imports of four essentials had declined to the following percentages of 1943 shipments: coking coal, 35 per cent; iron ore, 28 per cent; bauxite, 17 per cent; crude oil, 9 per cent. Imports of rice, sugar, and textile fibers also approached the vanishing point. Half of all military supplies shipped from Japan to armies in the field were lost at sea during 1945. By the end of the war only 1,400,000 gross tons remained of the 6,000,000 tons of steel ships of 100 gross tons and over with which Japan had entered the war, despite the construction of 4,100,000 tons in the meantime. The United States Strategic Bombing Survey concluded that by August 1945 the interdiction of overseas materials alone would have reduced war production in Japan to 50 or 60 per cent of the 1944 level, even without air attack directly on the home islands. The latter largely destroyed Japan's war economy twice over and finally demoralized the nation to the point of surrender.

The early postwar years witnessed the slow and painful rehabilitation of the Japanese economy (see section on *Industrial Development*). The Allied occupation authorities faced the immediate necessity of importing large quantities of food to meet the critical shortage in the cities, as well as raw materials to restock the empty pipelines of industry. Beyond this it was evident that no long-term reconstruction of a politically stable and economically viable Japan could take place without restoring her access to world markets and supplies. Yet her ability to pay for imports was virtually nonexistent as the occupation began. Her export industries were greatly impaired in capacity and efficiency. Her

sheltered colonial market had disappeared. And elsewhere her structure of prewar trading relationships lay in ruins.

The revival of Japanese industry was closely correlated with the revival of the import trade which furnished its principal materials. By 1948 imports still totaled only 18 per cent of their 1934-1936 volume. Thereafter they rose year by year, reaching 48 per cent in 1951 and about 75 per cent in 1953. Half of their total value in 1953 was divided about equally between textile fibers (mainly cotton) and foodstuffs. The remainder consisted of machinery, fertilizers, coal, oil, and other industrial materials. The United States and Asia each supplied about one third of the total.

The crucial weakness of Japan's postwar recovery was the fact that even at this reduced level of imports she was living well beyond her means. United States government funds paid for 62 per cent of Japanese imports from September 1945 to June 1950. Some \$1,800 million was devoted to the purpose. Thereafter such aid was rapidly tapered off, and it ended in 1952. This was possible, without economic collapse, only because the Korean War brought a stream of dollars to Japan in the form of procurement contracts and troop spending. Meanwhile, commercial exports continued to lag far behind imports. While they rose steeply in 1949 and 1950, they were still only 35 per cent of their 1934-1936 volume in 1953. In that year they amounted to only \$1,275 million, as against imports of \$2,410 million. This huge gap was largely covered by \$809 million of United States offshore procurement payments and troop spending in Japan. Even then the remaining deficit reduced foreign exchange reserves to dangerously low levels.

These subsidies and windfall gains could not be expected to continue. The Japanese thus faced the necessity in 1954 of finding new export outlets on a large scale or of drastically reducing their standard of living. The silk trade, so long the mainstay of the economy, had now almost disappeared. Although Japan led the world in cotton goods exports in 1953, her shipments ran to only 914,000,000 square yards, as compared with 2,710,000,000 square yards in 1936. Exports to Asia nearly balanced imports and, as in 1936, comprised half the total. In volume, however, they were much reduced, especially because of the decline in sales to Korea and Formosa, and the virtual disappearance of the mainland China trade. The general imbalance in the commodity accounts was especially acute in trade with the United States and other dollar areas. Here receipts fell short of payments by \$538 million in 1953.

Japan's unsolved trade problem was twofold. In the sharpening competition for world markets she could hardly hope to meet her needs unless she cut her nonessential imports to the bone, curbed inflationary tendencies at home, and increased the efficiency of her export industries. Even this would be inadequate, however, unless progress could be made in stabilizing the Far East and in restoring a freer structure of world trade. Though loyally abiding by the United Nations embargo on shipping strategic materials to Communist China, many Japanese felt that their future was hopeless without access to Chinese markets and raw materials. Moreover, the opportunities required by Japan if she was again to prosper depended on the reconstruction of an international economy based on a durable peace.

8. LABOR RELATIONS. Although the Japanese labor movement dates back to the 19th century, it did not become a strong force in Japanese society until after Japan's surrender to the Allied powers in 1945. The postwar labor movement was nevertheless conditioned by its past.

During the late 19th and early 20th centuries Japan was rapidly industrialized under the aegis of a government modern in form but still largely feudal in spirit. In this process a large industrial proletariat was created. By 1930, 36 per cent of the gainfully occupied population was engaged in commerce and industry as against 51 per cent in agriculture and fisheries. Before World War II, however, the industrial working class, despite its large numbers, played on the whole a passive role in the economic, social, and political life of the nation.

There were several reasons for this situation, one basic reason being economic. Owing to the rapid increase in population and the limited supply of arable land, Japanese industry, despite its steady expansion, was never able to absorb all the surplus labor of the countryside. Since the supply of labor always exceeded the demand, labor's economic bargaining power was weak. This condition, which is paralleled in other Asiatic countries and which still exists, helps to explain why Japanese labor has sought to improve its status through political as well as through economic action. The structure of Japanese industry also militated against successful efforts at labor organization. A few huge, semimonopolistic family concerns (the *zaibatsu*) dominated industry and trade, while at the other end of the scale were thousands of tiny workshops employing less than five workers; medium-sized enterprises were relatively few in number. Hence labor unions found that most employing establishments were either too big to challenge with success, or too small to organize effectively. Wages remained low, and although the 20th century saw a gradual increase in real wages and in workers' living standards, this was not commensurate with the increase in national income.

Another reason for labor's passivity was social. Habits of thought and action derived from the feudal period, when carried over into modern industry, resulted in a high degree of paternalism. According to prevailing concepts, the proper relationship between employer and employee was one of mutual loyalty resembling the relationship between a feudal lord and his faithful retainers. The employee was expected to obey his employer dutifully and to accept his guidance not only on the job, but also in moral and political affairs; in return, the employer accepted an obligation to provide for the welfare of his employees. While this ideal pattern was not always realized in practice, it did something to mitigate the social evils which usually accompany the growth of industrialism. It also discouraged individual initi-

ative on the part of employees and the formation of group loyalties conflicting with the older concept of loyalty to persons. The strongly entrenched family system played a similar role as a focus for loyalties which in a more individualistic society might have attached themselves to trade unions or to the working class as a whole, and as a cushion against the evils of industrialism. A man who lost his job, or who could not live on his earnings in the city, could usually return to his native village and eke out a living with the aid of his relatives. Thus for many workers the family system provided a refuge which, however unsatisfactory, was safer and surer than the problematical gains of organizing to better their condition.

The principal obstacle to the growth of labor organization, however, was the attitude of the government, a narrowly based oligarchy essentially authoritarian in character. Aiming at national greatness rather than at national welfare, Japan's rulers sought to indoctrinate the masses with unquestioning loyalty to the state and sternly discouraged all movements of a popular or democratic nature. Trade unions were regarded as suspicious, if not subversive, and attempts to organize a union were made punishable by imprisonment under a law enacted in 1900. While this law was not always strictly enforced in later years, other laws, notably the Peace Preservation Law of 1925, rigidly circumscribed labor's activities and conferred broad powers on the police. Trade unions were kept under close surveillance; many strikes were broken by police action, unions were dissolved, and labor leaders were imprisoned. During the 1920's some attempts were made to set up impartial machinery for adjusting labor disputes, but they were not very successful and jurisdiction over labor affairs remained largely in the hands of the police.

This state of affairs led many labor leaders to conclude that improvement of the condition of labor required political action. Some thought in terms of democratic reforms which would make it possible to mobilize the voting strength of the masses by constitutional means. Others, who believed that a regime founded on force could be moved only by force, advocated direct action for revolutionary goals. Still others felt that labor could gain most by accepting the existing regime and cooperating with the authorities. Western social philosophies, such as social democracy, syndicalism, and communism, as well as the official doctrines of nationalism and the "way of the emperor," competed for allegiance among the intellectuals who provided most of the leadership for labor organizations. As a result, constant factional conflict seriously weakened the labor movement.

Development of the Labor Movement to 1945.—Feudal Japan had developed a number of craft guilds of skilled artisans, but these gradually disappeared with the growth of factory industry. As in other countries, the modern labor movement in Japan began with spontaneous demonstrations by small groups of workers in protest against specific grievances, with little thought of permanent organization. Such small-scale protests are recorded as early as the 1870's. Perhaps the first large dispute occurred in 1883, when the ricksha men of Tokyo went on strike in protest against the introduction of streetcars. Their organization was short lived, as were others formed in the next few years in other

trades. In 1897 a Society for the Formation of Trade Unions (Rodo-kumiai Kisei-kai) was organized by several Japanese who had lived in the United States and had studied the operations of the American Federation of Labor. Some progress was made among ironworkers, printers, lithographers, carpenters, dollmakers, and other groups, notably locomotive engineers, who conducted a well-organized and successful strike in 1898, led by the well-known Socialist, Sen Katayama (who later became a Communist). Following the Public Peace Police Law of 1900, however, these unions were stamped out, and no further attempts at open and systematic labor organization occurred until 1912. Nevertheless, several large strikes took place, notably those at the Ashio copper and Bessho silver mines in 1907, which were suppressed by military force.

In 1912, Bunji Suzuki founded the Yuai-kai (Friendly Love Society), whose purpose was to advance the interests of workmen by moderate and lawful methods of education, mutual aid, and cooperation between labor and management. This movement was tolerated by the authorities and made some headway, but was soon caught up in the wave of labor unrest during and immediately after World War I. This was a period of great industrial expansion which provided relatively favorable conditions for trade union growth. Business prospered, but labor often suffered when wages failed to keep pace with the rising cost of living. Many strikes occurred, reaching a peak in 1919, with 497 strikes involving 63,000 workers. One dispute alone, at the Kawasaki dockyards, involved 15,000 employees and was successful in winning an eight hour day. The great rice riots of 1918 also testified to a rising tide of discontent among urban workers. The cautious moderation of the Yuai-kai was challenged by other organizations with a more militant program, and in 1921 the Yuai-kai reorganized on modern trade union lines, taking the name of Nippon Rodo Sodomei (Japanese Federation of Labor).

The 1920's were a relatively liberal period in Japan, during which military influence was subordinated to civilian, and progress was made toward the development of true parliamentary government. Japan cooperated with the League of Nations and the International Labor Organization (ILO) and was on the whole receptive to currents of Western liberal thought. The appointment in 1924 of Bunji Suzuki, a trade union nominee, as the Japanese workers' representative to the ILO amounted to recognition by the government of labor unions as legitimate organizations. They were still viewed with suspicion, however, and militant action or radical views were sternly dealt with. Under the Peace Preservation Law of 1925 thousands of labor leaders, including a few Communists, were arrested. After the invasion of Manchuria in 1931 military control over the government grew steadily stronger and the nation moved toward a war footing, with almost complete regimentation of economic and political life. Repression of labor activities became increasingly severe, culminating in 1940 with the extinction of independent trade unionism.

Many labor disputes occurred in this period, their number fluctuating with changing economic and political conditions. From a low point during the postwar depression the number of disputes rose to a peak of 2,456 in 1931, when they

involved 154,000 workers, according to official figures. Of these, 998 disputes, involving 64,000 workers, were accompanied by a strike or other interruption of production. Following the Manchurian crisis the number of disputes declined, then rose to 2,126, involving 213,000 workers, in 1937. After the outbreak of the Sino-Japanese War in 1937, labor disputes decreased rapidly; only 330 occurred in 1941. Many of these disputes were small affairs, precipitated by local grievances, sometimes without previous union organization. Large, organized strikes were comparatively rare, although some occurred, notably the great seamen's strike of 1928, which won Japan's first minimum wage agreement, and the strike which broke out in 1930 in the Kane-gafuchi cotton mills despite highly paternalistic conditions. In these conflicts with management, labor's objectives were almost entirely economic, wages being the principal issue. Labor lost more strikes than it won, although many disputes were settled by compromise. Collective bargaining, as the term is understood in Western countries, hardly existed except in the strongly organized shipping industry.

Although labor victories were few, trade union membership increased steadily from 103,000 in 1921 to 420,000 in 1936, but this peak figure represented only 6.9 per cent of all nonagricultural workers. Seamen were the most highly organized group (about 90 per cent), followed by municipal transit workers. In factory industry labor organization was weak except in certain sectors of metals, machinery, chemicals, and communications. Japan's leading industry, textiles, where much of the labor force consisted of young girls living in company dormitories, remained almost entirely unorganized.

Owing to conflicting views on ideology and tactics and to changing circumstances, labor organizations in this period appeared and disappeared, split and recombined, with great frequency. The principal Right-wing group was the Japanese Federation of Labor (JFL), which, after a short period of militancy under radical leadership in the early 1920's, pursued cautious and moderate policies, seeking gradual improvement of labor's condition by legal and orderly methods. Like other national federations, the JFL was rather loosely organized, with local affiliates enjoying considerable autonomy and often seceding from the parent body. Nevertheless, the JFL preserved its identity throughout the period as the leading Japanese labor organization. Even stronger in its own field was the Japan Seamen's Union (Nippon Kain-kumiai), a highly conservative group which enjoyed the patronage of both the shipowners and the government. In the 1930's these and other Right-wing groups were loosely linked in the Japanese Trade Union Congress (Nippon Rodo-kumiai Kaigi), which served chiefly as a vehicle for consultation on matters of general policy. On the extreme Right, the 1930's saw the emergence of a fascist labor group, the National Convention of Patriotic Labor Unions (Aikoku Rodo-kumiai Zenkoku Konwa-kai).

During World War I, Japanese Left-wing thought was influenced chiefly by anarchosyndicalism. Later, socialism of various brands gained ascendancy, while after the Russian Revolution communism won converts on the extreme Left. In 1925 a Leftist group seceded from the JFL and formed the Council of Japanese Labor

Unions (Nippon Rodo-kumiai Hyogi-kai), which, after leading a number of strikes, was dissolved by the government in 1928. Its successor, the National Congress of Japanese Labor Unions (Nippon Rodo-kumiai Zenkoku Kyogi-kai), reputedly under Communist influence, continued to carry on some underground activity. Another group, which held radical views, but sought to operate within the law—the so-called legal Left—was organized in 1930, and in 1934 took the name of National Council of Japanese Labor Unions (Nippon Rodo-kumiai Zenkoku Hyogi-kai). This body was dissolved by the government in December 1937, and its leaders were arrested.

In addition, there were a number of small centrist organizations, notably the National League of Labor Unions (Zenkoku Rodo-kumiai Domei), formed in 1930 by several groups which had split off from the JFL. Inclining more to the Right than to the Left, the center groups made several unsuccessful attempts to bring about some measure of unity in the labor movement.

Prior to 1925 it was hardly possible for ordinary citizens to exert any political influence except by humble appeals to the authorities or by direct action. The introduction of universal manhood suffrage in 1925 provided an impetus for the formation of farmer-labor parties, usually sponsored by existing labor and peasant unions; leadership of parties and unions was largely interchangeable. The Left-wing parties suffered from the same schismatic tendencies as the labor unions, as well as from the attentions of the police. Nevertheless, the proletarian parties made considerable progress in the decade preceding the Sino-Japanese War, though they did not seriously challenge the electoral supremacy of the two older conservative parties, the Seiyukai and the Minseito.

A Social Democratic Party had been founded as early as 1901 by Isoo Abe, Sen Katayama, and others, but it was immediately suppressed, as was a Socialist League formed in 1920. A Communist Party was organized in 1922, but by 1929 most of its members were in jail.

The first Farmer-Labor Party (Nomin Rodoto) was organized in 1925 by the Japan Farmers' Union (Nippon Nomin-kumiai) and certain centrist trade unions, but it was immediately dissolved by the government. By 1928, however, when the first election with full suffrage was held, there were four proletarian parties, which polled 489,000 votes and elected 8 members to the lower house of the Diet (total membership, 466). The strongest of these, the Labor-Farmer Party (Rodo Nominto), was dissolved by the government after the election for alleged radical tendencies. In the ensuing decade the principal proletarian group was the Social Democratic Party (Shakai Minshuto), organized in 1926 by Bunji Suzuki, Isoo Abe, and others of moderate Socialist views; in 1932 it merged with other organizations to form the Social Mass Party (Shakai Taishuto). Both of these parties were closely linked to the JFL and the Japan Farmers' Union. In general they advocated mild reforms designed to introduce greater democracy in government and to improve the condition of peasants and industrial workers, such as reducing the powers of the House of Peers, the reduction of farm rents, and unemployment insurance. There were in addition various smaller parties linked with Left-wing farmer and labor organizations and

having somewhat more radical programs. In the election of April 1937, a few months before the outbreak of war with China, the proletarian parties polled nearly 1,000,000 votes (10 per cent of the total) and elected 37 candidates, doubling their Diet membership.

This increase in the Left-wing vote indicated a significant degree of popular dissatisfaction with the growing militarization of the Japanese government, which laid heavy burdens on the masses and restricted their freedom of action. Labor and farmer unions and parties, weak as they were, represented a divisive force in a Japan which, especially after passage of the National Mobilization Law of 1938, was moving ever closer to total regimentation for total war. Japan's leaders therefore sought to win over some of the mass organizations and suppress the rest. Appeals to patriotic sentiment were effectively used to combat unrest among the masses. After the Manchurian incident of 1931, and even more after the beginning of war with China in 1937, many Right-wing labor leaders espoused the doctrines of ultranationalism, whether from conviction or from expediency. Leaders who had earlier opposed imperialistic adventures, at least in principle, were now forced to change their views, keep silent, or go to jail.

Employers, in contrast to labor, were strongly organized in numerous trade associations, chambers of commerce, and local groups, which were concerned among other things with securing legislation favorable to employers' interests and with measures to combat the growth of trade unionism. Outstanding among the groups primarily concerned with labor relations were the Japan Industrial Club (Nippon Kogyo Kurabu) of Tokyo and the Osaka Industrial Society (Osaka Kogyo-kai). The first national employers' association was the National Federation of Industrial Organizations (Zenkoku Sangyo Dantai Rengokai), a powerful body formed in 1931 to oppose a pending trade union law. Employers sought to counteract labor unrest by fostering the spirit of paternalism in industry, and to head off the growth of independent trade unionism by organizing welfare associations or company unions among their own employees. In 1936 the company unions counted 1,347,000 members, or three times as many as the independent unions.

Somewhat similar in purpose was the Harmonization Society, organized in 1919 to promote harmony between capital and labor, and backed by the government and by representatives of big business. Early in the Sino-Japanese War, in 1938, this society launched the Industrial Patriotic League (Sangyo Hokoku Renmei) with the object of promoting cooperation between labor and capital to advance Japan's national aims. In 1940 this movement was taken over by the government, which formed the Industrial Patriotic Association (Sangyo Hokoku-kai, commonly abbreviated as Sampo). The Left-wing unions had been dissolved in 1937, and the remaining unions, voluntarily or otherwise, were absorbed into Sampo. In 1940 also, the Social Mass Party, along with all other political parties, voluntarily disbanded and merged into the Imperial Rule Assistance Association, Japan's state-sponsored totalitarian party, which worked closely with Sampo.

The purpose and functions of Sampo were roughly similar to those of the Nazi Labor Front in Germany. Branches were organized in every

industrial establishment having 50 or more workers. All employees were expected to join, and the owner or factory manager was usually the head of the association. By 1943, Sampo had 86,000 branches and approximately 6,000,000 members. It carried on intensive patriotic propaganda, organized various projects to aid the war effort and to promote industrial efficiency, and conducted certain welfare activities. As World War II progressed, more forceful measures were found necessary. Labor conscription was introduced in 1942, and in 1944 military discipline was applied to workers in war plants and mines. Meanwhile, the conditions of labor steadily deteriorated as a result of inflation, shortages of food and other commodities, longer working hours, and the bombing of Japanese cities. While labor unrest was kept well under control, several hundred small strikes were recorded during the war years.

Labor After World War II.—The years immediately following World War II provided, for the first time in Japanese history, a favorable climate for the growth of labor organization. Released from former restraints and aided by Allied occupation policies, the labor movement quickly revived and, for a time, made rapid progress. As before the war, its objectives were political as well as economic, and it was in constant factional turmoil. As time went on, the opposition stiffened, and various legal limitations were imposed on labor action.

In line with their policy of encouraging democratic tendencies in Japan, the Allied occupation authorities proclaimed, within broad limits, freedom of speech, press, and organization. Sampo was dissolved, old laws restricting labor activity were abrogated, the powers of the police were curbed, and political prisoners were released. On Oct. 11, 1945, Gen. Douglas MacArthur, supreme commander for the Allied powers (SCAP), publicly called on the Japanese government to encourage the unionization of labor. This policy was based on the belief that industrial labor could, with proper guidance, become a powerful force for democracy and a bulwark against political reaction. The occupation authorities sought to introduce into Japan a system of labor relations based, so far as possible, on the best United States practice. A new Trade Union law (1945) guaranteed the right of organization and collective bargaining, and a Labor Relations Adjustment Law (1946) set up machinery for peaceful settlement of labor disputes through conciliation, mediation, or arbitration by impartial committees (both laws were revised in 1949 to impose certain restrictions on unions). A Labor Standards Law (1947) and related legislation sought to fix minimum legal standards for wages and conditions of employment. A Labor Ministry was established in 1947.

Having set up this machinery, SCAP intended to let the Japanese operate it with a minimum of interference, but the inexperience of Japanese labor, employers, and government officials made it necessary for SCAP to give strong, though usually informal, guidance to all parties in important labor disputes. On several occasions, SCAP intervened openly to prohibit strikes which, it was feared, would disrupt the national economy. This reflected not only the gradual shift of emphasis in occupation policy from political reform to economic recovery, but also its opposition to communism, for Communists had been

active in organizing strikes. Similar motives lay behind SCAP's recommendations of July 1948, which resulted in revision of the civil service law to cancel or limit the rights of collective bargaining previously enjoyed by government employees.

The postwar labor movement was conditioned not only by occupation policies, but also by the economic and political situation in Japan. In the first postwar years production was stagnant; food, clothing, and other necessities were in extremely short supply; and prices mounted rapidly on a wave of inflation. To urban labor, which had suffered severe privations during the war, peace brought no improvement. Unemployment was widespread, although the paternalistic tradition against discharging workers counteracted in part the effects of business depression. Under such circumstances labor unrest was inevitable, and occupation policies gave it the opportunity of expression.

Labor's demands were addressed to the government as well as to employers. Many of the workers' early grievances—for example, an inefficient rationing system and inequitable income taxes—could be corrected only by government action. About one fourth of the nonagricultural labor force was employed directly by the government, which owned most of the railways, the communications systems, and several state monopolies. Other major industries were regulated or subsidized by the government, which could in effect determine their wage policies. In any case, it was obvious that no substantial improvement in labor's condition could be expected except through an overall program of national economic reconstruction, which the government was slow to undertake. Beyond this, democratization was the watchword of the day, and most labor leaders were dissatisfied with the rate of progress. The conservative parties, which largely dominated successive Cabinets, were reincarnations of prewar parties which had represented big business interests and were unsympathetic, if not hostile, to the claims of labor. Although many wage earners voted for conservative candidates, most leaders of organized labor rejected them, dividing their support among the parties of the Left or taking an independent Left-wing stand.

The young postwar unions suffered from a lack of experienced leaders, which often led to ill-considered or irresponsible tactics. The millions of workers who swarmed into the unions, some with enthusiasm and some from the habit of conformity, had little knowledge of trade union methods or of elementary democratic procedures. Accustomed to submitting to superior authority, they tended to follow their leaders blindly, and the leaders in turn tended to expect unquestioning loyalty and obedience from their followers. On the other hand, competition within the leader group led to heated and sometimes violent debates, which made it difficult for any small group at the top to impose its views. Nevertheless, dictatorial control by political fanatics or ambitious careerists was a constant danger. Another danger was that of falling under the control of employers. "Puppet" or company unions, well known in prewar Japan, were a favorite tactic of employers in combating independent trade unionism.

Organization was strongest in the large-scale industries, leaving Japan's many small-scale industries almost untouched. Most unions were

organized on a plant or company basis, embracing both white-collar and manual workers. Such units tended to be oriented toward their own individual enterprises, which often had a divisive effect upon the labor movement as a whole. Nevertheless, many of the local units soon combined to form national industrial unions and then federations. Two national federations were organized in 1946: on the Right the Japanese Federation of Labor (known as Sodomei; later called the General Federation of Japanese Trade Unions), a revival of the prewar organization of the same name; and on the Left the new National Congress of Industrial Unions (known as Sanbetsu). There were also a smaller centrist federation, numerous independent national unions, many smaller groupings set up on a local, company-wide, or other basis, and many unaffiliated local unions.

Social Democrats (Socialists) and Communists, competing keenly for labor support, took an active part in organizing the new unions. The Social Democrats, who sought to gain political power by constitutional means, tended to counsel moderate and legal tactics, while the Communists advocated more aggressive and militant methods, including use of the strike as a political weapon. Sodomei was controlled largely by the Social Democrats. When, in 1950, the party split into Left and Right wings, the Right wing retained control of the labor federation, but several unions later seceded. Sanbetsu was originally somewhat larger than Sodomei and much more loosely organized. The Communists made strenuous and partially successful efforts to bring it under their control; they played a dominant role in determining the policies of the national headquarters, but often failed to impose centralized control on the various affiliated unions.

In many labor disputes it was difficult to disentangle economic from political motives. The peak of direct action by labor came in January 1947, when a threatened strike of government employees in support of legitimate wage demands mushroomed until it approached the proportions of a general strike to force the resignation of Shigeru Yoshida's first Cabinet. This mass movement, which was partly but not wholly of Communist inspiration, reflected a protest against economic hardship and also a confused desire for political change, vaguely defined as "a Cabinet based on the Social Democratic Party." At the 11th hour the proposed strike was banned by order of SCAP. Later, the wage demands of the government employees were met in part, and a new election was held, which resulted in the formation of a coalition Cabinet headed by a Social Democrat. After this episode labor did not lose interest in politics, but shifted its efforts toward normal political channels. Many unions took an active part in election campaigns, generally supporting Social Democratic candidates. On various occasions, however, brief but widespread strikes were called in protest against legislation regarded as prejudicial to labor.

After the abortive strike in January 1947 factional struggles became more intense within Sanbetsu and many independent unions. These frequently took the form of a three-way conflict among Communist sympathizers, conservatives, and a third group which was militant but anti-Communist. In 1947-1948, with SCAP encouragement, democratization leagues were organized within many unions to combat Communist

influence, and by 1949 Sanbetsu had lost more than half of its membership. The decline of Communist influence was due partly to a revulsion against Communist tactics, partly to anti-Communist measures taken by SCAP and the Japanese government, and partly to the discharge by government and private employers, in 1949, of many known or suspected Communists. The outbreak of war in Korea in June 1950 led to intensified action by SCAP and the government to curb Communist activity. By the end of 1950, Sanbetsu had practically disappeared, and the newly formed General Council of Japanese Trade Unions (Sohyo), under anti-Communist (chiefly Left Socialist) leadership, had assumed the leading position in the labor movement. The Communists, now forced to operate largely underground, made vigorous efforts to recoup their losses, and by 1953 were said to have gained considerable influence in Sohyo. As a result several unions seceded from Sohyo and, in 1954, combined with Sodomei to form a new anti-Communist federation, Zenro.

Union membership reached its peak in March 1949, with 6,896,000 organized workers, of whom about one fourth were women. The total dropped in the next two years, then turned upward; in June 1953, it was 5,851,000, representing about 40 per cent of all nonagricultural labor. In 1953 Sohyo had 3,273,000 members (56 per cent of all organized labor), Sodomei 240,000, Sanbetsu 13,000, and Shinsanbetsu (an anti-Communist splinter group) 39,000. Zenro, formed in 1954, claimed 800,000 members including several former Sohyo unions. Among the major unions affiliated with Sohyo in 1954, with approximate membership, were the teachers (535,000), government railway workers (370,000), coal miners (270,000), local government employees (200,000), postal employees (160,000), iron and steel workers (125,000), private railway workers (120,000), telephone and telegraph workers (105,000), and United States garrison force employees (100,000). Zenro included, besides Sodomei, the textile workers (360,000) and seamen (100,000). There were also in 1953 about 30 independent national unions with 796,000 members; 856,000 in unions affiliated with local or minor groups; and 695,000 in unaffiliated locals.¹ Government and government enterprise employees were strongly organized with their own liaison council.

In the economic field, labor's principal demands were for higher wages and security of employment. Demands for wage increases were insistent, especially in 1946-1949, when prices were rising rapidly. Mass discharge of workers by government or private employers, in the interests of economy and rationalization, met with strong protests from organized labor. A demand often heard in the early postwar years was for democratization of management, an ill-defined term which sometimes meant union participation in determining company policies. In the first year or two after the war labor's claims met with little opposition. Later, the opposing forces recovered their self-confidence; employers offered stiff resistance to union demands, and the police took a stronger hand in labor affairs.

Although thousands and, at some periods, millions of workers were involved in labor disputes, the amount of time lost through strikes was not large; many disputes were settled peacefully,

and most strikes were short. Figures on work stoppages in 1946-1953 are as follows:

	Number of stoppages	Number of workers involved	Man-days lost	
			Number	Per cent of total worked
1946	702	517,415	6,266,255	.253
1947	464	218,832	6,035,783	.142
1948	744	2,304,492	6,995,332	.197
1949	554	1,122,123	4,320,688	.172
1950	584	763,453	5,486,059	.158
1951	576	1,162,585	6,014,512	.132
1952	590	1,623,610	15,075,269	.432
1953	585	1,173,958	4,222,026	.116

Nevertheless, strikes in key industries sometimes had adverse effects on the entire economy, which led to stronger regulatory legislation. Since SCAP discouraged large strikes as harmful to economic recovery, and strikes by government employees were eventually banned, many alternative methods of protest were devised, such as demonstrations, slowdowns, absenteeism, and brief walkouts. The machinery of peaceful settlement by impartial committees, backed at first by strong SCAP support and guidance, played a major role in the settlement of many disputes. Some progress was made in developing written contracts and other instruments of collective bargaining on Western models. Occasional violence appeared on the part of labor, and employers, but serious incidents were rare.

After Japan resumed full sovereignty on April 28, 1952, the government took a stronger line toward labor. Various regulatory laws were passed, and it was hard to draw a line between suppression of subversive activity, necessary regulation of labor affairs, and repression of legitimate union action. Employers also became more active in combating labor tendencies of which they disapproved. The labor unions were financially weak and were rent by factional and ideological strife, and Communist influence was by no means dead. By 1954 it could be said that, by comparison with prewar years, organized labor had achieved a position of considerable strength and standing in Japan, where it represented a substantial political minority group. Yet because of its own organizational weaknesses, together with the persistence of prewar social and economic patterns, the future of the labor movement was far from clear.

9. TRANSPORTATION AND COMMUNICATIONS. The development of transportation and communications systems in Japan has been conditioned by two basic factors. First, the fact that Japan is an insular country with a mountainous terrain and with most of its leading cities situated along the coasts has made coastal shipping important, has shaped the pattern of the railroads, and has retarded the development of highways. Second, the Japanese government has played a significant role in developing, supervising,

¹ These figures include some overlapping.

ing, and controlling virtually all means of transportation and communications. All forms of communications have always been operated either directly by the Japanese government or through government-controlled corporations; all forms of transportation have been regulated by the government, which has also operated directly most of the railroads and, since 1941, most domestic shipping. These two factors can be traced in the following sections, which discuss the development of Japanese railroads, domestic shipping, highways, air transportation, telephone and telegraph services, international communications, radio and television, and postal services.

TRANSPORTATION

Railroads.—Shortly after the Meiji Restoration of 1868, the government began to draw up plans for the building of a railroad to connect Tokyo with other Japanese cities. In 1869 plans were completed for a railroad linking Shimbashi in Tokyo with Yokohama, Kyoto, Kobe, and Tsuruga (Fukui Prefecture). Authorization was granted to construct the first part of the line between Tokyo and Yokohama, a distance of 18 miles; the cost of this project was estimated at about 500,000 yen. The Japanese government, however, was unable to raise this amount from domestic sources, and it therefore accepted the offer of H. N. Lay, an Englishman, to finance the project. A Japanese government loan of £913,000 was then floated in London. This financing not only represented Japan's first foreign loan, but also resulted in the initial use of British engineers and British railroad equipment in building Japanese railroads.

The line between Tokyo and Yokohama was completed in September 1872; it was followed in 1874 by a line between Kobe and Osaka (a distance of 20 miles), which was extended three years later to Kyoto. By 1889, two decades after the first plans for railroad construction had been made, the Japanese government had completed the Tokaido line between Tokyo and Kobe (a distance of 380 miles), and had virtually completed a branch line connecting Tsuruga with the Tokaido line in order to connect the Japan Sea with the Pacific Ocean by rail. In addition to these lines, 55 miles of railroad had been completed in Hokkaido to aid in the colonization of that island. Some private railroads were also built during this period with the aid of government subsidies.

Railroad development in Japan, however, did not advance as rapidly as the government thought necessary in the light of the development of other sectors of the country's economy, as well as of the strategic importance of an adequate railroad network. As a result, in 1892 the Diet passed the Railway Construction Law, which established a comprehensive railroad building program for 149 lines with a total length of 6,350 miles. The law also recommended that the government consolidate all rail lines into a unified state-owned system by purchasing private lines. The government embarked on its construction program, but it was not until 1907, after it had experienced difficulty in controlling the private lines during the Russo-Japanese War, that nationalization of the railroads took place. Of the 36 private lines with a total mileage of 3,248 miles then in existence, the government purchased the 17 most important lines, with a total mileage of 2,823 miles, leaving only minor local lines in private hands.

The government's railroad building program advanced steadily after 1907, and even private local railroad building increased. By 1953 the total length of main track in Japan amounted to 17,200 miles, of which 12,400 miles were government owned. Over 10 per cent of the electrified trackage in operation in 1953 had been built since 1945. The total mileage of Japanese railroads compared with the approximately 223,000 miles of first main track in the United States in 1953. It should be noted, however, that Japan had more trackage per unit-area than the United States, though less than England, France, or Germany.

Japan's railroad system closely reflects the shape and terrain of the country. Because the interior of the country is mountainous, the main lines generally follow the coasts, while the secondary lines cross the mountain chains to connect the east and west coast main lines. Since the most important Japanese cities are located on or near the coasts, they are directly connected by the main routes.

Only a few lines are of major importance. The oldest and most important is the Tokaido line between Tokyo and Kobe. The Sanyo line, which is a continuation of the Tokaido, connects Kobe with Shimonoseki at the western tip of Honshu. At Shimonoseki an undersea railroad tunnel to Moji connects the Sanyo line with the Kagoshima and Nippo lines, which run, respectively, along the west and east coasts of Kyushu. North of Tokyo the Tohoku and Ou lines connect the capital with Aomori in the northern part of Honshu. A railroad ferry connects the Tohoku and Ou lines with Hokkaido's Hakodate main line. The latter connects Hakodate with Asahigawa, which in turn is connected with Wakkanai at the northern tip of Hokkaido by the Soya line. Other important lines are the Sanin line between Kyoto and Shimonoseki along the northern coast of Honshu; the Chuo line, which connects Tokyo with Nagoya through the interior of Honshu; and the Takasaki, Joetsu, and Shinetsu lines, which connect Tokyo with Naoetsu and Niigata on the Japan Sea coast.

The nature of the Japanese terrain necessitated the construction of many tunnels, curves, bridges, retaining walls, and steep grades. In order to economize in the building of a railroad system that required these features, a narrow gauge of 3 feet 6 inches (1.067 meters) was adopted as the standard, compared with a railroad gauge of 4 feet 8½ inches in most other countries of the world. Because of the use of a narrow gauge, Japanese trains are slower and have a smaller carrying capacity than those of the United States and of most European countries. The rolling stock is small and light weight, and the trains have relatively few cars.

About 28 per cent of the railroad system was electrified by mid-1953; over three fourths of the electrified mileage was privately owned, being similar to suburban electrified passenger lines in the United States. Most of the mileage of Japanese railroads is single track. In mid-1953 the government-owned railroads had 5,066 steam and 402 electric locomotives, 11,625 passenger cars, 106,626 freight cars, and 2,710 electric cars. Employees on government and private railroads totaled 573,000, or 33.3 per mile, compared with 5.7 employees per mile in the United States. The number of employees on Japanese railroads in 1953, however, represented a significant re-

duction from the 753,000, or 40.5 per mile, at the beginning of 1948.

Before World War II the Japanese railroads carried only about 30 per cent of the tonnage of the country's domestic trade. Little of the rail tonnage required long hauls, and most of it moved between local ports and their hinterlands, longer shipments being made by coastwise shipping. Unlike the case with railroad systems in other countries, revenue from passenger traffic and passenger train mileage consistently exceeded revenue from freight and freight train mileage respectively.

During World War II the amount of freight carried on Japanese railroads increased significantly as ships that had been engaged in coastal trade were diverted to other routes, and gasoline, tires, and other automotive essentials were diverted from civilian to military needs. By 1943 the railroads reached their peak operations. In that year freight tonnage totaled 214,400,000 metric tons, and freight train kilometers totaled 42.1 billion. Passenger traffic amounted to 4.6 billion, and passenger train kilometers totaled 93 billion.

The heavy volume of wartime freight, the Allied bombings, and a lack of repair parts resulted in a marked deterioration of the Japanese railroad system by the end of the war, and the economic chaos that prevailed in Japan in the first two years after the surrender in 1945 prevented the early rehabilitation of the railroads. Despite a great decrease in the number of trains that could be operated, there was a significant increase in passenger travel as the Japanese people went into the country in search of food. Although there was a sharp decrease in freight movements, the railroads continued to carry a larger portion of the country's freight than did coastal shipping. It was not until 1950, when the Japanese economy entered a period of increasing activity because of the Korean War, that the Japanese railroad system began to make some progress toward rehabilitation. By 1952 the national railways carried more freight than at any time previously except for the war years, and a new record was set for the number of passengers carried. The proportion of the total freight carried by rail, however, remained about the same as before the war. Freight carried in 1952 by both national and private railroads aggregated 172,600,000 metric tons. In the same year these railroads carried 5.7 billion passengers, and the street railways carried 2.9 billion. The big problem facing Japanese railroads was the transportation of commuters, especially in the Tokyo area. Although by 1952 the national railways had doubled their electric railway capacity over prewar (1936) levels, passenger traffic had increased more than threefold.

Until 1908 government railroads had been administered first by the Home Ministry and later by the Communications Ministry. In December of that year they were placed under the newly created Railway Board, which was directly responsible to the Japanese Cabinet. In May 1920, the board was converted into the Ministry of Railways as an independent department of the government. This organization operated until 1943, when wartime conditions led to the creation of the Ministry of Transportation and Communications, which united the administration of railroads, highways, waterways, aviation, telephone, telegraph, radio, and postal services under a

single control. In 1945 the ministry was dissolved into two separate organizations, one for transportation and the other for communications. In December 1948, the Diet passed a law establishing the Japanese National Railways as a government corporation empowered to carry on all activities involved in the operation of the government-owned railroads. The Ministry of Transportation was given responsibility for supervision of the corporation, but the latter was made largely autonomous in its operations. The minister of transportation has the power to approve or disapprove new railroad construction, the taking over of other transportation enterprises, the supervision or cessation of any working line, and the inauguration of ferry service or motor transportation related to the railroads. He also supervises private rail lines.

Domestic Shipping.—Until its entrance into World War II, Japan probably moved a larger share of its domestic traffic by water than did any other country. In the prewar period the value of Japan's domestic waterborne commerce was twice that of its foreign commerce; only four ports in 1936 handled foreign trade with value exceeding that of their domestic trade.

The prewar importance of coastal shipping was due to a number of factors. Japan has a long coastline and numerous good harbors. The quiet waters of the Inland Sea make it possible for very small vessels to ply between the ports of Kobe and Osaka at its eastern end and Moji and Shimonoseki at its western end. Most of Japan's population and industrial centers are located on or near the coasts. The rugged terrain of the country has made railroad and highway development difficult and expensive. Lastly, before World War II water freight rates were as little as one third of the rail freight rates.

With World War I as an impetus, the Japanese merchant marine increased steadily until during the 1930's it ranked third in size behind the British and United States merchant marines. In 1940, Japan had a total of about 6,900,000 gross tons of all types of shipping, of which about 6,000,000 tons consisted of steel ships of 100 gross tons and over; 15 to 20 per cent of the total tonnage was engaged in coastal shipping.

The effect of World War II on Japanese coastal shipping was to shift many of these vessels to ocean shipping and thereby to place a greater emphasis on rail transportation for domestic freight movements. As a result of Allied sea and air operations, the Japanese merchant marine lost 8,900,000 gross tons of shipping. By the end of the war, therefore, despite wartime construction there were only about 4,000,000 gross tons of all types of shipping afloat, of which only 1,400,000 gross tons represented steel ships of over 100 gross tons in size. Moreover, a large part of this tonnage was unseaworthy.

By 1953 coastal shipping had not been able to regain its prewar position in freight movements, although the Korean War had resulted in substantially increased coastwise traffic, and the Japanese merchant marine had increased the tonnage of its steel ships of over 100 gross tons in size to a total of 2,900,000 gross tons. In October 1945, only about 750,000 metric tons were moved in coastal trade in all types of vessels; in 1950 these shipments averaged 3,725,000 tons monthly; in May 1951, a postwar peak of 6,160,000 tons was reached. Whereas in 1936 coastal vessels had moved 18 per cent of Japan's total freight,

in 1952 coastal vessels moved only 9 per cent of the total. Important factors in the poor postwar position of coastal shipping were artificially low railroad and truck rates and significant increases in the costs of building and maintaining ships.

Until 1937, Japanese shipping was in private hands and free from government control, although it had been subsidized by the government for many years. In that year, however, the Japanese government passed legislation which gave the Ministry of Communications (and later its war-time successor, the Ministry of Transportation and Communications) authority over civilian merchant shipping, including ship transfers, prices, construction, routes, and rates. Although the ministry relied at first on voluntary controls, by the outbreak of the Pacific war Japanese shipping was subject to full control by the ministry. In March 1942, the Japanese government seized all civilian-operated merchant shipping and paid the owners charter fees. The ships were then turned over to a newly created Shipping Control Association for operation. The control exercised by the association was terminated at the end of the war. The United States Naval Shipping Control Authority for Japan ((SCAJAP) was then established by the occupation authorities to supervise the control and operation of all Japanese merchant steel vessels of 100 gross tons and over. These controls were terminated with the end of the occupation in 1952, and the Ministry of Transportation exercised supervision over the merchant marine thereafter.

Highways.—Besides being the oldest means of transportation in Japan, highway transportation is the starting point of much other transportation. The existence of a large number of industrial facilities off the railroad lines makes it necessary for vehicles, under motor, animal, or human power, to haul freight to rail lines and to dockside.

The first systematic development of roads in Japan occurred during the Tokugawa era (1603-1867), when the shoguns laid out five trunk highways. These were (1) the Tōkaidō, connecting Tokyo with Kyoto along the coast, a distance of 310 miles; (2) the Nakasendō, connecting Tokyo with Kyoto through the interior, a distance of 324 miles; (3) the Nikkōkaidō, connecting Tokyo with Nikko (Tochigi Prefecture), a distance of 89 miles; (4) the Ushūkaidō, connecting Tokyo with Aomori, a distance of 465 miles; and (5) the Kōshūkaidō, connecting Tokyo with Shimosuwa (Nagano Prefecture), a distance of 132 miles. After the Meiji Restoration, these highways became the basis for Japan's modern transportation system, with railroads as well as highways following the routes of the old trunk roads.

Because of the rugged nature of the terrain, the concentration of the population along the coast, and the intensive development of railroads, highway development was neglected. This situation continued even after the introduction of motor vehicles, although the earthquake of 1923 caused the rebuilding of many highways and the building of additional roads to accommodate increased traffic. The industrial development and military preparations of the latter 1930's saw further development of Japanese highways. Yet in 1939 the length of national roads amounted to 5,350 miles, or only a slight increase over the mileage that had existed several decades before.

Although highway development did not keep pace with Japan's industrial development, motor trucks carried the major portion of the freight that was moved before World War II. In 1936 motor trucks transported almost 20,000,000 metric tons a month, or 55 per cent of the total freight moved in Japan.

The highway system suffered during the war from failure to keep up maintenance and from Allied military operations. Shortages of road-building materials continued into the postwar period, and, except for highways of strategic importance to the Allied occupation, little was done in the early postwar years to repair Japanese roads. The possibility that deteriorating roads might present an obstacle to Japan's economic recovery led the supreme commander for the Allied powers (SCAP), on Nov. 27, 1948, to issue a directive to the Japanese government to develop a comprehensive five-year public works program for the repair, maintenance, and extension of roads throughout the country. The United States continued to supply Japan with surplus army road-building machinery and with certain materials, especially asphalt. The Ministry of Construction, established on July 10, 1948, replaced the Ministry of Home Affairs (abolished Dec. 31, 1947) as the ministry responsible for Japanese road construction and maintenance.

There are four classes of roads in Japan—national (*kokudō*), prefectural (*fukendō*), municipal (*shidō*), and town and village (*chōsondō*). National roads were built originally to connect Tokyo with the headquarters of army divisions and naval bases, with the Ise Shrine, and with prefectural capitals. The minimum width of these roads is 24 feet. The full cost of military national roads and one half of the cost of other national roads were borne by the national government. Prefectural roads connect the prefectural capital with important places within the prefecture. Their minimum width is 18 feet, and one third of their cost is paid by the national government. Important city roads have a minimum width of 18 feet, and all other roads must be at least 12 feet wide.

In 1950 there were 515,000 miles of all types of roads, of which 6,000 miles were national roads, 72,000 miles were prefectural roads, 54,000 miles were city roads and streets, and the remaining 383,000 miles were town and village roads. Of the total mileage, only about 1.5 per cent represented paved roads; by types, 19 per cent of the national roads, 4 per cent of the prefectural roads, 7 per cent of the city roads, and 0.1 per cent of the town and village roads were paved.

It took five years after the end of World War II for highway transportation to recover fully from the effects of the war. The increased economic activity resulting from the Korean War was primarily responsible for an increase in the motor transport of freight to a level exceeding the prewar peak. A monthly average of over 29,000,000 tons of freight was moved in 1952, and in March 1953 a record of over 32,000,000 tons was reached. Trucks increased their share of freight moved to about 60 per cent of the total in 1952. Bus travel also increased, to a monthly average of 169,000,000 passengers in 1952.

The late and limited development of a motor vehicle industry in Japan was both a contributing factor and an effect of the retarded status of the highways. Until the mid-1930's, Japan was dependent on imported vehicles for most of its cars

and trucks; in 1938, Japanese motor vehicle production exceeded imports for the first time. Production generally increased until a peak output of about 48,000 motor vehicles of all types was reached in 1941. In March of that year there were 204,000 motor vehicles registered in Japan, including 120,000 trucks of various sizes. Production declined during the war and immediate postwar years, but began to rise again in 1947. By 1952 output had increased to an all-time peak of 177,000 vehicles. In February 1953, there were 732,000 vehicles registered in Japan (as compared with 53,294,493 registered in the United States in 1952), of which 415,000 were trucks; 273,000, passenger cars; 25,000, buses; and 19,000, special vehicles such as fire and police trucks and ambulances.

Air Transportation.—In 1910 the first airplane flight in Japan was made. World War I gave an impetus to the development of aviation in Japan, as it did in many other countries. Japanese military airplanes took part in combat for the first time in 1914, in the Tsingtao campaign against German forces. The first regular civil air service was inaugurated in 1922, when hydroplanes began to fly between Sakai, near Osaka, and the island of Shikoku. In January 1923, the newspaper *Osaka Asahi Shimbun* started regular service between Tokyo and Osaka. In July of the same year the Japan Aerial Navigation Company opened regular service between Osaka and Beppu. Airmail service was inaugurated in April 1925 between Tokyo and Osaka. With the formation of the Japan Air Transportation Company (Nippon Koku Yuso Kabushiki-kaisha) in 1929, Japanese civil air transportation began to develop on an extensive route basis. Regular flights were made between Tokyo, Osaka, and Fukuoka, and were later extended to Korea, Manchuria, Formosa, and the mandated islands. By 1938 the lines of this company extended over a distance of 9,575 miles, and it controlled virtually all of the commercial air routes in Japan.

As the Japanese government extended its control over all means of transportation and communications, the Japanese Ministry of Communications fostered the merger in 1938 and 1939 of all airlines into a new company, the Japan Airways Company (Dai Nippon Koku Kabushiki-kaisha). This company was a semi-governmental concern, with a monopoly over all Japanese civil air transportation. It was subsidized by the Japanese government, which also contributed one half of the company's capitalization of 100 million yen. At the end of 1939 the company was operating almost 12,000 miles of air routes. In the same year, Japan had about 120 civil aircraft, of which 85 were scheduled air carriers. About 4,800 airplanes were produced in Japan in that year, but almost all were allocated for military use. In 1939 the Japan Airways Company carried 69,268 passengers, 298 metric tons of freight, and 819 metric tons of mail.

After 1939 considerable expansion took place in the air routes of the Japan Airways Company. With the outbreak of the Pacific war two years later, civil aviation was placed under military control and the civil air routes were used to support military operations. At the end of the war all flying by Japanese was prohibited by the Allied occupation authorities. In November 1945, the Japan Airways Company was dissolved and all aeronautic research institutes and aviation

schools were ordered closed by a SCAP directive.

In 1950, SCAP permitted Japanese corporations to inaugurate air transport service, the actual operation of aircraft to be undertaken by foreign airlines. The first Japanese airline company to be established was the Japan Air Lines Company (Nippon Koku Kabushiki-kaisha), organized in August 1951. In October of that year, Japan Air Lines inaugurated in cooperation with Northwest Airlines the first postwar regular civilian air route, connecting Tokyo, Osaka, Sapporo, and Fukuoka. With the end of the occupation restrictions on Japanese aviation were removed, and in October 1952, Japan Air Lines undertook independent domestic operations. By the end of 1953 at least 11 other airlines were organized to conduct domestic service. In October 1953, a semigovernmental airline was created for international operations. The new company, also called Japan Air Lines, was established through an investment of 2 billion yen, one half by the original Japan Air Lines and the remainder by the Japanese government. It began overseas service to the United States in February 1954. In addition, 11 foreign airlines were engaged in air transportation with Japan at the end of 1953.

COMMUNICATIONS

Telephone and Telegraph.—Telephone service in Japan was first opened for public use in and between Tokyo and Yokohama, in December 1890. Long-distance service was not inaugurated until 1897, when Tokyo and Osaka were connected. The telephone service has usually been regarded as the least efficient communication system in Japan. Although Japanese telephone equipment is considered to be good, ever since telephone service was inaugurated there have been inadequate facilities to meet public demand. In 1940 there were about 1,000,000 telephone subscribers with about 1,500,000 telephones.

During World War II the telephone system suffered heavy damage from aerial bombing. About one fourth of the wire system and half of the telephone instruments were destroyed. Since then much rehabilitation has taken place. From a low of about 800,000 in 1945, the number of telephones increased to 2,400,000 by March 1953. In 1953 there were about 28 telephones in service for every 1,000 Japanese, compared with 310 telephones for every 1,000 persons in the United States. The number of telephone calls grew steadily in the postwar period, reaching over 200,000,000 monthly at the beginning of 1953, compared with a monthly average of 35,000,000 in 1941. Telephone routes cover about 50,000 miles and reach over 6,000 telephone exchanges.

Telegraph service, which was started between Tokyo and Yokohama in 1869, has become the most important means of telecommunications in Japan. In 1939 the number of telegrams sent in Japan exceeded the figure for any other country except the United States. In that year land telegraph lines covered 31,000 miles and connected over 13,000 telegraph offices. Since the end of the war there has been much rehabilitation of the war-damaged telegraph system. The previous peak of 7,000,000 telegrams per month reached in 1943 was surpassed in 1951, and in December 1952 an all-time peak of 9,200,000 telegrams was reached.

Telephone and telegraph services in Japan have always been a government monopoly under the direct control of the Ministry of Communi-

cations and of its wartime successor, the Ministry of Transportation and Communications. Telephone and telegraph services were placed under the Ministry of Electrical Communications in 1949, when the Ministry of Communications was split into two separate organizations for electrical communications and for postal services. On Aug. 1, 1952, the Ministry of Electrical Communications was abolished, and most of its functions were transferred to the Ministry of Postal Affairs. At the same time, there was created under the latter the Japan Telegraph and Telephone Public Corporation to operate Japan's telephone and telegraph facilities. For administrative purposes, the country is divided into 10 telephone and telegraph zones with regional bureaus in the following cities: Tokyo, Osaka, Nagoya, Nagano, Kanazawa, Hiroshima, Matsuyama, Kumamoto, Sendai, and Sapporo.

International Communications.—Japan's international communications facilities include radiotelegraph (wireless telegraph), radiotelephone (wireless telephone), and submarine cable.

Although Japan had radiotelegraph facilities in operation as early as 1908, these facilities were used until 1915 for domestic communications and for contact between Japanese ships and land. In that year the first overseas radiotelegraph message took place between Ochiishi in Hokkaido and Petropavlovsk (now Petropavlovsk-Kamchatski) in Kamchatka. Overseas radiotelegraph communications increased over the succeeding years, and direct circuits were established with the leading cities of the world. In 1925 the Japanese government established the Japan Wireless Telegraph Company (Nippon Musen Tsushin Kabushiki-kaisha), to which the government turned over its radiotelegraph facilities. In 1938 the government merged all international communications in a new company, the International Telecommunications Company (Kokusai Denki Tsushin Kabushiki-kaisha). Half of the stock of the company was owned by the government, and the election of its officers and directors, as well as the company's actions, was subject to the approval of the Ministry of Communications.

The first radiotelephone experiments in Japan were made in 1911, but it was not until 1923 that the service was opened to the public. At first radiotelephone communication was limited to service between ships in Japanese harbors and land. In 1932 the government decided to extend the service, and the International Telephone Company (Kokusai Denwa Kabushiki-kaisha) was formed. Soon radiotelephone service was extended to ships at sea, to Japanese colonies, and, between 1934 and 1937, to most parts of the world. In 1938 the International Telephone Company was also taken over by the International Telecommunications Company.

The International Telecommunications Company continued to operate for almost two years after V-J Day. On March 25, 1947, however, SCAP issued a directive to the Japanese government, ordering it to liquidate the company, and to take over the operation of international telecommunications directly. An International Telecommunications Division in the Ministry of Electrical Communications, created in 1949 as a result of the division of the Ministry of Communications, became the successor to the liquidated company. This function was transferred to the Ministry of Postal Affairs when the Ministry of Electrical Communications was abolished in 1952.

Local administrative bureaus for international telecommunications are located in the same cities as those for telephone and telegraph services.

Japan's international telecommunications transmitting and receiving facilities are handled by two systems: the Eastern Japan Radio Central at Tokyo and the Middle Japan Radio Central at Osaka. The principal transmitting station for radiotelephone communications is at Nazaki in Ibaraki Prefecture, and the principal receiving station is at Komuro in Saitama Prefecture. Radiotelegraph communications are handled through transmitting stations at Oyama in Tochigi Prefecture and Yosami in Aichi Prefecture and through receiving stations at Fukuoka in Saitama Prefecture, Yokkaichi in Mie Prefecture, and Ono in Hyogo Prefecture. In March 1953, there were 14,700 radiotelephone calls and 326,300 radiotelegraph messages. These figures represented approximately a fivefold increase and more than a threefold increase, respectively, over the 1949 monthly averages.

Before World War II, Japan had an extensive network of submarine cables connecting the various islands of Japan proper as well as connecting Japan with its colonies and with foreign countries. The principal overseas cables connected Nagasaki in Kyushu with Shanghai and Vladivostok (owned by the Great Northern Telegraph Company, Ltd., a Danish company), and Kamakura (near Yokohama) with Guam (owned by the Commercial Pacific Cable Company, a United States concern). Cables to Europe went through Vladivostok, while cables to the United States went through Guam.

Since the end of the war only the cables connecting the islands of Japan have been in full operation. In view of the development of radiotelegraph and radiotelephone facilities, it was believed that extensive use of submarine cables would probably not develop in Japan.

Radio and Television.—Japan's first radio program was presented over station JOAK in Tokyo on March 22, 1925. Within a few months stations were built in Osaka and Nagoya to meet a growing public demand for radio broadcasts. Before the end of the year the three stations were merged and the Broadcasting Corporation of Japan (Nippon Hoso Kyokai) was formed with the approval of the Ministry of Communications. The corporation was given a monopoly over all radio broadcasting in Japan. Until 1935 the corporation enjoyed considerable independence in its operations; beginning in that year, however, the approval of the Communications Ministry was required for virtually all actions.

When the war ended, the Allied occupation authorities directed the Japanese government to reorganize the Broadcasting Corporation of Japan and to eliminate the control over the corporation that the Communications Ministry enjoyed. When the Ministry of Communications was split in 1949, a Radio Regulatory Agency was created in the Ministry of Electrical Communications. This agency's major function was "to insure that the radio spectrum is employed expressly for the public interest, convenience or necessity in a fair and efficient manner in compliance with international and regional radio conventions, regulations, and agreements. . . ." Regional radio regulatory offices are located in the same cities as the regional telephone and telegraph bureaus.

Although the administration of broadcasting is centered in Tokyo, the actual operation of

local stations is under the control of so-called central stations in eight major cities: Tokyo, Osaka, Nagoya, Hiroshima, Sendai, Kumamoto, Sapporo, and Matsuyama. Two radio networks link these cities with each other and with the local stations. As of May 30, 1953, the Broadcasting Corporation of Japan operated 39 local broadcasting stations and 38 rebroadcasting stations in addition to the 8 central stations. Revenue for the support of the corporation, which excludes advertising, is derived from a license fee of 50 yen per month for each radio receiving set. Overseas broadcasting, which had been suspended since the end of World War II, was resumed by the corporation in February 1952.

Commercial radio broadcasting was initiated in April 1951 with the issuance by the Radio Regulatory Commission (successor to the Radio Regulatory Agency) of licenses to 16 commercial radio stations. As of July 31, 1953, there were 33 commercial stations in operation, supported by paid advertising. The commercial stations organized the National Association of Broadcasters in Japan (Nippon Minkan Hoso Renmei) in 1951 to enforce an ethical code of broadcasting.

Television began in Japan in February 1953 with a telecast from Tokyo by the Broadcasting Corporation of Japan. Subsequently stations were opened in Osaka and Nagoya, and a five-year program called for the completion of 29 other television stations by the corporation by the end of 1956. A monthly fee of 200 yen is charged per set to support the corporation's television operations. Commercial television also got under way in 1953 with the organization of the Japan Television Network Corporation.

Postal Services.—Japan's postal system began in 1871, when service was inaugurated between Tokyo and Osaka. In that year post offices were opened in five other cities and service began between Tokyo and Nagasaki, delivery between the two cities taking from 7 to 8 days. In the following year post offices were opened in all other important cities and towns. There was a steady development thereafter, and within 10 years there were 5,500 post offices.

Foreign mail service was established in 1872 with the creation of British, United States, and French post offices in Yokohama, Kobe, and Nagasaki. The United States post offices were withdrawn in 1873, and the French and British post offices were withdrawn after Japan signed the International Postal Convention in 1877.

Postal savings and postal money order services were started in 1875, parcel post service in 1892, and airmail service in 1925. Other services include an extremely rapid special delivery, registered mail, postal life insurance, the receiving of taxes for the government, the payment of government pensions, and the sale of government bonds. Many local post offices are also telegraph and telephone offices.

The postal system was originally operated by the Ministry of Communications and its wartime successor, the Ministry of Transportation and Communications. In 1949, when the Ministry of Communications was split up, an independent Ministry of Postal Affairs was created. Ten regional postal bureaus were established in the same cities as the regional telephone and telegraph bureaus. Local post offices were originally divided into five and then into three classes depending upon the size of the city or town in

which they were located. In 1941 this classification was dropped and two groups, ordinary post offices (formerly 1st and 2d class) and special post offices (formerly 3d class), were created. In July 1953, there were 678 ordinary and 13,514 special post offices. At the same time there were 177.5 million postal savings accounts with total deposits amounting to about 294 billion yen, and postal life insurance policies with a total face value of about 752 billion yen.

10. FINANCIAL DEVELOPMENT.

The old Japanese merchant houses which developed in the feudal period, mainly in Osaka, carried on a limited, rudimentary type of banking operation. They acted as financial agents for the daimyō, selling their rice in the few commercial centers and transmitting funds to the various localities. In times of crop failure they granted loans to the feudal lords. As in Great Britain, many of the leading modern banks in Japan can trace their origins to old merchant bankers, houses such as Mitsui, Iwasaki, and Konoike. It was these *chōnin* (townsmen, or merchants)—especially of Osaka, where 70 per cent of Japan's wealth was concentrated—who provided the financial support which made possible the overthrow of the Bakufu. And it was their financial support, by means of contributions and loans (*goyōkin*), which enabled the new regime to establish itself. The Japanese economic historian Eijiro Honjo states that in the very earliest days of its existence, in December 1867, the Revenue Office (Kinkoku-suitoshō) of the new government issued an urgent plea to Mitsui-gumi for financial aid.

The confused and disorderly state of the currency at the time of the Meiji Restoration of 1868, brought about largely by the varying coinage and paper money emissions of the daimyō and the continued debasing of the coinage by the shogunate government, was increased by the paper money issues of the new government. These issues were necessary because during the early years the new government was unable to balance its budget. The cost of suppressing the hostile clans resulted in 25 million yen of expenditure in 1868, while government revenues plus loans from the merchant bankers or exchange houses amounted to only 9 million yen, leaving a deficit of 16 million yen to be covered by paper money issues. In the following year expenditures totaled 20.8 million yen, while revenues, including *goyōkin*, were only 10.5 million. After the clans were put down and the han (feudal district governments) were abolished, other expenses developed. The note issues of the han governments were assumed by the state, which also took over the debts of the daimyō

and had to provide indemnities for the Buddhist sects on their disestablishment. As a result, in 1872 expenditures totaled 58 million yen but revenues amounted to only 33 million yen. The expedition to Formosa and the Saga Rebellion in 1874 and the very serious Satsuma Rebellion of 1877 added to the burden of expenditure. The voluntary privilege given to the upper feudal classes in 1873 to capitalize and exchange their annual hereditary pensions for government bonds was made compulsory in 1876; this added 190 million yen to the public debt.

As E. Herbert Norman, chief of the postwar Canadian mission in Japan, states, "In Japan the feudal lord ceased to be a *territorial* magnate drawing his income from the peasant and became instead, by virtue of the commutation of his pension, a *financial* magnate investing his freshly capitalized wealth in banks, stocks, industries, or landed estates, and so joined the small financial oligarchy." The holders of pension bonds found banking an attractive field as a result of the liberalization of the national bank regulations in 1876. Consequently, between 1876 and 1880, 148 new national banks, all authorized to issue inconvertible paper money, were established.

In 1871, Assistant Secretary of Finance Hirobumi Ito (later Prince Ito), had been sent to the United States to study banking and financial institutions. As a result of his suggestions, and over the objections of the advocates of a European-style central bank, the Japanese National Bank Law, closely patterned after the United States National Bank Act, had been passed in 1872, mainly to unify the country's currency and to replace the inconvertible paper money with national bank notes redeemable in gold and silver. Until 1876 only four banks were established under this law, the most important being the First National Bank (Dai Ichi Kokuritsu Ginko), founded jointly by the Mitsui and Ono houses. (National banks took as trade names their Ministry of Finance registration number.) Specie holdings of the banks were required to amount to two thirds of their note issue, which was to be convertible. Since government inconvertible paper money emissions continued, specie began to command a premium and the national bank notes were immediately presented for redemption. As a result of this development, and to maintain the value of the bonds issued to the daimyō as a lump sum settlement for their hereditary pensions, the bank law revision of 1876 made it possible for the pensioned daimyō to use their government bonds to finance banking activities and suspended the specie convertibility requirement. The largest of the new banks, which sprang up in the banking boom which the new revision made possible, was the Fifteenth (Jugo) Bank, established in 1877 by a group of nobles, with a capital of 18 million yen. The new banks added 34 million yen to the inconvertible paper currency total, which by 1879 reached 170 million yen, while the total government debt rose to 254 million yen.

As a result of the steady increase in paper money and in government debt a violent inflation developed. The price of rice, by far the most important commodity, doubled between 1877 and 1880. Specie began to flow out of the country in large amounts. Anxious to adopt modern forms, the new government had established a gold standard in 1871. Patterned on the United States coinage law, the gold yen was defined

as containing 25.72 grains of gold, 9/10 fine. At the same time a 1 yen silver coin containing 416 grains of silver, 9/10 fine, was issued to be used exclusively at the treaty ports. (The silver yen was equivalent in metallic content to the Mexican silver dollar, then widely used in trade in the Orient.) The constant emissions of paper money and its depreciation, however, soon led to the disappearance of gold, and in 1878 the bimetallic standard was adopted, the government allowing the use of 1 yen silver pieces as legal tender throughout the country. In effect, however, the country was on a *de facto* silver standard. As the inflation developed, the paper money depreciated in terms of silver until by 1881, 1 yen of silver was equivalent to 1 yen 80 sen of paper. In October of that year, Count (later Prince) Masayoshi Matsukata was transferred from the position of minister of home affairs to that of minister of finance and financial conditions were taken in hand.

A New Foundation and Stability, 1881-1913.—Matsukata's first efforts were directed toward building up a specie reserve so that government paper money might either be made convertible or be retired. In 1880 the Yokohama Specie Bank (Yokohama Shokin Ginko), the first of a long line of special banks, had been established for the purpose of discounting foreign bills of exchange on the security of exported goods. The main object was, on the one hand, to encourage the direct export trade; on the other, to secure specie. The system worked poorly at first, but a revision in the bank's practices and procedures, instigated by Matsukata and made effective in March 1882, resulted in very considerable improvement, with the result that the government's specie reserve rose from 8 million yen in 1881 to more than 42 million yen at the end of 1885 and continued to grow thereafter. The government used its specie reserve gradually to retire its inconvertible paper money.

The next step was the establishment of a central bank, the Bank of Japan (Nippon Ginko), in October 1882. The bank's charter ran for an original term of 30 years; half of its 10 million yen capital was supplied by the government. Modeled after the National Bank of Belgium, the new bank issued convertible bank notes, held specie reserves of the national banks, acted as fiscal agent for the government, discounted the Yokohama Specie Bank's foreign bills, granted loans to subsequent special banks, and absorbed government bonds. It failed to act as a bankers' bank in the fashion of European central banks, nor did it exercise any extensive control over the money market, since its discount rate and open market policies were the result of treasury requirements more than of its own policies.

With the establishment of the central bank the task of retiring the national bank notes was begun. In 1883 the national bank law was amended to provide that the charters of national banks (originally issued for 20 years) should not be renewed, and that national bank notes were to be redeemed gradually with Bank of Japan convertible notes. National banks were gradually converted into ordinary banks, and 1899 saw the end of the last national bank. There followed the rapid growth in the number of ordinary banks (which did not have the note issue privilege, this now being confined to the Bank of Japan), and the increase in their im-

portance resulted in regulatory statutes being promulgated in 1890 and put into force in 1893. Under the Ordinary Bank Law, all banking institutions were placed under the control of the Ministry of Finance, which licensed new banks, controlled mergers, and generally supervised the conduct of banking business. The years 1893–1901 witnessed the greatest growth of Japanese banking. The number of banking institutions of all types increased from 703 in 1893 to 2,359 in 1901. In the latter year a panic occurred, causing a number of bank failures, especially among the small banks. As a result, the banking law was amended to provide that joint stock banks should have a capital of at least 500,000 yen, and private banks a capital of 250,000 yen. This measure encouraged bank consolidations, and by the end of 1913 the number of banks had declined to 2,156.

Matsukata's currency reform plans halted the inflation of the late 1870's, and the money contraction led to a severe depression, in 1883–1884. The price of rice fell sharply and farm discontent grew, but the government, despite protests, refused to be diverted from its task—to place Japan on a sound, convertible money basis. The redemption of the inconvertible notes continued steadily. The deflationary policy was mitigated somewhat by the concomitant depreciation of silver in terms of both gold and commodities. This continued decline of silver led to a rise in the price level, particularly in the early 1890's, and, since by that time Japan was conducting two thirds of her trade with gold standard countries, with the result that exchange rates were highly unstable, a commission was appointed in 1893 to study the problem. The commission recommended that the money base be changed and advocated a gold standard. In March 1895, Matsukata returned to the post of finance minister. In the following month Japan concluded with China the Treaty of Shimonoseki, which provided that China pay Japan a war indemnity amounting to 200,000,000 taels or £38,000,000 (360 million yen). This fortuitous windfall was utilized to enable Japan to adopt a gold standard. Arrangements were made to have this indemnity paid in sterling instead of in taels; part of the sum was brought back to Japan in gold and part was maintained in Britain as a foreign exchange reserve. By the Gold Standard Law of 1897, the unit of value, the yen, was fixed at 11.574074 grains of pure gold, equivalent to \$.49845 (pre-1934 dollar). By the end of the 19th century, therefore, Japan had stabilized her money structure by the adoption of the gold standard and by the retirement of practically all the government paper money and national bank notes.

Matsukata's view that the peculiar conditions of Japanese development required banks of a specialized nature in addition to the ordinary banks led to the establishment of the Hypothec Bank (Nippon Kwangyo Ginko) in 1897, the Bank of Formosa (Taiwan Ginko) and the Hokkaido Colonial Bank (Hokkaido Takushoku Ginko) in 1899, the Industrial Bank (Nippon Kogyo Ginko) in 1900, and the Bank of Korea (Chosen Ginko) in 1909–1911.

The Hypothec Bank, modeled upon the Credit Foncier of France and capitalized at 10 million yen, was authorized to make loans having a maturity of up to 50 years on the security of such immovable property as paddy and upland

fields, forests, and fishing rights. In addition, it might make loans to public authorities, co-operative societies, and agricultural and fishing associations and issue debentures up to 10 times (this was later increased) its paid-up capital. Such deposits as it accepted had to be invested in government bonds and bills of exchange. Simultaneously, 46 agricultural and industrial banks were established, one in each prefecture; they functioned as local subsidiaries of the Hypothec Bank. The bank is still in operation.

The Industrial Bank of Japan, modeled upon the French *Crédit Mobilier*, was established to carry out the government's policy of developing such new industries as the political and economic realities of the time required. As a result, it granted loans to the shipbuilding, public utility, iron and steel, chemical, and other heavy industries. As in the case of the Hypothec Bank, its loan funds were obtained by the sale of debentures, which were at first limited to 10 times its paid-up capital. Through the years the bank has served as an organ of state policy and has from time to time made loans considered to be in the strategic interest of the nation.

Another important financial agency, developed in the early days of the restoration and continuing to play an important role, is the Deposit Bureau of the Ministry of Finance, established in 1877 after the pattern of the British post office savings system. The bureau is entrusted with the very considerable postal savings and postal insurance funds of the Japanese people. The popularity of this method of saving among the large number of small depositors is seen by the fact that the system grew from about 300,000 depositors with 9 million yen of deposits in 1885 to 12 million depositors with 189 million yen of deposits in 1914. The Deposit Bureau gains its importance from the fact that it serves to funnel the mass savings of the whole people into investment channels favored by the state. The bureau invests its funds in government securities and in the debentures of the special banks. It has made loans to national policy companies, essential government-sponsored enterprises, and government-approved colonial projects.

In the field of public finance the national debt, which had risen sharply during the early unsettled years of the restoration and had reached 240 million yen by 1877, remained stable until the advent of the Sino-Japanese War of 1894–1895. The debt, which stood at 234 million yen in 1894, rose by 117 million yen as a result of the war and by 1903 reached 539 million yen (including about 100 million yen for the building of the national railways), of which 98 million yen had been borrowed abroad. The war against Russia (1904–1905) cost Japan about 1.5 billion yen, of which 1.2 billion yen was borrowed abroad. The alliance with Britain in January 1902 gave Japan greater access to the British capital market, and with Japanese military successes against Russia the borrowing rate in London fell from 6 per cent in 1904 to 4½ per cent in 1905. By 1907 the total Japanese national external and internal debt stood at 2.2 billion yen. Thus, as a result of two wars between 1894 and 1905, the national debt had increased tenfold. By 1914 it stood at 2.5 billion yen.

To meet growing central government expend-

itures, which rose elevenfold between 1869 and 1899 and by 1914 were three times the 1899 level, taxes were raised steadily. Under the shogunate revenues had come chiefly from the land tax, which was arbitrary in amount and payable in rice. During the 1870's land tax reform was undertaken. A capital value was fixed for each piece of land by capitalizing, at rates varying from 6 to 7 per cent, the net average produce of the unit over a five-year period, valued at then current prices. On such valuations a tax of $2\frac{1}{2}$ per cent was levied. Some 1,500 nuisance taxes were abolished, and by 1879-1880 four fifths of the whole tax revenue came from the land tax. Although the tax rate was raised to 5 per cent in 1899 and to as much as $11\frac{1}{2}$ per cent after the Russo-Japanese War, the growth of other taxes, mainly indirect, such as the liquor excises, the tobacco monopoly revenues, the customs, and stamp duties, brought the land tax receipts down to only one fifth of total ordinary receipts just prior to World War I.

World War I, 1914-1920.—Whereas in the years immediately prior to the war Japan had had an excess of imports and had experienced international financial difficulties and strains, the unparalleled wartime demand for her goods and services led to a sharp reversal of the trade balance. As a result, Japan's net credits on international account from trade and services aggregated over 3 billion yen between 1914 and 1919, or about 1 billion yen more than her total foreign indebtedness in 1913. She did not, however, use these foreign earnings primarily to repay debts owed abroad. Instead, she used them to make foreign investments, mainly short term, and to increase the combined gold reserves of the Bank of Japan and the Japanese government. These rose from 342 million yen at the end of 1914 to 2.1 billion yen at the end of 1920. Despite this rise in gold reserves, Japan in 1917 placed an embargo on gold exports, which was not lifted until January 1930. When the United States embargoed gold in September 1917, Japan was unable to convert her foreign credits into gold imports and the Japanese exchange bankers, principally the Yokohama Specie Bank, encountered great difficulties. Their advances to exporters were offset only by frozen credits overseas. As a result, they were forced to borrow from the central bank and sell their foreign holdings to it. The central bank's loans to the exchange banks grew from 44 million yen in December 1913 to 444 million yen at the end of 1918. As was to be expected, the note issue also rose sharply, from 385 million yen in December 1914 to 1.5 billion yen in December 1919. As Japan changed from debtor to creditor, prices climbed rapidly, industrial activity grew, real wages fell, and rice riots developed. Due to the war Japanese banks almost entirely took over the financing of Japanese foreign trade. Whereas in 1913 the Yokohama Specie Bank and the Bank of Formosa together financed 50 per cent of Japan's imports and 59 per cent of her exports, in 1918 they financed 95 per cent of the imports and 83 per cent of the exports.

As banking resources mounted during the war, a bank consolidation movement developed. Banks with a capital of less than 500,000 yen fell in numbers from 1,755 at the end of 1913 to 1,054 at the end of 1920, while those with a capital of 10 million yen and over rose from

15 to 46. Both the larger private banks and several of the special banks undertook operations in China during the war. The boom reached a peak in 1919, and as the year advanced a tightening in money conditions became apparent. Finally, in March 1920, the bubble burst and the stock market crashed, the index number of 120 leading securities falling from 250 in January to 165 in April. Commodity prices dropped and banks began to face runs and to fail. The Bank of Japan was forced to intervene and to grant liberal aid to distressed financial institutions, while the government aided basic industry by substantial advances from the Industrial Bank of Japan.

The Difficult Interwar Period, 1920-1931.

—Two additional serious banking crises and an attempt to strengthen the banking system by requiring more adequate minimum capitalizations led to a series of consolidations and mergers which, coupled with numerous bank failures, reduced the total number of banks from 2,285 in 1918 to 913 in 1930. A severe crisis developed with the occurrence of the earthquake of Sept. 1, 1923. Again the intervention of the Bank of Japan and of the government itself held the number of bank failures to a minimum and shortened the length of the moratorium, despite the fact that 76 of the 84 clearing banks of Tokyo lost their main offices in the earthquake. The government agreed to reimburse the Bank of Japan to a maximum of 100 million yen for any losses incurred in the discount of bills in the stricken area. As a result, the Bank of Japan extended credit to banks on far more liberal terms than usual and discounted large amounts of what were called "earthquake bills." Loans and discounts of the Bank of Japan rose from 580 million yen at the end of 1922 to 862 million yen at the end of 1923. The next, and most severe, crisis came in April 1927. On April 28, the Fifteenth or Peers Bank, one of the five largest, failed and some 36 large banks and many smaller ones immediately followed suit. A special session of the Diet authorized the Bank of Japan again to come to the assistance of the banks and provided government indemnification for any losses the bank might sustain.

The bank failures were due in part to the nature of the banking operations in which the Japanese ordinary private banks, especially the country banks, were engaged. Their assets consisted mainly of promissory notes backed by collateral not easily liquidated because it represented long-term loans to industry and agriculture, particularly advances on mortgages of land and buildings. Entry into this hazardous type of banking business was partly due to failure to develop the bankers' acceptance and a discount market. Also responsible was the shortage of high-grade stocks or bonds, which resulted from the fact that so many of the great business undertakings were in the hands of the *zaibatsu*, which seldom resorted to the securities market. There was no popular tradition in Japan of security ownership, only a rudimentary capital market, and almost no investment banking mechanism in the Western sense.

The banking law was amended in 1927 to double the minimum capital requirements of banks. Banks in Tokyo and Osaka had to have a minimum of 2 million yen capital; other banks, 1 million yen. Government powers of bank inspection were strengthened. The crisis and the

higher capital requirements stimulated the bank consolidation movement. In the 18 months following the April 1927 banking crisis, 328 banks were absorbed by consolidations. By the end of 1928 the "big five" banks (Mitsui, Mitsubishi, Dai Ichi, Sumitomo, and Yasuda) held 34 per cent of the deposits of all ordinary banks in Japan.

Japan's desire to return to the gold standard after World War I was thwarted and delayed by losses of gold reserves, by an excess of imports over exports, and by the fact that she once more became a borrowing country. From 1920 to 1929 Japan paid out the balances accumulated abroad during the war and sold her bonds abroad. The specie holdings of the government and of the Bank of Japan fell from 2 billion yen at the end of 1919 to 1.1 billion yen in March 1929. In the summer of 1929 the Minseito Party assumed power with Junnosuke Inouye as finance minister. Minister Inouye, who had long advocated classical financial principles, announced his intention of removing the gold export embargo and of restoring the gold standard. On Jan. 11, 1930, the gold embargo was removed, officially re-establishing the old prewar gold parity of \$49845 per yen. The timing of the attempted return to the gold standard was unfortunate, and it was followed by an extremely severe deflation, the Bank of Japan's index of wholesale prices falling from 155 in December 1929 to 110 by the end of October 1931. The gold reserves of the Bank of Japan fell from 1,072.3 million yen at the end of 1929 to 469.5 million yen at the end of 1931. Inouye persisted in attempting to balance the budget, even to the extent of reducing military and naval expenditures. Agrarian and military discontent grew, and the government fell in December 1931. Two months later, Inouye was murdered by "patriotic elements."

War Economy, 1931-1945.—The new government of the Seiyukai Party immediately reimposed the gold embargo and introduced control over international capital transfers and foreign exchange transactions by means of the Capital Flight Prevention Law of July 1, 1932 and the Foreign Exchange Control Law of May 1, 1933, later revised several times. The new finance minister, Korekiyo Takahashi (who served from May 26, 1932 to Feb. 26, 1936), initiated a deflation policy whereby mild deficits were incurred to stimulate the economy. The sharp growth in military expenditures provided an inflationary filip. The total army and navy budget rose from 434 million yen in 1931 to 7,266 million yen in 1940. The military budget, which represented 29 per cent of total expenditures in 1931, rose to 75 per cent of total expenditures in 1938. Naturally, military expenditures on this scale could not be financed out of current tax revenues. Deficit financing caused the total national debt outstanding to rise from 6.8 billion yen on March 31, 1931 to 31.1 billion yen on March 31, 1941. The necessity of absorbing this expansion of the public debt, as well as of meeting the capital demands of the expanding munitions industries, led to a material increase in the expansion of bank credit despite a sharp decrease in the number of banks. While the number of ordinary commercial banks declined from 782 to 186 between Dec. 31, 1930 and Dec. 31, 1941, deposits rose from 8.7 billion yen to 29.8 billion.

Early in 1936, Takahashi announced that re-

covery had been achieved and that the time had come to call a halt to inflation. He was assassinated shortly thereafter and his successor proved more amenable to theories of military economics. Takahashi had kept the budget within 1.9 to 2.2 billion yen. After his murder it was doubled and then rose even more sharply to 18.7 billion yen in 1941-1942. He had considered 600 million yen a safe limit for government deficits, but the deficit was increased to 1.5 billion yen in 1937-1938 and to 6.9 billion yen in 1941-1942. He had believed that the inflationary influence of government deficits could be minimized if banks and investment institutions invested the liquid funds they created in government bonds. This "capital circuit," he believed, would result in easy money and declining interest rates but would check an increase in the Bank of Japan note issue. During the new era in Japanese fiscal policy, which his murder inaugurated, the note issue of the Bank of Japan rose from 1.7 billion yen (Dec. 31, 1935) to 5.9 billion yen (Dec. 31, 1941).

The beginning of the active war against China in 1937 saw a sharp intensification of government control over the financial apparatus. A variety of measures were adopted, beginning with the Temporary Funds Adjustment Law of September 1937, to direct capital and credit into the war industries and to dry up the flow to the nonessential industries. Toward this end, effective use was made of the special banks, particularly the Industrial Bank of Japan, whose borrowing power was expanded to make possible extensive financing of government-sponsored munitions and overseas projects and national policy companies. Financial institutions and security underwriters were required to obtain permission from the Ministry of Finance either when making long-term loans or when subscribing to or underwriting securities. In August 1941 a munitions bill acceptance system was established.

In the 55 years of its existence prior to 1937, the Bank of Japan had adhered to what was considered relatively orthodox central banking practice. In the ensuing 5 years, culminating in the new Bank of Japan Act of 1942, every orthodox tenet of central banking was violated, and the bank took on every conceivable financial task, including long-term industrial financing. By the end of 1941 total assets of the bank, which had stood at 2.4 billion yen on June 30, 1937, reached a new high of 7.7 billion. This expansion was attributable for the most part to the growth in government bond holdings, which rose over the same period from 880 million yen to 5.3 billion yen, an increase of 507 per cent. By the end of 1941 the bank had been almost completely converted into a tool for government war finance.

Government control over the financial system was tightened greatly after Japan's entrance into World War II. The charter of the Bank of Japan, which had been renewed for an additional 30 years in 1912, expired early in 1942 and the government took the opportunity, in the act renewing the charter indefinitely, to place the bank completely under the control of the minister of finance. It also increased the bank's lending power by removing most of the remaining provisions regarding necessary kinds of security. The National Financial Control Association (Zenkoku Kinyu Tosei Kai) and a number of subsidiary control associations were established in 1942. The association acted as a central advisory and coordinating organization between the minister of

finance and the various financial institutions. Its principal function was participation in the formulation and application of the government's yearly financial plans for (1) the collection of savings, (2) the issuance of corporate debentures, and (3) the absorption of government bonds. These plans were the main basis for government wartime financial programming. They set savings goals, allocated savings quotas, and established government bond absorption targets. The National Financial Control Association was entrusted by the Finance Ministry with the task of carrying out the Ordinance for the Consolidation of Financial Institutions of 1942, which gave the finance minister broad powers to bring about amalgamations of banks, trust companies, and other financial institutions. Under this program consolidation was carried forward vigorously, and by Aug. 31, 1945 the number of ordinary banks had been reduced to 61 (from 186 at the end of 1941) and the number of savings banks to just 5 (from 69 at the end of 1941).

A variety of new financial institutions were established to assist in various phases of war finance. The most important was the Wartime Finance Bank (Senji Kinyu Ginko), which, capitalized at 300 million yen, was patterned after the Industrial Bank of Japan and performed somewhat similar, though (perhaps) what at the time appeared to be more speculative, functions. The formation of the Munitions Ministry in 1943 led, in 1944, to the establishment of the munitions company financing system, under which companies performing basic war production functions were assigned to designated banks, which were then responsible for meeting their financial needs. These loans were in turn guaranteed by the government.

Despite a basic tax revision in 1940, which attempted to give central importance to the income tax as the chief revenue producer, Japan, in contrast to Great Britain and the United States, made no serious attempt to finance the war by any appreciable degree of taxation. The proportion of Japanese government revenues to expenditures, which stood at 74 per cent in 1936-1937, declined to 24 per cent in the fiscal year 1944-1945—a clear indication of the increasing degree of Japan's dependence on deficit financing. The resultant growth of the national debt carried it by the end of the war to 177 billion yen, or 17 times greater than the prewar (1936) figure of 10.3 billion yen. The absorption of so large a deficit year after year expanded the credit base and brought on some degree of inflation, particularly in the last year of the war. Money in circulation in Japan rose 785 per cent between 1940 and 1945, in contrast to the 240 per cent increase in the United States. The ballooning of the whole financial system in Japan is seen in the growth of the total assets of all ordinary banks. These increased by 27.5 billion yen during the Sino-Japanese War period and by approximately 100 billion yen during the World War II period.

Finances in Defeat and Reconstruction, 1945-1954.—The pent-up inflationary pressures, which had been partly restrained and repressed during the war, broke loose with the collapse of Japanese governmental authority. Partly because of uncontrolled disbursements in the months immediately after surrender, the note issue doubled between August 1945 and February 1946, and prices rose 295 per cent. As a result, occupation authorities formulated a control program, which

included a currency conversion program, the freezing of deposits, 100 per cent taxation of war indemnities, a capital levy, and the establishment of an economic stabilization board.

The currency conversion plan carried out in March 1946 temporarily reduced the currency in circulation from 62 billion yen in late February 1946 to 15.2 billion yen on March 12, 1946, but it had no lasting influence. By September 1946 the volume of new note issue had reached 64 billion yen, surpassing the preconversion peak. As a result of the conversion, some 45 billion yen were frozen in old yen blocked accounts in the banks.¹ Since individuals were permitted to convert only 100 yen per person, all additional yen had to be deposited in the blocked accounts. Withdrawals from these old yen blocked accounts were limited by the Ministry of Finance, although no restrictions were placed upon the deposit or withdrawal of new yen. In August 1946 the old yen blocked deposits were divided into first and second blocked accounts, because with the cancellation of war indemnities many of the corporations had become technically insolvent and could not repay their wartime loans, nor was the government permitted to make good its guaranty of these loans, thus rendering the majority of banks technically insolvent. Under a series of emergency financial laws steps were outlined under which both banks and corporations were to reorganize, write off their unrealizable wartime assets and liabilities, increase their capitalizations, and begin anew. In the case of the banks, losses were written off by canceling the bulk of the second blocked deposits. This reorganization process was completed by mid-1948, at which time all restrictions were removed from the first blocked deposits and from such part of the second blocked deposits as were not needed to offset losses. Most of the banks were recapitalized at this time, and the formerly *zaibatsu*-named and -controlled banks changed their names, although the original names were restored shortly after the end of the occupation in 1952.

A new financial institution, the Reconstruction Finance Bank (RFB), was established in October 1946; it began operations in January 1947. While its original purpose had been defined as the financing of Japanese industry's requirements for new and replacement capital goods, its funds were used more and more to meet the ever-increasing working capital needs of Japanese business, as operating deficits grew larger and larger with the inflationary distortion of costs. The outstanding loans of the bank rose from 4.1 billion yen in January 1947 to a peak of 132 billion yen in March 1949, at which point its activities were curtailed, for it had become a prime vehicle of inflation, and its outstanding loans were a kind of side-pocket government deficit.

The mounting inflation which characterized the first few years of the postwar period caused growing concern among Allied occupation authorities. By May 1949 the price level was some 200 times the prewar 1934-1936 base. Note issue of the Bank of Japan had risen twelvefold since the surrender. Budget deficits grew. National debt rose from 128 billion yen at the end of 1944 to 575 billion yen at the end of 1949. Despite an occupation-sponsored capital levy, a 100 per cent tax on war indemnities, and reform of the income, capital gains, estate, and gift taxes, in 1946-1947

¹ On Jan. 21, 1946, the government froze all bank deposits of business corporations.

tax revenues failed completely to keep pace with mounting expenditures.

Alarmed at this prospect, the United States Departments of State and of the Army publicly directed the supreme commander for the Allied powers (SCAP) to order the Japanese government to "carry out an effective economic stabilization program calculated to achieve fiscal, monetary, price and wage stability in Japan as rapidly as possible." Accordingly, a nine-point economic stabilization program was adopted in late 1948 and, in early 1949, Joseph M. Dodge, former president of the American Bankers Association and president of the Detroit Bank, was sent to Japan, with the rank of minister, to see that the financial rehabilitation program was developed effectively.

The achievements of the first Dodge mission may be summarized as follows: (1) It ended deficit financing and produced a balanced budget for the first time since 1930. (2) A single foreign exchange rate was set at 360 yen to the U.S. dollar. In the mid-1930's the yen had been worth about 28 cents and immediately after the surrender a military conversion rate of 15 yen to \$1 had been established. This was raised to 50 to 1 the following year, and in mid-1948, with the advance of inflation, to 270 to 1. For the conduct of foreign trade a complex multiple exchange rate structure had been in effect. (3) The deficit loans and enormous credit expansion activities of the RFB were halted. It was required that all RFB debentures be retired by the end of the 1949-1950 fiscal year and that new loans by the RFB be permitted only to the extent of repayment of outstanding loans. (4) Stock markets in the principal cities, which had been closed since the end of the war, were reopened in order to stimulate the flow of capital into industry and to maximize security investment. (5) The control and management of the Bank of Japan was reorganized. A policy board of seven members, modeled after the board of governors of the United States Federal Reserve System, was established. The purpose was to free the bank from domination by the Ministry of Finance. The functions of the board include the determining of policies of basic credit control, open market, discount rate, loans, and other matters, which the bank then carries out.

Shortly after Dodge left in April 1949, a tax mission, headed by Professor Carl S. Shoup of Columbia University, arrived in Japan. Its recommendations, contained in an exhaustive four-volume report, increased the emphasis upon the income tax as the main source of Japanese national government revenues, reorganized the tax on corporate profits, and gave the local governments independent tax sources of their own, principally a revised real property tax. Dodge returned to Japan in November 1949 to ensure that the budget for the fiscal year 1950-1951 remained balanced.

Until the outbreak of the Korean War in June 1950, Dodge's program halted the inflationary spiral. From this point on, however, prices began moving upward again. The budget became unbalanced once more, but taxes continued to be reduced. The banks overextended themselves by making illiquid long-term capital loans to industry. Bank of Japan note issues soared again, and by 1954 wholesale prices were more than 50 per cent above June 1950 levels. As a result, the government in 1954, undertook a new program

of fiscal restraint, designed to balance the budget, limit government capital outlays, and lower prices.

11. GOVERNMENT. Japan passed through a period of political experimentation unprecedented in history in the nearly seven years of military occupation following the close of World War II in 1945. Whatever the lasting effects of this interesting experiment may be, they can be viewed in proper perspective and evaluated accurately only after a considerable passage of time.

The national program of westernization adopted in the 19th century never had the opportunity to achieve full and natural development, since it was at best a superficial adoption of the organization and structure of European and American institutions. This resulted in façades which concealed traditional concepts and attitudes that were much too deeply rooted to be easily superseded by alien ideas and ways of doing things.

While the Japanese governmental structure before World War II was as Western and modern as any in Europe or America, the concepts and attitudes which constituted the mainsprings of government and politics bore little if any resemblance to those of the West. Nor could the behavior and actions of the leaders or the people be judged in terms of Western patterns or standards of value. Needless to say, the inception of the modern Japanese political system was impelled more by external pressures than by internal needs to establish a Western type of constitution and a parliamentary government. In the carefully planned and executed modernization of the nation's administrative machinery, the primary objective was the achievement of such overall organization as would ensure a high degree of efficiency and a rapid development of industrial and military power. Inevitably emphasis fell on organizational modernization, which influenced only very slightly traditional ideas.

It was natural that the Meiji Constitution of 1889, which clothed Japanese government in Western garb, should have been not an instrument designed primarily to secure the inalienable rights of the individual, but rather a means of achieving national strength and international recognition. Western concepts of liberty and popular rights which were then espoused had been acquired largely out of context and without the benefit of the necessary environment which only working institutions and practices could render meaningful. Traditional ideas and attitudes continued to dominate political thought, unaffected by the remarkable scientific and technological advances which had been attained in the meantime. In fact, old ideas were refurbished to serve the needs of the nation, especially in molding a new nationalism adequate to cope with the rising tide of nationalism of the 19th century world.

See also section on *Development of the Modern State*.

Constitution of 1947.—The Japanese Constitution which went into effect on May 3, 1947 charts in broad outline a democratic political system. As an incorporation of the principles and objectives of the Potsdam Declaration of July 26, 1945, its goal is a peaceful and democratic nation, a political system based on the freely expressed will of the people. Sovereignty is vested in the people: this is a complete reversal of the monarchical principle of the Meiji Constitution and a negation of the traditional theory which held that sovereignty resided irrevocably and permanently in the emperor. The affairs of the imperial household are under the control of the national Diet. The bureaucratically operated authoritarian political system, which was not responsible to the people, has disappeared and the peerage has given way to a system of equality in which no special privileges are permitted. Respect for the dignity of the individual is firmly established in a Bill of Rights which is very specific in its provisions.

With the adoption of legislative supremacy as a basic principle, the Diet has been made the highest organ of the state. Separation of power has been established in substance, while a system of checks and balances has been introduced for the first time, together with such democratic devices as the referendum and recall. The doctrine of judicial review is an integral part of the system in which the independence of the judiciary exists in fact.

In establishing the principle of the supremacy of law, the Constitution of 1947 places legal control over administrative acts through the exercise of judicial power. Formerly the executive branch transcended judicial control and was not subject to any check over its administrative acts. Sanctity of laws has superseded the idea of the practically omnipotent ruler, giving to the Japanese for the first time the principle of "government of laws" instead of the "government of men" which had been their tradition.

Undoubtedly the most unique feature of the Constitution is the provision completely renouncing war as an instrument of national policy. This unprecedented step attracted worldwide attention and has been characterized by some as utterly unrealistic and utopian and hailed by others as a beacon light to the troubled world.

The new constitution of 103 articles is only slightly longer than the old, but, despite the insistence of some Japanese that it is a mere revision, it represents a radical change in substance. The preamble is reminiscent of the Declaration of Independence, the Preamble to the Constitution of the United States, Lincoln's Gettysburg Address, and the Atlantic Charter, all of which inspired those who drafted the constitution. Highly significant is the use of the simple colloquial style of Japanese. The abandonment of the stilted and difficult court style formerly used for decrees and proclamations represents another definite step toward democratization.

National Diet.—As the highest organ of national power, the legislative branch is supreme over the executive. The Diet has become the sole lawmaking organ of the state, stripping the executive of the emergency ordinance powers which it used extensively under the old constitution to the detriment of the legislative branch. Sovereignty used to be vested exclusively in the emperor, who was the source of executive, legisla-

tive, and judicial power; the Diet could not legislate without imperial approval, and the initiative in lawmaking rested with the executive branch.

Under the Constitution of 1947 the Diet not only legislates, but also designates the prime minister from among its own membership and possesses exclusive initiative in proposing constitutional amendments. Fiscal powers, including the power to tax, belong to the lower house, whose approval is necessary for emergency appropriations. Control of foreign relations is also vested in the Diet, and its approval is necessary for the ratification of treaties. Through the exercise of investigative power, control over imperial household property, and the power to impeach judges, the Diet's position is greatly strengthened.

As is customary on the national level, a bicameral legislature is provided, but the upper chamber, the House of Councilors, has become entirely elective. The two houses, however, do not have equal powers. Formerly the appointive House of Peers could obstruct the enactment into law of any bill passed by the elected House of Representatives. Now the lower chamber has superiority over the upper chamber in appropriations and fiscal matters, in foreign relations, and in the selection of the prime minister, and may easily override the actions of the latter. The House of Councilors has no power to do anything about a bill which has been defeated by the House of Representatives. If the House of Councilors should either fail to pass or attempt to modify a bill already passed by the House of Representatives, however, the latter can enact it into law by a two-thirds vote.

Despite the strong powers it possesses, the House of Representatives is subject to dissolution by the Cabinet, while the House of Councilors is not. This provision gives the latter both stability and continuity and, in spite of its relatively weaker powers, it has attracted to its membership persons of experience and prominence largely because of its prestige, which is at least partly a carry-over from the old House of Peers. Of the 250 members of the House of Councilors, 100 represent the nation at large, while the remaining 150 represent the prefectures, each of which has two to eight seats. Councilors are elected for a term of six years, one half of the membership being chosen every three years. The membership of the House of Representatives remains at 466, as formerly, and the members all represent the prefectures, which are divided into one to five election districts, except for Tokyo, which has seven. The term of office is four years, and the entire membership stands election simultaneously.

One regular session of 150 days must be held every year. It usually opens in early December and may be extended whenever necessary beyond the five-month period. Extraordinary sessions are called as needed, the duration being decided each time by both chambers. As a rule, sessions and even committee meetings are open to the public except when secrecy is decided upon by a two-thirds vote. Decision is by simple majority. The lawmaking procedure in the Diet is very similar to that of the United States Congress, as are its rules of procedure.

Executive.—In the administrative branch simplification has been achieved through the reconstitution of executive organs. Gone are the Privy Council, the lord keeper of the privy seal, and

the minister of imperial household, all of whom exerted powerful influence on national policy making as well as on the management of state affairs. As "the symbol of the State and of the unity of the people," the emperor has no powers related to the government and performs only ceremonial functions. The only important executive organ now is the Cabinet, headed by the prime minister, who is chosen by the Diet from its own membership. The premier is required to select at least half of his Cabinet from the Diet. The Cabinet, which is collectively responsible to the Diet, enjoys greater powers than it ever did before. Furthermore, the constitution clearly defines its functions, powers, and responsibilities, which include administration of laws, conduct of state affairs, management of foreign affairs, preparation of the budget, issuance of Cabinet orders, and decisions on amnesties, commutations of punishment, reprieves, and the restoration of rights.

As head of the government and representative of the Cabinet, the premier submits bills and the budget and reports on the state of the nation and foreign relations to the Diet; exercises control over the administrative departments, determines their jurisdiction and powers, and sets aside their acts and orders; acts for his ministers during their absence or holds portfolios concurrently; issues Cabinet orders; and has exclusive control of the office of the prime minister. He is thus the actual head of the Cabinet and not merely a moderator-coordinator.

Several important changes have been effected in the component executive departments of the government since 1945. In late August, immediately following the surrender, the Munitions and Greater East Asia ministries were abolished. The first postwar innovation was the creation, on Sept. 1, 1947, of the Ministry of Labor, designed to achieve the stabilization of national livelihood and social security through labor administration. The most significant of all the organizational changes was the liquidation, on Dec. 31, 1947, of the Ministry of Home Affairs, which had, through extensive appointive and police power and control over prefectural assemblies, imposed the will of the national government upon local political entities and left little room for actual self-government. The abolition of the Home Ministry removed the stronghold of bureaucracy and nerve center of highly authoritarian national government and prepared the ground for popularly based and democratically managed local government. This action was followed by the creation, on Feb. 15, 1948, of the Office of the Attorney General, which superseded the Ministry of Justice. The change effected the complete separation of investigative and judicial functions and a more logical allocation, as well as an expansion, of functions.

The Ministry of Construction was established on July 10, 1948 to take over such functions of the Home Ministry as those pertaining to rivers, public works, city planning, buildings, and construction, particular emphasis being given to the reconstruction of war-damaged areas. On May 25, 1949 the Ministry of International Trade and Industry superseded the Ministry of Commerce and Industry, effectuating a shift in policy from the emphasis on general production to concentrated efforts on the promotion of international trade and, particularly, the production of foreign trade commodities. Last in the series of changes was the splitting, on June 1, 1949, of the Com-

munications Ministry into two departments: Postal Affairs and Electrical Communications. The Cabinet then comprised the following ministries: Foreign Affairs, Office of the Attorney General, Finance, Education, Welfare, Agriculture and Forestry, International Trade and Industry, Transportation, Postal Affairs, Electrical Communications, Labor, and Construction. In 1952 the Office of the Attorney General resumed the name of Ministry of Justice, and the Ministry of Electrical Communications was abolished, most of its functions being transferred to the Ministry of Postal Affairs.

Executive power, formerly supreme, now is not only subordinated to the legislative, but is also subject to judicial review. The police is no longer the strong arm of the executive branch. Nor is executive power bolstered by a special court to handle administrative disputes and render decisions favorable to it, for the Court of Administrative Litigation has been abolished. The power to determine the organization of the executive branch has been transferred to the Diet from the emperor, whose exclusive prerogative it had been. Government officials are no longer the officials of the emperor, to whom alone they were responsible and loyal; they are public servants answerable for their actions to the people through the Diet.

The civil service has been removed from the direct control of the Cabinet and placed in the hands of the National Personnel Authority to insure greater rationality, efficiency, and economy as well as to preclude any sort of spoils system. Grades are based on functions rather than on personal status and rank, and the principle of equal pay for the same work has been adopted. Appointments and promotions are based on competitive examinations. In spite of these organizational changes designed to bring about a democratically controlled administrative machinery, however, bureaucratic-feudalistic attitudes and practices still persist as serious obstacles to the democratization of the political system. The tendency to judge individuals on the basis of former court ranks, service grades, decorations, and the like is still apparent. So are the ideas and attitudes of a considerable segment of the bureaucracy, which reflect their unwillingness or inability to grasp or even to tolerate democratic ideas and processes, their negation or denial of political parties, their persistence in the mystical concept of the state, which they try to impose on the public, and their reluctance to give up the theory of absolute monarchy.

Although the Diet is the sole lawmaking organ, initiative in national policy making is held by the Cabinet, which enjoys the legal right to draft and submit bills to the Diet. The Cabinet has consistently played a dominant role in the constitutional and legal changes effected in the period since the surrender, while the Diet has not asserted by anything approaching vigorous action its right to formulate policies through the law-making process. On the contrary, the lawmakers have deferred their prerogative to the Cabinet by default rather than by delegation of powers.

Judiciary.—There has been a radical change in the administration of justice both in concept and in procedure. Previously resort to law courts was regarded as disgraceful and was scrupulously avoided by the public. Because of traditional biases, the natural inclination of an individual was to avoid altogether the use of the judicial

machinery and to settle disputes out of court. Law courts were seldom if ever regarded as courts of justice. Under the new system the independence of the judiciary has been firmly established, and there no longer exists administrative or executive control of the courts. Furthermore, the democratization of courts and trials which has been undertaken increases respect for individual rights and dignity.

In recognition of the new status of the judiciary, the chief justice of the Supreme Court has been accorded a rank equivalent to that of the prime minister. The doctrine of judicial review gives the court the power to declare laws unconstitutional, making it the guardian of the constitution. An innovation of note in the judicial system is the device of referendum employed in determining the fitness of the judges of the Supreme Court. On the theory that the judges of the highest tribunal must reflect the collective will of the people, the constitution provides that they shall be reviewed "by the people at the first general election of the members of the House of Representatives following their appointment, and shall be reviewed again at the first general election of the House of Representatives after a lapse of 10 years and in the same manner thereafter." If the dismissal of a judge is favored by the majority of voters, the popular mandate must be carried out. In addition, impeachment is provided against judges as well as against all officials.

Of the 15 judges of the Supreme Court, 10 must be legal experts of at least 20 years' professional standing, but the remaining 5 may be learned persons of experience, though not necessarily in the field of law; this permits a democratic representation of expertness. Below the Supreme Court are the eight higher courts, which are regional courts of appeal, and below them are the 48 district courts—1 in each of the 46 prefectures except Hokkaido, which has 3 in order to cover its large area. At the lowest level are the 600 newly created summary courts, with jurisdiction in cases involving not over 5,000 yen. They are designed to simplify legal procedure and to overcome the public dislike of courts as well as the stigma attached to litigation itself.

A distinct innovation is the court of family relations, which was set up on Jan. 1, 1948 to maintain harmony within the family as an institution. The new arrangement is designed to help advance both the dignity of the individual and the equality of the sexes. Matters handled by the 276 courts of family affairs include divorce, breach of promise, alimony, mutual support, guardianship, adoption, property settlement, and the like. After the establishment of these courts, the number of cases brought by women increased greatly.

For the first time a complete separation of criminal investigation and judicial functions has been achieved in Japan. Under the old system the procurators were attached to and subservient to the courts, but now investigations are conducted independently of the courts. Summary punishments, which used to be administered by the chief of a police station and which gave rise to numerous and serious abuses, have been abolished. Both the preliminary investigations and the forced confessions, which were conspicuous features of the old system, are gone. The legal validity of confessions has been greatly reduced,

while habeas corpus as well as the double jeopardy clause have been accepted as an integral part of the judicial procedure.

Local Government.—Local government formerly was no more than an administrative adjunct of the central government. Since the old constitution neither denied nor guaranteed local autonomy, and since it was subject to the vicissitudes of shifting political fortunes, government at the prefectural level suffered from a lack of stability. Moreover, local government was controlled at will by the bureaucracy. The authorities discouraged, if they did not forbid, party politics from the prefectural level downward in order to keep a firm grip on local governmental activities. Consequently, popular participation seldom, if ever, went beyond periodic casting of votes in the national, prefectural, and local elections. Once this was done, local self-government was managed by elected assemblies which were controlled by prefectural governors, who executed orders and instructions emanating from the Ministry of Home Affairs.

It had been the practice for prefectural governors appointed by the Home Ministry to be transferred with each change of government and with only incidental regard for the well-being and interests of the people. Governorships were at best steppingstones for ambitious bureaucrats. Their attitude of superiority, if not of condescension, was reflected in their officiousness and contempt for the people, who knew only the form and not the substance of local government. Moreover, what little semblance of local autonomy there existed was taken away beginning in 1943 by a reorganization which made local entities an integral part of the central government. This was done in the name of all-out prosecution of the war. The central government thereafter became supreme in the sphere of local government, and any pretense of local autonomy was dropped completely.

It was to correct these conditions and to permit greater and direct participation in self-government that the Local Self-Government Law was enacted by the Diet in March 1947. It was clear that the effective democratization of the nation must begin at the grass-roots level. Every possible means had to be utilized to encourage the people to participate in politics by arousing them from political apathy, and to insure a broader base for local government and politics. Decentralization of administration was a necessary prerequisite to the growth of self-government.

The local government system adopted in 1947 provides for the direct election of governors and of mayors of wards, municipalities, towns, and townships. Local government has lawmaking powers, police powers, financial powers (including the power to make public levies in emergencies), and control over education through local commissions elected directly by the people. Twenty-one enumerated categories of powers are exercised by local government, while only eight are reserved exclusively for the central government. Residual legislative powers accrue to the local government. Yet the fact that the drafting of the Local Self-Government Law enacted by the Diet was left almost completely in the hands of the Home Ministry virtually on the eve of its demise, with only a perfunctory, ineffective participation by the Diet, left much to be desired.

Direct measures such as the initiative, referendum, and recall make possible a much greater

participation on the part of the people. The electorate can also demand the dissolution of local assemblies and the examination of records and the auditing of books. In order to broaden the political base the voting age was lowered from 25 to 20 years, women were given equal voting rights, the residence requirement was reduced to six months, and bankrupt and financially dependent persons and charity cases were given the right to vote. By these changes the number of voters was trebled.

Local legislative bodies are unicameral and members are elected for four-year terms. Prefectural assemblies have from 40 to 100 members, depending on the population. The metropolis of Tokyo has a distinctive metropolitan government which is a combination of municipal and prefectural types. The city of Tokyo itself does not have the ordinary type of municipal government; it and the rest of what was formerly Tokyo Prefecture are under a single metropolitan government.

Police System.—The old police system was employed as an effective instrument by the military as well as by the bureaucracy, since the Meiji Constitution enabled the government to exercise police power with great flexibility over all areas of the life of the people. It was for the protection of the interests of the state, and at the expense of individual rights, life, and property, and social security that this power was extensively used, contributing directly to the strengthening and expansion of the authority of the central government. The constitutional rights given to the people could be restricted or nullified by legislation. Freedom of speech, assembly, and association was restricted by police power through the various thought-control laws, of which the best known was the Peace Preservation Law of 1925, aimed at Leftist movements in general and communism in particular. Laws enacted before and during World War II served to tighten further already existing controls over freedom of speech, the press, assembly, and association.

One of the initial acts of the supreme commander for the Allied powers (SCAP) was the abolition, in October 1945, of the special higher police of the Home Ministry, which had been in charge of thought control. Political offenders were released immediately, and the notorious Peace Preservation Law and all other restrictive laws were abolished. This series of measures was climaxed by the abolition of the Home Ministry, bringing the police state to an end.

Police power has been reduced to normal proportions by the delimitation of its scope to the prevention, search, and suppression of crime, and to the protection of life and property. As a result, the police relinquished administrative jurisdiction over matters relating to labor, health, social insurance, and the control of economic matters, all of which were transferred to appropriate administrative departments. Police power has been made subject to the close scrutiny of the regularly constituted courts of law and must be exercised within the specific limits set by law. In keeping with the principle and spirit of local autonomy, as well as with the realization of the highest degree of the dignity of the individual, decentralization of the police has been effected.

Beginning in March 1948, each city or urban section of a town or township with 5,000 or more inhabitants was authorized to maintain a

local autonomous police force under the supervision of a local public safety commission. By 1953, of the 2,303 towns and townships, only 206 still had their local police forces. Of the 276 municipalities, nearly one fifth were leaning toward abandoning their own police forces and coming under the protection of the national rural police, which is under the overall supervision of the National Public Safety Commission, appointed by the premier with the advice and consent of the Diet. In 1952 the premier was given the power to control the nation's entire police force in the event of an emergency. Two years later, on June 7, 1954, the Diet passed a bill abolishing the autonomous police forces and renationalizing all police powers.

Abuses of police power under the new system have been made difficult by the provisions that no one may be detained longer than 72 hours, that the reason for detention must be given, and that the opportunity to secure counsel must be offered. Through the constitutional prohibition of the use of the third degree, police brutality has become illegal. An interesting change has been the appointment of women police officers for the first time in Japanese history, and with satisfactory results.

National Defense.—Demilitarization, which was one of the conditions of surrender in the Potsdam Declaration, had been initiated by the Japanese themselves even before the Allied initial postsurrender policy was effectuated. On Aug. 22, 1945 the Supreme Council for the Direction of War was abolished, and a few days later the Munitions Ministry was also abolished. On September 2—the day of the formal signing of the Instrument of Surrender—SCAP ordered the disbanding of the armed forces by General Orders No. 1. Within a fortnight the Imperial Headquarters was liquidated. Demobilization of troops in Japan proper was completed by mid-October and was followed shortly by the abolition of the army and navy general staffs. The military conscription system came to an end on November 17, and the War and Navy ministries were abolished on November 30. Within three months, complete demobilization and demilitarization had been successfully achieved.

Undoubtedly the most conspicuous feature of the new constitution is the absolute and unconditional renunciation of war as a sovereign right of a nation, thereby outlawing the use of threat as well as of force itself as a means of settling international disputes. The requirement that the prime minister and all Cabinet ministers must be civilians excludes the military from participation in the government. For the first time in Japan's constitutional history, the influence of the military has been removed completely from government.

In spite of the complete demilitarization of the nation provided in the constitution, the right of national self-preservation has been explicitly conceded to Japan. On Jan. 1, 1950, Gen. Douglas MacArthur stated that Japan has "the inalienable right of self-defense against unprovoked attack." In July of that year, following the outbreak of the Korean War, a police reserve was created, and on Oct. 15, 1952, this became the National Security Corps. Chapter 3 of the Japanese Peace Treaty recognizes Japan's right of self-defense, as well as her right to enter into collective security arrangements. On the same day that the treaty was signed, Sept. 8, 1951,

Japan and the United States signed a security treaty. On March 8, 1954, the United States and Japan signed a mutual defense assistance agreement. Three months later, on June 2, the Diet passed bills creating, as of July 1, a new army, navy, and air force. See also section on *Occupation and Foreign Relations (1945-1954)*.

Social Security and Welfare.—The traditional family system, which placed the burden of social and economic welfare of its members on the family, stifled, if it did not prevent, the development of the responsibilities and functions of the state in social security and welfare. As a result, social welfare had come to be regarded as the special province of private charity. The system of social security and welfare provided by the Constitution of 1947, however, guarantees the people "the right to maintain the minimum standard of wholesome and cultural living" by "the promotion and extension of social welfare and security and of public health." Necessary legislation and the organizational framework have been provided to carry out an integrated and coordinated program of public health, public welfare, and social security. An entirely new concept was introduced not only in social welfare, but in civic responsibility as well, when the first community chest campaign was conducted with marked success throughout the nation in the fall of 1947.

Public assistance is now available to those involuntarily in need. Unemployment insurance, health insurance, and welfare annuity insurance help to offset insecurity, while child welfare legislation gives protection to children. The National Disaster Law enacted in October 1947 places the financial responsibility for the relief work necessary in times of natural disaster on both the prefectural and the national governments. Great progress has been achieved in the field of public health, which had lagged far behind the systems of the progressive nations of the West. A systematic and effective program of public education, together with the reorganization of medical education and health facilities, has been instituted. Programs instituted under SCAP supervision for the control of communicable diseases were so successful that the overall death rate for 1948 showed a 53 per cent drop over that of 1945.

Political Parties.—Revival of political parties followed the surrender of Japan by a few weeks. The SCAP directive of Oct. 4, 1945, abrogating and suspending all laws, orders, and regulations restricting freedom of thought, religion, assembly, association, speech, and the press, was the signal for the resumption of political activities, which had been virtually banned during the war. First to reappear was the Social Democratic Party, which was formed on November 2; it was followed by the Communist Party and the Liberal Party within a week, the Progressive Party in mid-November, and the Peoples' Cooperative Party in late December.

The labels of the new parties were of little value in identifying them. These parties actually constituted a revival of old political forces, alignments, and personalities. To be sure, they emerged in seemingly new garb, but old political ties and personal relationships were unmistakably there. The Liberal Party showed a number of familiar faces from the Seiyukai; the Progressive Party drew its membership largely from the Minseitō and the Seiyukai. The Social Democratic Party included the Socialists from

the old Social Mass Party and other groups ranging from the extreme Left to the extreme Right. Somewhat new in appearance was the Peoples' Cooperative Party, drawing conservative support from middle- and small-scale business and industrial elements as well as from the landowners. Its goal has been a working compromise through cooperation between capitalism and socialism. The Japanese Communist Party has been by far the most vociferous and militant political party. It is the only party which derives its policies, inspiration, and support from external, non-Japanese sources and employs tactics abhorrent to the majority of the electorate. However, in the general election of January 1949, it won 35 seats in the House of Representatives by polling close to 3,000,000 votes and also succeeded in placing six members in the House of Councilors. After reaching its peak of power in late 1948 and early 1949, the Communist Party began to show signs of decline largely through the alienation of voters, the public, and even the labor unions. In 1954, however, it still remained a force to be reckoned with, especially since it could become an effective fifth column for the cause of communism.

Postwar governments have all been formed through coalitions of some kind, involving all sorts of political deals. The possible exceptions—if they were really such—were the third and fourth governments of Prime Minister Shigeru Yoshida, which were formed in 1949 and 1952, respectively.

As in the past, political parties are still plagued by internal disunion, resulting in splitting and fragmentation. These parties all suffer in various degrees from inexperience and lack of proper leadership as well as of new blood. Old party men accustomed to old ways of thinking and doing things and bureaucratically trained men with bureaucratic ideas, attitudes, and techniques of handling men and problems occupy positions of party leadership. Political deals are still consummated behind the scenes in the customary manner. Corruption has not disappeared, nor has bossism been removed from every level of politics. Naturally public distrust of political parties is still strong. Political parties which still lack a popular base concern themselves primarily, though not exclusively, with a relentless pursuit for power, constantly maneuvering to gain control of the government. Personalities more than principles influence their decisions and actions. Parties and their leaders must demonstrate their firm grasp of the meaning of democracy, not merely in the abstract but as an attitude of mind as well as a process in the context of Japanese politics, if they are to become an effective force in building a democratic system of government.

12. CHANGING CULTURAL PATTERNS. The broad outlines of Japanese society, as described in the section on *The People*,

have persisted for centuries. The rapid changes since the 1930's, however, invite more detailed description, both of persisting features and of innovations.

Homogeneity.—The striking cultural homogeneity of the Japanese people is no innovation enforced by an adventitious dictator. The stern sumptuary laws of the Tokugawa period (1603–1867) laid the basis of a conformity that still persists. By the 17th century samurai were authorized to behead any civilian whose conduct was “other than expected,” and until 1945 police supervision continued to ensure high uniformity in conduct. Japan's geographical insularity has been abetted by these controls, by a written language that minimizes international communication, and by indoctrination in the public schools. Despite obvious individual differences, every Japanese has resembled every other Japanese much more closely than American or European individuals have resembled their compatriots. Although the stress on democracy after World War II fostered individual differences, Japan's population continues to be less diversified than Occidental populations.

Superficially the smooth channels of etiquette and custom have confined behavior within accepted limits, but the consequent efforts to ensure that everyone conforms to expected conduct have betrayed deep insecurities in personal relations. The pressure to conform has appeared in numberless small items of behavior; common folk formerly bowed abjectly before their superiors and still do so. Even in feudal days, when oppression called forth peasant revolts, no one proposed the abolition of the upper classes, and there was general acceptance of the savage penalties visited on leaders of a revolt. After World War II the people relaxed visibly when police supervision diminished. Were this situation to continue for a generation, Japan's cultural homogeneity could give way to considerable diversity in behavior and personality.

The persisting cultural homogeneity of Japan has been evident in features that have outlived the centuries and that change in form but continue in essence. These include the idea that government is a magical ritual to ensure national welfare—an idea sorely battered by the facts of World War II and thereafter competing with the concept of government as the business of the people; high regard for learning and respect for teachers; glorification of frugality and renunciation of wealth as a criterion of status; family-like guilds of craftsmen and specialists; men's associations, often secret and sometimes actively violent in politics; subordination of females ever since the Buddhist ascendancy of the 9th and 10th centuries; stress on formal etiquette as the technique of social intercourse; emotional tautness that appears both as alertness and as hypersensitivity to insult; freedom from prudery and unemotional acceptance of nudity when dictated by convenience; cultivated aesthetic sensitivity and delicately disciplined manual dexterity; adoration of the scenic beauty of “the land of the gods”; distaste for animal husbandry; seasonal festivals that regulate the peasant's calendar, perpetuate ritual, and afford recreation; houses built on posts with clear space beneath the floor, paper-covered doors, and a place of honor in a guest room; exaltation of the warrior as the social cynosure, and reckless devotion in battle to the overlord—a tradition vociferously

repudiated since World War II; and profound insecurity when confronted by situations not provided for by rule and custom—a corollary to the stress on conformity.

The conservatism inherent in the family organization has preserved these and many other time-honored cultural traits. Although the family organization and its attendant customs have decayed rapidly since the United States occupation, it is too soon to conclude that this trend is irreversible. A characteristic aspect of Japanese cultural homogeneity has been the unanimous and rapid swings of fashion and of political and general opinion from one extreme to another, and this trait may easily reverse many current trends.

Cultural Receptivity.—In contrast with the urge toward conformity, and often in sharp conflict with it, established tradition assumes that desirable ideas and contrivances may be obtained from abroad. Eager borrowing of Chinese cultural patterns from the 7th to the 10th centuries foreshadowed the intensive quest for Euro-American learning and technology in the 19th and 20th centuries. Such avid pursuit of alien culture is unique in history. Wholesale adoption of foreign practices often engenders feelings of inferiority, however, and repeatedly the Japanese have overcompensated for these feelings by feverish attempts to “improve” borrowed ideas and devices and by recurrent waves of hatred of foreigners. Nevertheless, the tradition of selective adoption of exotic ideas has constituted Japan's major cultural asset. It effected a remarkable flowering of civilization that transformed a minor cultural satellite of China into a progressive nation that barely missed the hegemony of Asia.

The traditional openness toward foreign institutions facilitated acceptance of numerous reforms introduced by the postwar occupation, but the usual reaction against an overdose of new practices was gaining headway in the 1950's. The same cultural receptivity also favored rapid expansion of communism; in Japanese eyes, any foreign ideology deserves investigation, even though a period of trial may lead to vigorous repudiation. Both American democratic practices and Communist-Marxist ideology are candidates for this mass acceptance and subsequent rejection. Ultimately such ideological turmoil results in assimilation of some of the foreign ideas and techniques, and Japanese culture manages to preserve its distinctive aspect.

The occupation was unique in Japan's history—not primarily for its military implications, but because it brought large numbers of Japanese into personal contact with foreigners. The social and cultural consequences of this contact are not readily ascertainable as yet, but certain apparently minor cultural innovations, such as the relaxation of formality in social contacts and the establishment of new forms of recreation, may outlast the formal institutional changes that were supported by military fiat.

Simultaneously, the Communists demonstrated that Japanese could challenge the sanctity of their emperor. In practical consequences, this breach with the past may outweigh the military defeat that made it possible. The Communists have busily fomented anti-Americanism, and the effect on cultural innovations attributed to the United States is unpredictable. One clear effect of the war and of Japanese cultural recep-

tivity is the enhanced prestige of American technology and standards of living.

The Family as Model.—The traditional pattern of family organization reappears in larger associations and in the nation itself. Pertinent aspects of family custom include the orientation of loyalty upward toward seniors, parents, and ancestors rather than toward spouses, juniors, or collateral relatives. Transmission of lineage from eldest son to eldest son enhances the status of the first-born male and depreciates that of junior siblings and females. By law and custom ties of descent outweigh the bonds of matrimony. Formerly marriage contracts were entered into by the house, not by individuals, and a son's wife was called the bride of the house. Younger sons normally have left the house to seek independent careers. In theory they still support the house financially and submit to the family council, and in illness or hardship they may receive succor. This displacement of junior sons—and, in modern times, of unwed daughters—combined with the transfer of married daughters to other households, underlies many unique aspects of Japanese society.

Family interests appear also in the pervasive etiquette of face—that is, protection of family status and dignity against a hostile world. Although emphasis on face has declined, especially in the rearing of children, a child still knows that his misconduct may lose face for the house. Before World War II scarcely a year passed without newspaper reports of suicide by a small child after a reprimand at school. Teachers often said that it was better to promote all pupils in a class than to risk face for some family. Etiquette supports polite fictions (*yūmei mujitsu*) that protect families from public exposure of their weaknesses.

In feudal times social organization was patterned strictly after the extended family. Even in the modern period it has been customary for travelers who hail from one's ancestral *kuni* or ancient province to expect and receive the hospitality accorded to relatives. Political alliances and rivalries often have stemmed from loyalty to the old-time *kuni*. Organs of local government, committees, industrial combines, professional associations, and, in theory, the nation acknowledge the familial pattern of human organization and determine their policies much as family councils arrive at decisions.

Typical of the infusion of family concepts throughout Japanese social organization is the institution called *oyabun-kobun*. This is a ritual pseudo kinship that appears in labor groups, craft associations, political parties, professions, and racketeering. An occupational or other group centering in a vested interest sanctioned by custom often assumes the form of an extended family. Members, not blood kin, nevertheless assume ties that bear kinship designations, and within the framework of the association treat each other as kindred. The head of the organization is addressed as *oyabun*; *oya* means "parent," and the suffix *-bun* (sometimes *-kata*) distinguishes these terms of pseudo kinship from the otherwise identical terms of family affiliation. Protégés and subordinate members of the pseudo kindred are addressed as *kobun*; *ko* means "child." There may be a ritual grandfather, uncles, elder and younger brothers, and grandchildren—all addressing each other by the appropriate kinship terms carrying the suffix *-bun*.

The initial organization of an *oyabun-kobun* group includes a ceremony in which the members pledge filial and fraternal loyalty by drinking sake to which salt and a bit of fish have been added to symbolize blood. Usually the group assumes a "family" name, and *kobun* may wear jackets bearing this ritual name. The *oyabun* obligates himself to aid his *kobun* in obtaining vocational training and in finding employment, and provides loans when needed and care in illness. In turn, the *kobun* are expected to aid the *oyabun* in retirement and to provide for his funeral.

Family solidarity and social stability formerly centered in the ownership of real estate and other property by the house; the current head served as a sort of trustee. Normally he retired sometime after reaching the age of 50 in favor of his eldest son or heir. A last will and testament was superfluous, and the death of a retired head rarely occasioned redistribution of property. If the heir was a minor, the family council appointed an acting head. Consequently, testamentary problems received slight attention in Japanese law; the durable issues centered in problems of inclusion in, or exclusion from, membership in a house, and in succession.

All this was upset by new inheritance laws promoted by the postwar occupation. American concepts of individual ownership and disposal of property by a will were embodied in laws working to disrupt the traditional family organization. Brothers and sisters now inherited equally, and family property thus became subject to dispersal whenever the head of a family died. In litigation the emphasis shifted to problems of inheritance and allotment of individual shares in property formerly held by a family. If these laws continued in force, radical changes in the family system would be inevitable, and Japanese social organization might adopt new patterns and shift away from the *oyabun-kobun* model.

Country and City.—In the 20th century divergence of urban and rural populations has threatened the homogeneity of Japanese society. In earlier times Japan was notable for its simple feudal dichotomy of helpless peasants and military overlords. As elsewhere in southern and eastern Asia, the peasant who raised wet rice was tied to his paddy and hamlet. He lacked the means of broadening his horizon and resignedly accepted the inscrutable vagaries of flood, drought, typhoon, earthquake, civil war, and government. Over tangible issues such as land rent and water rights he flared into violence, but the hills that furnished his precious water circumscribed his imagination.

Urban life, however, was no novelty in Japan. There have been cities for a dozen centuries. Their luxuries were formerly obtained at the peasant's expense, but modern industrial urbanization has achieved a measure of independence from the local agrarian economy. In the late 1930's frenzied preparations for war accelerated the concentration of industry, and the cities grew explosively. From the 1880's to the 1930's the rural-farm population continued stable at 35 to 40 millions, the farms were saturated, and the population increase was accommodated in the cities. World War II drove many city dwellers back to the farms, however, while other urbanites moved to suburban fringes away from the bombed-out centers and thereby seriously reduced the effective area of cropland.

Meanwhile, a startling agricultural revolution, based on the intensive education of farmers in scientific agriculture, gained momentum beginning in the late 1920's. Scientific techniques thus diffused among farmers include precise knowledge of fertilizers—animal, chemical, and vegetable; knowledge of the uses of hybrid seeds; pest control; minute attention to soil chemistry; control of plant diseases; and ingenious mechanization of many farm operations. Threshing, formerly done by flails, is performed by foot-power machines of Japanese invention; the laborious hand manufacture of the indispensable straw rope has been replaced by a footpower machine that turns out better rope in a fraction of the former time; and rice is ground or hulled in power mills. Electricity has become available in most rural districts, and many farmers own small internal combustion power units. Since the mid-1930's increased productivity of cropland has permitted farm population to increase, even as rural standards of living have risen. Land tenure reforms initiated by the occupation, abetted by inflation and black markets for farm produce, have cut sharply into farm tenancy and farmers' debts.

Consequently, by the mid-1950's the farmers in many parts of Japan had begun to approach urban standards of living. Their diets had expanded to include canned foods, bread, candy, and other luxuries. Universal schooling had equipped farm people to acquire scientific knowledge, to read newspapers and magazines, and to take advantage of the general availability of radio sets to keep in touch with the outer world—especially to keep posted on markets. Small factories close to farm villages offered part-time employment to members of rural households and provided many families with cash.

Since urban populations have been recruited from junior sons and daughters whom rural homes could not accommodate, the cities include millions of individuals whose old family ties are tenuous and whose outlook is congenial to innovation. Urban workers, however, often maintain one tie to their rural kindred: during the economic stringency of the 1930's unemployed workers returned to the ancestral villages to share the meager fare of their country cousins. Similarly, during World War II urban refugees dispersed to live with rural kinsmen until cities once more became habitable. Such emergencies impose a heavy burden on the peasants' strained resources—a burden mitigated in postwar years by black-market prices for foodstuffs that brought cash to the farms. Given a stable economy free of depressions and wars, however, the gap between peasant and city dweller might continue to widen along lines evident before 1930.

The widespread Asian tradition that land is the safest investment persists despite the development of a capitalist economy. In an overpopulated country this kind of investment quickly forces land prices far above the level of profitable farming. Peasants fall into debt, good land is concentrated in the hands of landlords who do not understand farming, and the wastes and human misery of tenancy multiply. A further threat to Japan's rural population inheres in the failure to divide the tax load equitably between industry and agriculture. Prior to World War II, Japan's entire economy involved hidden dependence of "modernization" upon the farmers and fisherfolk. Tax-subsidized heavy industry,

plus governmental bureaucracy, plus armament costs imposed a crushing burden on the farmers. Some redistribution of the tax load occurred during the occupation, but fundamental reforms have continued to be postponed, and farmers speak of the future with deep misgivings.

City and country alike manifest certain far-reaching social changes in the status and behavior of women. The woman's movement, which had its roots in the democratic enthusiasms of the early 1920's, was carried far toward fruition by the postwar reforms of the 1940's and early 1950's. Women's societies are universal. During World War II they were drawn into the net of governmental organization in patriotic endeavor. Since the war they have followed the lines of development familiar to Americans and to many north Europeans. Women speak out in political matters as never before, and a notable increase in educational facilities for women contributes richly to the new public spirit.

The new outlook of women has been accompanied by a whole series of innovations in infant care and child-rearing practices. Improved access to physicians and the scientific training of midwives have combined with the wide reading of baby-care books to revolutionize the early months of life for millions of Japanese. As these babies mature and assume responsibility, their generation may conceivably accept goals and values that have not been congenial to their forebears. The numerous inexpensive magazines for women exert great influence, continually diffusing new methods of homemaking, cooking of novel dishes, child psychology, Occidental fashions, and diverse points of view concerning women's status, sex, politics, and the technology of domestic life.

Sheer physical changes in Japanese cities facilitate changes in living habits. Playgrounds, parks, and public recreation facilities; public water supplies, gas, electricity, and cheap rapid transportation; and, above all, the endless variety of goods on display in both old-style shops and luxurious modern department stores—all these combine to render impossible the return to ancient patterns of living. Japan's cities, prior to World War II, had approximated the appearance and the animation of Occidental cities. The devastation that razed much of their area during the war proved a boon from one point of view; it suddenly became possible to substitute wide, straight boulevards for narrow, winding streets, to make room for parks, and to improve transportation. On the whole, most cities took full advantage of these opportunities, and the new physical aspect of urban Japan carries few hints of the ancient Orient. People who ride in subways, live to the blare of radio and television, read books of every country in translation, grow up on paved streets and find their pleasure in theater, dance hall, night club, ball park, or race track can reconstitute the social forms of the past only in sentimental pretense, never in reality.

So, like all great cities, those of modern Japan provide advantages for their denizens and also expose them to specific dangers. Ancient customs lose prestige, and demagogues can sweep urban crowds into fantastic hysterias. On the other hand, the Japanese have learned that in modern war cities are fatally vulnerable, and that even in peacetime employment may be irregular and security precarious. Stable marriage and parent-child relationships are undermined by a

bewildering variety of superficial secondary contacts, with a consequent increase in divorces, suicides, and crimes. Through mass-communication media foreign customs and ideologies are adopted overnight, and are as speedily forgotten.

Ever since the opening of the 17th century, Japanese society has been tightly organized on a class pattern, and even after the restoration of 1868, four distinct classes—nobility, gentry, commoners, and 'new commoners'—were recognized and everyone had to state his class when he filled out legal documents, police records, school certificates, or similar formal papers. This simple scheme has not survived the changing needs of an increasingly industrialized, bureaucratically ruled society in an urban setting. The formal abolition of class distinctions occurred in the 1930's in the course of the egalitarian movement incidental to the prewar totalitarian, militarist enthusiasms. The obsolescence of formal social classes occurred not through democratic, but through antidemocratic, influences. Nevertheless, the success of this attempt to fit the nation into the egalitarian formula of totalitarianism was possible because economic status, skill, occupation, learning, military rank, civil service grades, and differences in income already had reduced the four-class system to a meaningless rubric. Sensitivity to differences in social status, and to the differences embodied in the obsolete class system, however, persists rather conspicuously in the social behavior of most individuals.

Etiquette and Morals.—The entrenched regard for social class attained explicit formulation in the language and etiquette of Japan, and despite a notable relaxation of the rules of etiquette and a corresponding simplification of language after World War II, the traditional patterns have not vanished. The phenomenon of a divine upper class which must be addressed in special words is found again and again in southern and eastern Asia, and perhaps the closest parallel to the traditional Japanese usages occurred in Polynesia. The Japanese language comprised several languages in one, each adapted to addressing persons of social status above or below that of the speaker.

This linguistic etiquette symbolized the entire pattern of social relations. Quite in the Confucian mood, one has needed to know one's own position in relation to the status of everyone encountered, and has governed social contacts in accordance with the rigid patterns thus indicated. Traditionally, introductions are performed only if both individuals desire to meet, and the ritual of presentation amounts to self-introduction. The nearest equivalent to the Occidental handshake is the deep bow from the hips; this gesture of courtesy upon meeting is not optional, as is the handshake, but marks every meeting, parting, or expression of courtesy.

The assumption of humility toward equals or superiors is fundamental, together with a degree of arrogance, however restrained, toward inferiors. One's own family and possessions are deprecated, while the use of honorific linguistic forms indicates the person or possessions of another. One compliments another person by calling at his home, but in the mood of humility refrains from inviting others to one's "mean abode."

In the mood of the basic Confucian relationships, most Japanese are involved in complex patron-protégé situations. In social or business

contacts one normally relies on a guarantor (*hoshōnin*) who prepares introductions and negotiations in advance and mediates divers transactions. For example, in filling an important post an employer deals with a trusted acquaintance who proposes and vouches for a prospective employee. The latter would not dream of any breach of trust that would lose face for his sponsor.

Etiquette merges indistinguishably with moral standards. It was taught of old—and indeed until 1945—that the ordinary Japanese owed his very existence to ineffably glorious, supernaturally endowed overlords, even as he owed his bodily form to his parents. Thus he was born under obligations that could be acknowledged but never could be repaid. One receives *on*—the beneficence of emperor, parent, overlord, teacher, or patron—and owes *gimu*, an obligation or liability that under the old code must be kept constantly in mind. It was taught that the *gimu* of loyalty due the emperor could not be repaid, not a ten-thousandth part of it, even by death in battle. *Giri*, on the other hand, denotes the obligations that one incurs and repays in the normal reciprocities of living. *Giri* is the sense of propriety that prompts one to offer a return gift, to work for a neighbor who has rendered assistance, to avenge an insult, or to perform duties to relatives. Maintenance of face depends on sensitive awareness of *on*, *gimu*, and *giri*; the comment *giri wo shiranu* (he does not know *giri*) may imply moral deficiency as well as ignorance of manners. Benefaction, loyalty, reciprocity, duty—a household is judged and accorded neighborhood status in these terms. But the old traditions lose force in the cities, and many young people ignore them.

Integral in the patterns of etiquette and morals are aesthetic ideals such as the goal of sophisticated simplicity in the arts. The relative absence of furniture in a typical Japanese home exemplifies this ideal. A guest kneels on the thick straw floor mats and sits back on his crossed feet; politely he defers acceptance of a proffered cushion and resists the host's urging to move toward the place of honor. Meals are served with due regard to aesthetics; the little dining tables are about a foot high, while the lacquered bowls and porcelain dishes are arranged tastefully on lacquered trays to display the colors and textures of the foods. Rooms are not adorned with pictures or bric-a-brac; usually a single long scroll painting graces the place of honor, and this probably has been changed just before the arrival of an expected guest. If the guest is skilled in the social graces, he will notice the picture, interpret the literary or other symbolic allusion, and thereby compliment his host. Such complex rituals of etiquette as the famed tea ceremony are charged with moral, aesthetic, and religious significance. On the whole, the urban younger generation exhibits considerable ignorance respecting traditional etiquette, aesthetics, rituals, and folklore.

Obsolescence of Handicrafts.—The displacement of handicraft production by factory-centered technology, well under way in the 1920's, was accelerated tremendously by World War II. Formerly every locality proudly displayed and sold its *meibutsu* or local product, and most goods used domestically came from handicraft technology. Many craftsmen were organized into guilds that maintained unity by rituals and rules enforced on members. Quite generally the technique of production was dramatized and kept uni-

form by chanted rituals that sometimes required the specialized knowledge of a Shintō ritualist. The war changed all this. Craftsmen were drafted into factories in which their special skills supposedly would count, tools were remelted, and other equipment was dismantled. Very few of the traditional handicrafts remained by the 1950's.

Recreation.—The idea of regular vacation periods was adopted into Japanese culture from Euro-American sources in the 1920's. Previously rest days had been limited to the 15th and final days of each month, to seasonal festivals like the cherry-blossom holidays in spring, the New Year, and celebrations at shrines and temples. Pilgrimages, nominally religious, were prolonged picnics at holy places, shrines, and spots renowned for natural beauty. Recognized vacation areas other than hot springs came into vogue in the 20th century, and national parks were established after 1930.

The ancient nobles enjoyed trials of skill such as archery, a form of football, and military exercises, as well as aesthetic rituals like the tea ceremony and incense-smelling contests. Modern popular sports incline to mass spectatorship at baseball games, all sorts of track races, *sumō* (a kind of wrestling between specially nurtured giants), sword or fencing practice called *kendō*, and *jūdō* or *jūjitsu*. *Kendō* and *jūdō* differ in psychology from Occidental sports; their exponents regard them as preparation for deadly combat without quarter. Prior to and during World War II all Occidental sports were discouraged, and some of them prohibited, on the ground that they did not prepare men for victory in combat. Since the war all of the banned sports have been resumed enthusiastically.

Many Japanese devote time to a decorative garden, the care of dwarf trees, and the making of tray gardens, or to more active pastimes such as hiking and mountain climbing. Women practice flower arrangement. Such activities include religious and aesthetic values in addition to recreational aspects. Calligraphy, the composition of tiny poems, the mastery of an ancient dance or song, and the practice of a skilled craft combine hobby, recreation, and art in a uniquely Japanese fashion. Among hobbies borrowed from the Occident, photography probably occupies first place; ham radio, philately, numismatics, and the collection of books, antiques, and phonograph records all claim devotees.

Japan's assimilation of Occidental music constitutes a striking cultural transformation, for Occidental music and Japan's traditional music are almost totally incommensurable. The ancient types of music survive, but much folk music follows Western patterns. The people sing folk songs of every nation, dance tunes, opera arias, and the latest jazz. When a symphony concert is broadcast, it is an unusual group of listeners that does not include someone who can identify Occidental works by name and composer.

The cinema appeared in Japan almost as soon as it spread in the Occident. Foreign films are popular, and Japanese producers turn out films that win audiences abroad despite the handicap of language.

13. RELIGION. Religion in Japan today means primarily the three recognized religions—Shintō, Buddhism, and Christianity. Prior to about 1900, Confucianism was the third religion, instead of Christianity. The role these religions have played in the life of the Japanese is seen best when presented historically. Japan's religious history may be divided into seven periods:

(1) Prehistoric and semihistoric, ending in the 6th century A.D.

(2) Early Buddhist, 6th to 8th century, in which Buddhism was introduced and was accepted primarily as the vehicle of the higher Chinese civilization.

(3) Heian Buddhist, 9th to 12th century, when Buddhism, together with other elements of Chinese civilization, became an integral part of the religious and cultural life of the upper classes, while Shintō remained predominantly the religion of the masses.

(4) Indigenous Buddhist, 12th to 16th century, when Buddhism with marked changes became the dominant religion of all classes.

(5) Period of the regimentation of all life, including religion, in the interest of a police state, 16th century to 1868. Buddhism remained the dominant religion but lost ground to neo-Confucianism and reascent Shintō. Christianity flourished for a short time, only to be rigorously suppressed.

(6) Period in which religion was an instrument of an expanding state (1868-1945). Shintō, Buddhism, and Christianity were regarded in varying ways as of possible service to the state but were circumscribed in their activities, while State Shintō was sponsored as a cult of patriotism superior to all religion.

(7) Post-World War II.

Prehistoric and Semihistoric Period.—The religion of the early Japanese was primarily a naive nature worship to which was added, possibly under Chinese influence, a form of ancestor worship. The objects worshiped were designated by the term *kami*, meaning "above" or "superior." Any object or natural phenomenon giving rise to a feeling of wonder, awe, or fear was regarded as a *kami*. The most widely worshiped *kami* were the sun, moon, mountain peaks, streams, waterfalls, and devastating storms, but innumerable other objects such as large trees, stones of peculiar shape, certain animals, and even insects were worshiped.

The *kami* concept naturally underwent some changes in meaning as the Japanese gradually emerged from their primitive state. We can distinguish roughly three levels in this early period. There is first the preanimistic conception by which the natural object or phenomenon is worshipped as such without the worshiper formulating

any definite idea about it. This holds true especially for such awe-inspiring objects as the sun, majestic mountain peaks, or the terrible storms. The second level is typical animism, in which certain objects or natural phenomena are seen as controlled by some indwelling spirit, good or evil, which must be worshipped or propitiated. On the third level the innumerable nature spirits are made over more and more into the image of man himself, and thus we get the familiar gods and goddesses of polytheistic Shintō with its growing mythology. On this third level of Japan's early religion appears a form of ancestor worship—that is, the dedication of clan chieftains, heroic warriors, benefactors, and ancestors. The two lines—the nature spirits and the deified humans—were then more or less merged, and we see the picture of early Shintō's *yao-yorozu-no-kami* (800 myriads of gods).

This development of the *kami* concept took place apparently before the early Japanese came consciously under the influence of the more mature religions of China. Japan's oldest literary records, the *Kojiki* (712 A.D.) and *Nihon Shoki* (720), reflect this type of religion. At the same time, however, they show how the unorganized and primitive nature and ancestor worship was being more or less organized into a system called Shintō, a Chinese term meaning "way of the gods." In these records we find a crude theogony and cosmology. There are two major groupings of deities: the seven generations of celestial deities, and the subsequent terrestrial deities. Prominent in the first group are deities representing creative or productive powers such as the high-producing or the divine-producing deity. The last pair of the celestial deities, Izanagi and Izanami, produce the Japanese archipelago and various lesser objects of nature. Izanagi alone begets Amaterasu-ōmikami, the Heaven-Shining Great Deity, and Susa-no-wo, the Swift-Impetuous Deity, or Storm God, the former standing increasingly for enlightenment and all that is good, and the latter for the forces of violence and evil. This nascent dualism was never developed, probably because of the overpowering influences of Chinese civilization in the subsequent period.

The Sun Goddess, Amaterasu, originally a major nature deity worshiped by all the clans, was recast at the dawn of history as the divine progenitor of the ruling family. Each clan had its own clan deity, *uji-gami* with the clan chieftain, *uji-no-gami*, serving as high priest, and, as such, regarded as semidivine.

The shrines of early Japanese religion were at first objects and places which called forth a feeling of awe and wonder. Then, simple structures of wood or stone were erected to house the object in which the spirit was believed to dwell. Such objects were called *shintai* (god body). The most famous of them were the three insignia of imperial authority: the sacred mirror, the curved jewel, and the sword.

The good-life ideal was conceived largely in terms of the physical. The gods received in sacrifice the kind of things the pious devotee expected of them in return. Ethical and spiritual elements were present only in a rudimentary form. There is also very little regarding man's ultimate destiny. The early records speak of a realm of gloom, and the gods are pictured as descending from the heavenly realm, but there is little in the way of giving man hope in a life after death. Possibly, however, there was more

than appears in the records, and it was forgotten as the early Japanese turned to Buddhist teachings about the individual's destiny.

Early Buddhist Period (6th to 8th Century).—Buddhism reached Japan first by way of Korea in 552 A.D. To gain help against his rivals, the king of Paekche sent to the Japanese court a mission which included Buddhist monks. Among the gifts they brought were Buddhist scriptures, a Buddhist statue, and various ceremonial objects. An accompanying letter recommended Buddhism as "the most excellent of all teachings," and explained that it was generally accepted in all countries from Korea to India.

A great controversy soon developed, some Japanese advocating acceptance of the new religion, while others bitterly opposed it. Within a few decades, however, Buddhism gained a real foothold, and when the prince regent, the famous Shōtoku Taishi (r. 593–621/622) began sponsoring the new faith its future was assured. In an edict he urged his people to "sincerely reverence the Three Treasures (Buddha, the doctrine, and the order)," for these "are the refuge of the four classes of living things and are in all countries the supreme object of faith." In thus sponsoring Buddhism, Shōtoku Taishi set an example which subsequent Japanese sovereigns usually followed. The prince himself was well versed in Buddhist lore and gave lectures on certain Buddhist texts. Of greater consequence, however, was his establishment of direct connection with T'ang China in order to learn more about the new religion and the higher Chinese civilization. In fact, Buddhism gained its first ascendancy in Japanese life because of what it brought in its train as the vehicle of Chinese civilization. Buddhist monks transmitted in ever-increasing volume much of Chinese literature, art, architecture, medical lore, and various crafts. Great temples, monasteries, hospitals, and asylums were established. The Buddhist ideal of the unity of all life was a factor in the Taikwa (Great Reform) of 646 which reshaped Japan's political structure on the Chinese administrative pattern. Even those loyal to the native faith showed the influence of Buddhism in their organization of the innumerable local cults into a sort of system, with the Sun Goddess given greater prominence as the divine ancestress of the ruling family. The naive legends and mythologies were arranged into a kind of history by following the Chinese model.

The influence of Buddhism is perhaps best seen in connection with Japan's first real capital city, Nara, which was patterned after the Chinese capital, Changan. With its great temples and monasteries it grew into a city of real magnificence. The gigantic bronze statue dedicated to the Buddha Vairocana (Vairocana), known in Japanese as Dainichi (Great Illuminator) and declared to be one with the Sun Goddess, prepared the way for reconciling the claims of the two religions. To be sure, the vast majority of the people continued to worship their local Shintō deities, but many, especially in the capital and in some of the provincial centers where Buddhist temples were being built, came increasingly under the sway of Buddhist teachings.

Six different schools of Chinese Buddhism found their way into Japan during this period. In varying ways they accustomed the Japanese to think in terms of universal concepts. The Buddhist conception of the divine, of man as a citizen of eternity, the ministry of mercy as ex-

pressed in the Bodhisattva ideal, and the general ethical teachings of Buddhism were all of them far more satisfying than what the old faith had to say on such matters.

Heian Buddhism (800-1200).—The removal of the capital in 794 to Heian, later called Kyoto, marked a change in the religious situation. The very word *heian*, which means "peace and tranquility," expresses the Buddhist ideal of life. Whereas in the preceding period Buddhism had been propagated largely by foreign missionaries, now the work was done almost wholly by Japanese who had studied at Buddhist centers in China or at great centers of Japanese Buddhism as these developed, especially at the Tendai establishment on Hieiizan, near Kyoto. Two monks in particular helped to usher in this new period: Saichō (767-822), better known by his posthumous name of Dengyō Daishi; and Kūkai (774-835), the famous Kōbō Daishi. In 804 they had as young monks accompanied a government mission to China, and after a few years' study on the mainland, they returned to Japan bringing with them new forms of Buddhism.

Dengyō Daishi studied at the great center of T'ien-t'ai Buddhism, a type most comprehensive in its teachings, and he founded in Japan the Tendai sect, which subsequently played an important role both as one of the two major sects during this period, and later as the source of new sects. Dengyō was faithful in transmitting to Japan the all-inclusive Tendai type of Buddhism, which tries to find room for all the varied teachings of the voluminous Buddhist canon. Nevertheless, he felt that the great essentials of faith were best formulated in the famous Lotus Sutra (*Saddharmapundarikasūtra*; in Japanese, *Myōhōrengekyō*), which glorifies the historic Buddha Śākyamuni as the eternal Buddha. In this view, although the eternal Buddha as absolute being transcends man's comprehension, for practical purposes a religious man may think of Buddha in terms of ideal personality. The eternal reveals itself on different levels and thus fills the needs of finite man. This conception made room for whatever truth there was in other religions, even for the crudities of Shintō. In Dengyō's Buddhism there is also a place for different ways by which man can be saved—the hard way of moral discipline, in which man works out his own salvation; the way of philosophic insight into the truth; and the way of faith and simple trust in the mercy and grace of the eternal Buddha.

Kōbō Daishi, trained for an official career, had studied Confucianism. He also investigated Taoism, but was finally converted to Buddhism. Truth was to him a matter of varying degrees and so he arranged what he had found in his studies in an ascending scale with Buddhism at the top, and with a particular form of Buddhism found in the Chinese Chên-yen school as the most excellent of all. This type he introduced into Japan under the name of Shingon (true word) or Himitsukyō (secret teaching). Kōbō, like Dengyō, had much to say about the eternal Buddha, especially Dainichi Nyorai, the Great Illuminator, but less about the divine as personal. According to Shingon, Dainichi Nyorai is the central sun from which all truth radiates. The many rays are the fragmentary truths seen by different finite minds. Just as these rays radiate in various and even opposite directions, so man's half truths and even contradictory views may each have its place and meaning. Not only is there room for

the wide variety of partial truths found in Buddhism, but also for the naive views of Shintō. It was Kōbō's system which more than any other supported that syncretism of the two faiths which prevailed down to modern times.

The eternal Buddha is also represented as the source from which all things emanate so that "in every particle of dust" may be found the nature of Buddha. How much more, then, is man in his inmost nature an offspring of the eternal. He therefore can become one again with the eternal in spite of all his frailties and evil. Sometimes this view of man's nature and his possible destiny found worthy expressions in Kōbō's system, but frequently there is reflected too much of the degenerate type of Indian Tantric Buddhism which makes room in religion for anything man desires. Very little of the moral seriousness of original Buddhism remains and Shingon (true word) becomes the "magic word" which combines a fantastic idealism with the grossest form of materialism.

In one form or another, Buddhism became dominant in the life of the upper classes. Japanese sovereigns continued to support the imported faith, and some of them became monks themselves upon abdicating, taking the title Hō-Ō, or king of the law (of Buddha). Such abdications were often forced, but nevertheless the step taken was represented as honorable. The elaborate Buddhist ceremonials invaded the court ceremonies and added to their splendor, and Kyoto became a city of great magnificence with numerous temples and religious institutions, many of them examples of the best in architecture and filled with fine paintings and sculpture. Serious literature was almost wholly Buddhist, and even such as dealt with secular subjects reflected the Buddhist view of life. In spite of this outward splendor, however, the inner life was not correspondingly rich. In fact, there was often an emptiness stemming from an awareness of the fleeting character of all earthly things, without the real assurance that mortal man could become a citizen of eternity, a conception which Buddhism was supposed to stress. Moreover, the all too facile compromises with Shintō and the religion of the masses left many Buddhists religiously illiterate.

There were, nevertheless, minor movements preparing the way for a type of Buddhism which had real vitality and meaning for the common man. This was especially true of the *Ōjōyōshū* (*Essays on Birth into Paradise*) of Genshin (Eshin, 942-1017), and the preaching of a few others about the eternal Buddha Amida and the way of salvation through faith in his mercy and grace. This teaching was not wholly unknown in Tendai Buddhism, but Genshin lifted it above the many other teachings and gave it prominence. Its real significance appeared with the rise of the great Amida sects in the following period.

Indigenous Buddhism (1200-1600).—The tremendous changes in the political life of Japan during the latter half of the 12th century affected the religious situation and opened the way for new and more popular forms of Buddhism. Three new types developed and became more or less dominant throughout the land.

First in time and in its continuing influence is Amida Buddhism with its two major sects, Jōdoshu and Jōdo Shinshu, founded respectively by Genkū, known as Hōnen Shōnin (1133-1212), in 1175, and Shinran (1173-1262), in 1224. Hōnen had been a studious monk of the Tendai

sect, poring over the voluminous canonical scriptures without finding actual peace of mind until he read Genshin's *Ōjōyōshū*. Then he saw that the heart of Buddhism was the prayer *Namu Amida Butsu* ("I worship thee, Amida Buddha"). "When we invoke Buddha and say '*Namu Amida Butsu*' with the firm belief that we shall be born in Buddha's paradise, we shall surely be born there." To his friends, who were perplexed by a profound scholar's giving such a simple interpretation of the essentials of Buddhism, he replied that if he knew anything more profound and withheld it from others he would be forsaken by the "two lords"—the eternal Buddha Amida and the historic Buddha Sākyamuni, regarded as the one who taught about Amida.

Hōnen's simple gospel was heard with joy by all classes of society. Court circles and upper classes whose world was crashing with the decline of imperial power found hope in his message. Military classes, sickened by the horrors of civil war, longed for the peace of Amida's paradise. The common people, so little touched by the older forms of Buddhism, felt that this was a message for them.

Among Hōnen's numerous disciples was Shinran, who, with all his admiration for his teacher, felt that there was still too much emphasis on the old "save thyself" doctrine in the endless repetition of Hōnen's simple prayer. He also felt that religion should be less confined to temples or monasteries, and instead should express itself in the normal life of man. In place of celibacy and the ideal of the monk, he advocated marriage and family life. Thus Buddhism, which had usually been otherworldly in emphasis, became in Shinran's 13th century Japan a religion for citizens of both this and the next world. Although Shinran and his followers were accused of making salvation a bit too easy and the religious life altogether too normal, his Buddhism not only won a great following in his day, but has held its own and still shows great vitality.

Differing greatly from Amida Buddhism is Zen Buddhism, introduced from China by two Japanese monks who had studied at Chinese centers of the Ch'an sect. In 1191 Eisai (1141-1215) introduced the Rinzai sect, and about 1244 Dōgen (1200-1253) introduced the Sōtō sect, of Zen. Zen (Sanskrit *dhyāna*) means "meditation," and it is through deep meditation that man is to realize his essential identity with ultimate reality. The multiplicity of the phenomenal world with all its distracting details, when illumined by the light of the eternal, takes on new meaning. What man obtains through an intuitive insight into truth and the real nature of things cannot be expressed in intellectual concepts, for the deepest truth is "the white silence of truth." Where Eisai stressed the mystical experience and intuitive insight into inner reality, Dōgen placed greater emphasis on what is ordinarily regarded as practical and made more room for thought. Both types of Zen appealed peculiarly to the soldier class, probably because they found in Zen primarily a method of self-discipline and self-assurance, so important in meeting fearlessly the vicissitudes of the battlefield. The characteristics of Zen discipline are the quiet retreat, proper bodily posture, correct breathing, concentration of thought on a given problem expressed often in paradoxes, the intuitive grasp of the truth, momentary ecstasy, and the sense of oneness with the ultimately real.

The third type of Buddhism appearing in 13th

century Japan was the Nichiren sect, taking its name from its founder Nichiren (1222-1282). Nichiren had been a monk of the Tendai sect, and he felt that it was time to protest against the Amida and Zen teachings. He sought to restore the pure teachings of Dengyō Daishi, based on the great Lotus Sutra. Japan was then threatened by the Mongols and to meet this danger the country must be united in religion. Unity in religion to him meant loyalty to the historic Buddha glorified as the eternal Buddha in the Lotus Sutra. This loyalty was being undermined, he insisted, by the new sects which talked so much about Amida Buddha and by the vagaries of Zen mysticism. Thus, in Nichiren Buddhism religion and loyalty to one's country had become one. This is a major reason why it made its appeal to Japanese. Nichiren's belligerent spirit, which brought him into conflict with the authorities, seemed contrary to the spirit of true Buddhism which he claimed to champion. And certainly many of his fanatical followers, with their blind worship of the Lotus Sutra while ignorant of its content can hardly be regarded as true representatives of traditional Buddhism, which has usually stressed enlightenment and intellectual tolerance.

All three types of Buddhism flourished during this period. Amida Buddhism with its heavenly paradise presented its message through art and a literature that made its appeal to all classes. The gigantic bronze statue dedicated to Amida at Kamakura about 1252 was a vivid reminder of the Buddhist ideal of calm and eternal peace. This message became all the more meaningful during the incessant civil wars which lasted from about 1330 to 1600. Zen Buddhism likewise won a great following both for its spiritual discipline and essential message and for other aspects of Chinese civilization which it introduced. Sung painting, landscape gardening, flower arrangement, and the tea ceremony, all became truly Japanese. Nichiren Buddhism won many adherents by its very intensity of spirit and also because of its identification of religion with the spirit of loyalty to one's country. One major reason why Buddhism in its various forms now became truly indigenous was that its message was couched in the language of the people instead of the Chinese canonical scriptures and it was made a real part of the common man's life.

In some ways Buddhism during the latter part of this period became too much like the world it was supposed to save. Some of the great temples and monasteries came to resemble feudal states, with many of the monks engaged less in spiritual warfare than in fighting with real swords in defense of their worldly possessions.

With Buddhism becoming thoroughly indigenous, men like Ichijō Kanera (1402-1481) attempted to harmonize it more completely with Shintō, even to the extent of reinterpreting the symbolism of the imperial regalia, giving these a cosmological and ethical connotation. Thus the mirror represented the sun and stood for intelligence and sagacity, the jewel symbolized the moon and the moral qualities of mercy and benevolence, and the flashing sword stood for the stars and signified strength and courage. Ancestor worship was revived and combined with Buddhist philosophical concepts. On the other hand, men like Yoshida Kanetomo (1435-1511) attempted to give the Shintō elements in the religious syncretism greater prominence. In their

Ryobu Shintō, or dual Shintō, they claimed that the Shintō deities were the originals and the Buddhas and Bodhisattvas mere pale Indian reflections of them.

At the end of this period, in 1549, Christianity was introduced with amazing success by Jesuit fathers, led by St. Francis Xavier. Some Japanese saw in it another form of the comprehensive Buddhism. Certain military leaders welcomed the foreigners because of the firearms which the European traders accompanying the missionaries introduced. Oda Nobunaga (1534–1582), the first of the great trio of military leaders who unified Japan, welcomed them for the use he could make of them. His successor, Hideyoshi Toyotomi (1536–1598) was friendly at first but later became convinced that the missionaries were the advance agents of European powers bent on conquest. He therefore adopted a policy of banishing all missionaries and suppressing their converts. Many, under cruel pressure, recanted their faith, but thousands chose martyrdom. By 1638 the last stronghold of the Christians who had risen in revolt was destroyed, and what remained of Christianity was driven underground.

Regimentation of Life and Religion (1600–1868).—With the subjugation of the various feudal states under the Tokugawa shogunate, Japan had peace, but it was more the peace of a police state than that of a free country. In religion the government sought to maintain the status quo. Buddhism was recognized as the dominant religion and was allowed to regulate its own affairs within fixed limits and with the responsibility of keeping a strict religious census to guard against the reappearance of Christianity. The different sects worked out their dogmatic systems and published numerous works. Some monks continued teaching, but the more significant educational work was carried on by the so-called mental culture movement, which was more Confucian than Buddhist. As the guardian of man's ultimate destiny, Buddhism continued to play its accustomed role, but it was less of a factor in this worldly affairs.

The Tokugawa shogunate turned primarily to Confucianism for support in stabilizing the social structure, because central to Confucianism is the ideal of a well-regulated state whose citizens are indoctrinated with the spirit of obedience. Faithfulness to duty, self-discipline, or stern justice constitute the core of morality for all who exercise authority in the state, the community, or the family. It was especially the neo-Confucianism of the Chinese philosopher Chu Hsi (1130–1200) which was favored, though other forms also flourished, sometimes manifesting such a high degree of independence of thought that the government found it necessary to restrict their freedom. Names of such Confucianists as Fujiwara Seikwa (1561–1619), Hayashi Razan (1583–1657), Nakae Tōjū (1608–1648), Hayashi Shunsai (1618–1680), Itō Jinsai (1627–1705), Kaibara Ekken (1630–1714), Arai Hakuseki (1656–1726), and Muro Kyūsō (1658–1734) indicate that the intellectual leadership had passed from the Buddhists who had held it so long. Another marked change was that, whereas Buddhists, especially Zen scholars, had formerly been friendly toward Confucianism, in this period antagonism developed between the two religions. Not only were the neo-Confucianists anti-Buddhist, but many were virtually antireligious or indifferent to religion, their major interest being political philosophy or

humanistic ethical teachings. Nominally they and their families continued some connection with Buddhism, and when a death occurred last rites were performed by Buddhist clerics, but beyond this they had little interest in religion.

One school of Confucian scholars not satisfied with the neo-Confucianism of the Shushi (Chu Hsi) or the O-Yōmei (Wang Yang-ming) schools turned its attention to the older Confucianism. This in turn led to an interest in Japan's own older literature and religion, including ancestor worship and the Shintō doctrine of the descent of the imperial family from the divine ancestress Amaterasu. As good Confucianists, they stressed loyalty to the feudal lord, but some began to see that the Tokugawa shoguns who had so zealously sponsored neo-Confucianism in the interest of their own regime were really usurpers.

A parallel movement begun by the Buddhist monk Keichū (1640–1701) put in vogue the study of national antiquities, which was later brought to fruition by such Shintō scholars as Kamo Mabuchi (1697–1769), Motoori Norinaga (1730–1801), and Hirata Atsutane (1776–1843). From their studies arose a pride in Japan's ancient faith as opposed to the imported Buddhism and Confucianism. This in turn became one of the major factors in restoring the imperial authority in 1868. It also resulted in the appearance of new Shintō sects which gradually severed their connection with Buddhism in the interest of a pure national faith. It was, of course, impossible for them to divest themselves of the age-long Buddhist and Confucian influences, and hence these Shintō sects were really syncretistic in their teachings. Some of them were fairly faithful to the typical Shintō emphasis on loyalty to the heaven-descended ruler, but even these showed the influence of Japan's Buddhist and Confucian heritage. Other sects were virtually Confucian in temper and motivating ideals. And still others stressed not only decidedly Buddhist elements, but also, in their later developments, showed the influence of Christianity, especially in their monotheistic trends. One and all of these Shintō sects had moved far from the sort of religion we find in the early Shintō documents.

What made all of these movements really significant beyond their religious aspects was the part they played in the political developments leading to and following the restoration of the emperor to his rightful place in 1868.

Religion As an Instrument of an Expanding State (1868–1945).—With the restoration of 1868 a new situation was created for religion. Shintoists and Confucian samurai who had taken the lead in the restoration undertook the establishing of a national religion subservient to their interests. The age-long Shintō-Buddhist amalgamation was dissolved. Buddhist priests were ejected from Shintō shrines, Buddhist scriptures and ceremonial objects were burned, and much temple property was confiscated. In short, Buddhism, which for centuries had had a privileged position, was deposed.

These severe measures, however, proved unpopular, and in 1872 an arrangement was made which allowed both Buddhists and Shintoists to manage their own internal affairs with the understanding that they would serve the interests of the state by sponsoring "patriotic and humanitarian principles." The young samurai leaders who had led the restoration movement were little interested in religion as such. Their major con-

cern was a strong state which could hold its own against the aggression of Western powers. To achieve this objective they were ready to learn from these powers and to take whatever measures were necessary to avoid any conflict with them while Japan was weak. That is one reason why in 1873 the edicts against Christianity were removed from the public notice boards and this religion, which had been feared and suppressed for some 250 years, was at last permitted to carry on its work.

In the charter oath taken by Emperor Meiji in 1868, the 5th article stated that "knowledge shall be sought for throughout the world. . . ." Thus when Christian missions established their schools and churches in various cities ambitious young men, including many from the samurai class, were eager to learn from these representatives of the Western World. Christianity became quite popular, probably more for what it brought in its train than for its own essential religious message, though a growing number of Japanese became real converts. In fact, during the 1880's, Christianity was making such an impression on Japan that some officials proposed recognizing it as the national religion. Even some missionaries, believing that their work was no longer seriously needed, returned to their homelands.

It was perhaps natural that this wave of enthusiasm for things Western should be followed in the 1890's by a reaction. Some of the more conservative Buddhists took the lead in anti-Christian movements. They were joined by Shintoists and Confucianists, who were ready to forget their past differences, in forming an organization sometimes called the Great Way Uniting the Three Religions. Some of the leaders were familiar with writings of Western philosophers critical of Christianity, and so they attacked Japanese Christianity as being both anti-Japanese and outmoded in the Western World. This anti-Christian movement, however, was soon overshadowed by the war with China (1894-1895) and the Russo-Japanese War (1904-1905), which tended to unite all Japanese in an ardent nationalism irrespective of religious differences. Japan was well launched on her career as an expanding military state, in which religion often became little more than an instrument of the government instead of preserving its own sovereign rights.

Accompanying this nationalistic spirit was a strong trend toward secularism and indifference to religion. This secularism had its most far-reaching effect through Japan's rapidly developing educational system, which borrowed much from the Western World in the field of the natural sciences and all that makes for industrial progress and military power, but little in things of the spirit. That area of life was supposedly provided for in the Imperial Rescript on Education of 1890. This rescript, largely Confucian in content insofar as it dealt with moral ideals, was proclaimed as representing "the teachings of the Imperial Forefathers," and its aim was the unification of national morality. It soon became a sacred text from which teachers were supposed to derive all that was needed for moral training. Religion as such had no place in public schools and only a very restricted place in private ones. This was not so much separation of church and state as the ignoring of religion and the substitution of the all-sufficient "religion of patriotism" zealously fostered through so-called State Shintō.

State Shintō was called into being during the

1880's after an earlier attempt to make traditional Shintō the state religion had failed. The government by decree divided Shintō into two divisions: State or Shrine Shintō, and Sectarian Shintō. State Shintō, the government leaders explained, was not a religion but a cult of patriotism in which all loyal Japanese could participate irrespective of the religious views they might hold privately. Sectarian Shintō, on the other hand, was to be regarded as a religion and as such equal before the law with Buddhism and Christianity. In the Japanese Constitution of 1889 all recognized religions were given a certain degree of freedom to manage their own affairs and to propagate their faiths. The government exercised control but gave them little encouragement, while at the same time it fostered State Shintō with increasing zeal as Japan advanced steadily toward world power. The restrictions placed upon the recognized religions, though real, were not fatal, and so each of the three religions—Shintō, Buddhism, and Christianity—made fairly substantial headway during most of this period.

Buddhism, which had lost much property, made up for this loss by greater activity in educational, literary, and social service fields. By 1940 the 56 sects and subsects maintained more than 70,000 temples in good repair. Adherents numbered about 45,000,000, though many of these were nominal only. Some sects, particularly Jōdo Shinshu, followed Japanese citizens beyond the borders of the empire and in other ways adapted their work to meet the needs of modern life.

Sectarian Shintō, with its 13 sects, claimed about 17,000,000 adherents. Some of these, especially Tenrikyō, manifested a marked missionary zeal both at home and abroad. In several there was a notable doctrinal restatement by which the myriads of gods of the old Shintō records were replaced by a monotheistic faith. The characteristic Shintō emphasis on loyalty to the ruler was maintained by most of these sects, though there were trends among minor Shintō groups not recognized by the government which seemed subversive and so were suppressed.

Christianity showed a slow but steady advance. Adherents numbered upwards of 300,000, with approximately two thirds Protestants and one third Roman and Orthodox Catholics. Probably 1,000,000 or more could be regarded as affiliated with Christianity. Moreover, Christian influence was considerably greater than the number of professed adherents would indicate.

From time to time the government, concerned about evidences of corruption in society, called together representatives of the three religions, urging them to do more in the way of moral instruction and guidance. After World War I, when Communist influences began to manifest themselves, some officials looked especially to Christianity to combat them. These friendly gestures by officialdom were not taken too seriously, however, since those who made the gestures did not take religion very seriously themselves and at best looked upon it as an instrument of state.

This attitude became increasingly evident through the way in which State Shintō was fostered after the mid-1920's. The wave of internationalism which spread over Japan for a few years after World War I began to ebb, and the nation came more and more under the dominance of military leaders whose religion was an intense nationalism. The cult of State Shintō assumed menacing proportions. The Imperial Rescript on

Education and the imperial pictures became more and more sacred. They were often housed in special sanctuaries in schools, and when brought forth on stated occasions they were handled with reverent care. While the pictures were unveiled and the rescript read, the assembled faculty and student body bowed low. The reader's voice trembled in fear lest he mispronounce some word and so be eternally disgraced. Some school principals actually committed suicide in expiation for such an error.

Compulsory attendance at ceremonies conducted at State Shintō shrines was another way in which this religion of patriotism made its demands. These ceremonies contained elements of traditional Shintō, and so Christians and some Buddhists found it difficult to conform. Some of the State Shintō shrines had for centuries been sanctuaries where the *kami* were worshiped and in the eyes of the public continued to be regarded as religious shrines. Therefore participation in the ceremonies was interpreted as a religious act and not simply an expression of loyalty to the throne. Nevertheless, under pressure and with the repeated official affirmation that participation did not compromise non-Shintoists, most of the Christian and Buddhist schools conformed. In Christian schools it was customary to hold a Christian service at which it was explained carefully that Christians worship God alone and that they attend the State Shintō ceremonies only as an expression of patriotism and loyalty to country and ruler. While this could be done with a clear conscience in Japan proper, in annexed territories, such as Korea, the problem was more difficult for the reason that military officials often stressed the religious meaning, including the old Shintō doctrine of the divinity of the emperor.

In short, the whole trend at the end of this period was to subordinate all areas of life, including the individual's soul, to what the military leaders regarded as the highest interest of an expanding military state, a state which had as its foundations the Shintō myth about the divine descent of the Japanese emperor who, as they boastfully proclaimed, was destined to rule over all of eastern Asia, if not the whole world.

Postwar Religion.—Japan's defeat in 1945 had a decided effect on religion. State Shintō, with its tax-supported shrines and compulsory attendance at stated ceremonies, has been abolished. (Certain historic shrines like Ise continue, however, as ceremonial places for the imperial family and high public officials.) Sectarian Shintō, like other religions, enjoys complete freedom. This freedom, however, has resulted in the proliferation of "new religions," most of which are registered as Voluntary Shintō. Buddhism participates in the new freedom but has been faced with financial difficulties in rebuilding its war losses, and this has led in some cases to strife and divisions. Japanese Christianity has not only shared in the new freedom, but has also enjoyed great support from abroad. Roman Catholicism has shown a new vigor and a corresponding increase in membership. In Protestantism the United Church, embracing about two thirds of all Protestants in Japan, has increased substantially in membership and influence. The new freedom and unprecedented opportunities, coupled with the closing of the doors of Communist China, also have resulted in the influx of many new American sects.

All in all, religion faced a new challenge in post-war Japan.

14. CULTURAL LIFE. In considering Japanese cultural life, primary emphasis will be placed on present day education, with lesser attention being devoted to other aspects of culture, such as exchange of persons, youth organizations, literacy, libraries, institutes, learned societies, and museums.

EDUCATION

Education in Japan before the nation's surrender to the Allied powers in 1945 was highly centralized and thoroughly nationalistic in its organization and aims. Great emphasis was placed on rote learning and very little original thinking was allowed. Textbooks and teachers' manuals were prepared by the Ministry of Education and contained much factual information, but they were not designed to encourage free and unfettered thought on the part of either students or teachers. Entrance to higher schools and assignments to better positions were achieved on the basis of competitive examinations, with often the candidate who could accumulate the greatest amount of facts and write the fastest being given the promotion. The relationship between teacher and student was thoroughly feudalistic, the former showing a paternal concern for the well-being of the latter, and the latter giving unquestioning belief in, and obedience to, the former. As a government official and representative of the emperor, the teacher's word was law.

War Damage.—Great was the damage done by World War II to education in Japan. Four thousand school buildings and 80 per cent of the textbooks and equipment were completely destroyed by bombing. Far greater, however, was the damage done to the minds and spirits of students, teachers, and people in general. The war resulted in thousands of minds being warped by fear, hatred, pride, greed, uncertainty, and hopelessness. The Japanese people felt that they had been tricked and deceived by their leaders. They had lost face before Asia and the world. Students were cold, hungry, tired, and despondent. Teachers were ragged, undernourished, overworked, and dispirited, those who were not killed having been forced to leave their schools because of lack of food, shelter, and adequate salary. To heal the wounded spirits of the people of Japan and to develop a new outlook on life would entail a long period of wise, sympathetic, and thoroughgoing re-education.

Education Under Allied Occupation.—*The Task.*—To reform and regenerate education in Japan was one of the most important tasks of the supreme commander for the Allied powers (SCAP). The Education Division of SCAP was given responsibility for (1) the removal of all ultranationalism and militarism from the

school system, and (2) the complete reorganization of education so as to insure the training of administrators, teachers, and students for a democratic Japan. Directives were issued by the supreme commander to the Japanese government, which passed laws, ordinances, and instructions to implement them.

United States Education Mission.—In March 1946, the United States Education Mission to Japan, composed of distinguished educators, arrived in Tokyo on the invitation of Gen. Douglas MacArthur and for four weeks conferred with Japanese educational leaders and inspected school plants and equipment. The mission then submitted to the supreme commander a comprehensive report which in brief recommended the decentralization of the educational system through prefectural and local administration of primary and secondary schools; the revision of the morals, history, and geography textbooks; a broad health program with increased emphasis on vocational training at all levels of education; the formation of a language commission to effectuate drastic reform in both the written and spoken languages; the extension of compulsory education for nine years or until the student reached the age of 16; the establishment of tax-supported, tuition-free, coeducational schools on the basis of six years' elementary, three years' lower secondary, and three years' higher secondary education, leading to higher education; the modification of teaching methods so as to eliminate memorization and to encourage independent thinking; the re-education of teachers, school administrators, and supervisors; the encouragement of adult education, and the establishment of parent-teacher activities, extension classes, and libraries; the liberalization of the curriculums of junior colleges; the establishment of more and better universities; and complete freedom from government control of all institutions of higher learning.

Japanese Educational Reform Council.—This council, composed of 49 members distinguished in the fields of education, religion, culture, business, politics, and economy, was established on the Cabinet level by imperial ordinance on Aug. 10, 1946. Yoshishige Abe, former minister of education, was made chairman, and Shigeru Nambara, president of Tokyo University (formerly Tokyo Imperial University), was chosen vice chairman. Although it operates autonomously, the council has maintained close liaison with the Japanese Ministry of Education. In general, the council expressed approval of the recommendations of the United States Education Mission. It also made broad and extensive recommendations on the elimination of bureaucracy, equality of opportunity in education, decentralization of educational administration, the establishment of research institutes and postgraduate courses in universities, the improvement of the status of teachers, and the reform of the entire educational system.

Far Eastern Commission.—Another group that contributed no little to the postwar reform of education in Japan was the Far Eastern Commission (FEC). That body, meeting in Washington, D.C., sent in April 1947, as a directive to SCAP, a short but comprehensive statement entitled "Policy for the Revision of the Japanese Educational System." This directive emphasized that education should prepare all Japanese for life in a democratic nation, enabling them to exercise the political and social responsibilities which freedom entails. To accomplish this aim it was necessary

to reform the training, recruitment, and treatment of teachers; to make drastic changes in textbooks, curriculums, and teaching methods; to develop adult and vocational education; to decentralize Japanese education; to provide equal opportunity for both sexes at all levels of education; to forbid discrimination against graduates of private schools in civil service appointments; and to encourage the formation and reorientation of parent-teacher and educational associations to consider practical problems of education. The Ministry of Education and the Japanese Educational Reform Council have undertaken measures for carrying out most of these recommendations.

Kindergartens.—The lowest institutions in the educational ladder are the kindergartens, ministering to children 3, 4, and 5 years of age. Enrollment is entirely voluntary, and a small tuition fee is generally charged. In 1938 there were more than 2,000 kindergartens, of which two thirds were privately operated, with a total enrollment of 270,000 children. During the war almost all kindergartens were closed, but after the surrender many were reopened, and by April 1949, 1,785 were listed, with 8,438 teachers and 228,628 children. At these institutions the following subjects are used or taught: music, stories, painting, construction, nature studies, drama, social studies, health education, rhythms, rest, free play, and excursions.

Elementary and Secondary Schools.—Compulsory and tax-free education begins with the elementary or primary school. Though first established in 1872 as required schooling, elementary education has, since the surrender, been completely reorganized in administration, curriculum, textbooks, teaching methods, and aims. The old educational system was strictly regimented and highly centralized. The bureaucratic spirit was widespread from the official in the Ministry of Education down to the elementary school teacher. The principal ruled his faculty and students with an iron hand, demanding unquestioning obedience, but in turn gave the same obedience to the inspectors and supervisors sent down from the capital. From the beginning of the occupation bureaucrats fought stubbornly against decentralization, which they knew would destroy their power, but in spite of their determined opposition new basic laws of education were promulgated.

Fundamental Law of Education.—This law, which came into force on March 29, 1947, states: "Education shall aim at the full development of personality, striving for the rearing of people, sound in mind and body, who shall love truth and justice, esteem individual value, respect labor and have a deep sense of responsibility, and shall be imbued with the independent spirit, as builders of the peaceful state and society." It also provides for equal opportunity in education, without discrimination on account of race, sex, social status, economic position, or family origin, and for coeducation, home education, and education carried out in places of work. It recognizes the value of politics and religion in life, but directs that schools established by state and local bodies refrain from teaching these subjects.

School Education Law.—This law, effective April 1, 1947, provides for the establishment of sufficient primary or elementary and secondary schools to accommodate school-age children in each city, town, or village. When necessary, however, a group of communities may organize

school unions. It directs that prefectural authorities shall have jurisdiction over public and private schools from kindergartens through high or secondary schools. The minister of education has jurisdiction over public and private universities.

Administration.—Boards of education, elected by the people, were functioning by 1950 in all the prefectures, the larger cities, and to some extent in the towns, and were soon to be extended to all local communities. The administration of elementary and secondary schools was entrusted to these boards, whose autonomy over the nature of the school program was increasing. In April 1949 there were 20,952 elementary schools, with 10,989,069 students and 304,207 teachers. Although a few new school buildings had been erected by 1950, budgetary difficulties and the scarcity of building materials prevented the carrying out of the program for the repair of war-damaged schools and delayed new construction to provide 14,000 additional classrooms. The resulting cramped conditions necessitated two-shift and sometimes three-shift class instruction in many schools. Numerous elementary schools damaged by bombing suffered complete or partial loss of classroom and teaching equipment. Some of this equipment had been replaced by 1950, but in urban centers, where the war damage was greatest, school furnishings were still deficient.

Elementary Teaching and Curriculum.—The school year in elementary schools commences on April 1 and closes the following March 31, but national holidays, Sundays, spring, summer, and winter vacations, and special holidays authorized by prefectural boards of education cut the teaching days to some 235 per school year. In many schools instruction is given six days a week, but an increasing number of prefectures have adopted the five-day week. Class size is limited by law to 50 pupils, but the shortage of classrooms has frequently necessitated crowding 60 or more children into one room. An increasing number of schools are using progressive teaching methods, the main emphasis being placed on social studies. The following subjects are taught in the regular six-year elementary school: national language (reading and writing), social studies, arithmetic, science, music, drawing, handicrafts, practical art, and physical education.

Textbooks.—The elimination of militaristic and ultranationalistic ideas from education and the need for developing a progressive and democratic curriculum in the schools resulted in the revision of nearly all the textbooks of the nation after the surrender. Scores of educators and others interested in writing textbooks daily visit the 13 textbook and curriculum centers scattered over Japan, where they may read hundreds of modern United States textbooks and professional books on education. In spite of the very critical shortage of paper over 200,000,000 textbooks were produced during the school year which began April 1949. In January 1948, the Textbooks Commission of the Education Ministry recommended that beginning with the 1950 school year all textbooks, which had previously been compiled by the government, be replaced gradually by textbooks compiled by private authors, provided such texts met certain approved standards.

Lower Secondary Schools.—The lower secondary school, or junior high school, includes grades 7 to 9. In enforcing the nine-year minimum of compulsory education, the government allotted the buildings of the former youth schools and

higher elementary schools to the new secondary schools, but there still remained a considerable shortage of buildings. Budgetary difficulties prevented the construction of needed classrooms. This necessitated, as in the case of many elementary schools, two-shift and sometimes three-shift class instruction. In April 1949 there were 12,415 public and private lower secondary schools, with 195,383 teachers and 5,177,455 students. Each city, town, and village is normally required to provide, free of charge, educational opportunities for the entire school population in grades 7 to 9. It was expected that when the system reached full operation, cities would have several lower secondary schools, each large town or village would have at least one, and smaller villages might join other small communities in supporting a consolidated school. In 1950 many of the schools already established were still sadly deficient in classroom facilities and equipment.

The curriculum of the lower secondary schools lays particular emphasis on the development of the pupil's personality and individuality and on the ability to participate effectively in community life. It also provides vocational guidance and some vocational training.

Private Secondary Schools.—Upon completion of the six years of elementary work the pupil is automatically promoted to the lower secondary school, thus eliminating entrance examinations in public schools. The number of applicants for private secondary schools, both lower and higher, far exceeds the available openings, and students are selected on the basis of reports from elementary schools, physical examination, and personal interviews. Thus these private schools have been able to maintain their school traditions and have held to a higher standard of education than most public lower secondary schools. Private schools also do not have to adopt coeducation. Many conservative parents prefer to send their children, especially their daughters, to a private secondary school which is not coeducational. Private secondary schools are generally not so crowded as the public schools, which permits more individual attention to be given to the student.

Upper Secondary Schools.—Upper secondary schools, or senior high schools, are the connecting link between the lower secondary schools and the universities. In April 1949 there were 2,935 such schools, with 95,489 teachers and 1,624,384 students. There are two types of upper secondary schools: those offering full-time courses either during the day or at night or both; and part-time schools for working students and those in farming and fishing areas, who can pursue their subjects only during certain seasons of the year. Most secondary schools also give specialized courses in agricultural, technical, industrial, commercial, and other vocational fields. Because of the limited capacities of upper secondary schools students were in 1950 selected on the basis of competitive examinations covering the Japanese language, the social sciences, and mathematics, but considerable attention also was paid to reports from the lower secondary schools on achievement tests, physical examination, and personality. Like the lower secondary schools, the upper secondary schools are under the control and administration of the prefectures. Coeducation is encouraged but is not mandatory, and a relatively small tuition fee is charged. In 1950 it was expected that these schools would eventually be

free, and that there would be enough of them to take care of all graduates of the lower secondary schools who desired to continue their education.

There are a number of elective courses in the curriculum of the upper secondary school. In addition to the required subjects of Japanese language, social studies, mathematics, natural science, and physical education, the student may select from a comparatively wide range of electives the special subjects which interest him and may be of use in his chosen profession. Upon graduation the student may sit for the entrance examination of any university. Eventually upper secondary schools were to be well-equipped, well-housed, and adequately staffed institutions, but in 1950 they were still greatly handicapped by economic obstacles and shortages.

Vocational Training.—In view of the urgent need for trained personnel to aid Japan in her economic recovery, many courses are given in upper secondary schools, colleges, and universities which "are designed to provide students with the technical knowledge and skill necessary to qualify them for successful employment in specialized occupations on the vocational level." Vocational education is also provided for public service occupations such as the fire and police systems and the civil service. Modern programs of education and rehabilitation are provided in prisons and reformatories. Vocational and special educational activities are carried on for blind, deaf, crippled, or otherwise handicapped persons.

Teacher Training.—*Reorientation.*—In the reorganization and reformation of Japanese education great stress was laid upon the proper training and reorientation of teachers. An early SCAP directive called for the elimination from the educational system of all persons known to be ultranationalistic, militaristic, or antagonistic to the objectives and policies of the Allied occupation. Steps were also taken for the reinstatement of properly qualified teachers and educational officials who had been purged by the Japanese militarists since July 7, 1937. Committees were set up to investigate and screen all educational personnel, and to certify all who were found to be properly qualified. Of the approximately 600,000 teachers in Japanese elementary and secondary schools, about 120,000 resigned or were purged between August 1945 and April 1947. The teachers who survived the purge and those who were newly appointed were sent to teacher training institutes, vacation schools, and refresher courses for reorientation. For the re-education of teachers, the Ministry of Education prepared courses of study to cover the various subjects taught in the schools. Teachers were learning to think for themselves. A new generation of Japanese was being trained to act and speak as independent individuals. Emphasis was placed on personality and character development as well as on intellectual training, not on regimentation and subordination to the state, as was the case before the surrender.

Organizations and Training.—Teachers' associations of all kinds including teachers' unions have been organized. The aim of the latter is to improve the economic condition of teachers, for as a profession they are grossly underpaid. Each year teachers hold many conferences for the exchange of information and the consideration of practical problems of education. Normal school courses have been modernized, and universities are offering courses in education, psychology,

teaching methods, school administration, educational research, and other subjects. Books, pamphlets, and magazines for the teaching profession have appeared in increasing numbers.

Adult Education.—For the prewar adult education, which was completely under government control, there have been substituted various educational programs for training in citizenship and in the development of leadership. Parent-teacher associations have rapidly grown in influence and number and have increasingly accepted new and larger responsibilities. Citizens' public halls have been established in local communities. The halls are managed by local boards and provide opportunities for the townspeople to practice democratic procedures. In many communities books, radios, motion picture projectors, and athletic equipment have been purchased for use in the halls, thus making them the cultural and social centers of the district, town, or village. Correspondence and extension courses have been established, with a full-time teacher for each 100 correspondents. Leading private universities, such as Keio, Waseda, and Hosei, offer correspondence courses for in-service training of elementary and secondary school teachers. To preserve the old arts and to promote new cultural forms, various essay, drama, music, and art contests are sponsored throughout the country.

Audio-Visual Education.—In the program for reorientating Japanese education, audio-visual media have been used very effectively. In nearly all institutions of learning, motion pictures, film strips, and phonograph records have provided supplementary teaching material which has been integrated into the courses of study. The Educational Film Exchange, operated by SCAP, has provided a large number of Allied educational and documentary films, to which sound tracks in Japanese have been added. Radio broadcasts to and from schools have proved to be very effective media for democratic education.

Higher Education.—Before the surrender, Japanese institutions of higher education, like the primary and secondary schools, were under government domination. The prestige of the six imperial universities was so great that 40 per cent of the graduates went into government service. Graduates of private universities were greatly handicapped in securing positions either in government service or in private business organizations. Only a few women were admitted to the universities. Competition among men applicants was so keen that selection was made through an examination system which stressed rote memory to the exclusion of many other important qualifications of a good student.

After 1946 many important changes were made in higher education. The three-year universities were changed to four-year institutions, and by improving the curriculums and standards of other colleges many new four-year universities were added. The University Accreditation Association, an autonomous body independent of governmental control, was established to evaluate university work in terms of credit and to make certain that minimum standards of curriculums, instruction, and equipment were met. Accredited universities enjoy privileges of transfer of students from one institution to another without loss of credit. The University Chartering Committee was established on Jan. 15, 1948, under the supervision of the minister of education, to "make inquiries and deliberate on matters concerning

approval of the establishment of universities as well as the doctorate and other academic degrees. . . . Plans were also made to establish graduate schools in certain qualified universities. The new universities, which presumably would have full administrative autonomy, were placing special emphasis on general education as a preparation for later professional training.

The physical plants of many colleges and universities in the large cities were severely damaged by bombing. Because of the lack of building materials and economic resources, only relatively few of the damaged buildings had been repaired or rebuilt by 1950. Nonetheless, on April 1, 1950, there were 197 fully accredited four-year universities, of which 68 were national, 25 public, and 104 private. In addition, there were 150 two-year junior colleges. Over 500,000 students were enrolled in these institutions of higher learning. Many of the universities were coeducational, women being admitted on the same basis as men. Students are selected on the basis of achievement tests, scholastic aptitude tests, physical examinations, and reports from schools. Graduates of private universities may now enter government service on the same competitive basis as the graduates of national and public universities.

EXCHANGE OF PERSONS

Before World War II, a great many Japanese students and scholars went abroad for further study, training, and scientific investigation. For nearly 10 years Japan was cut off from cultural contacts with the West, contacts which had proved mutually beneficial. Recognizing the importance to Japanese cultural leaders, teachers, and students of visits to the United States for purposes of reorientation, special funds were appropriated by the United States Congress in 1949 for this purpose. Japanese leaders who have made such visits are contributing to the growth of Japan as a democratic nation. In addition, many United States specialists in all fields of culture and science were brought by SCAP to Japan to advise and assist leaders there. Since 1947 a number of private social, cultural, and educational organizations in the United States have supported financially Japanese students and cultural leaders in their visits abroad. In addition, in 1951 an educational exchange program was inaugurated under the provisions of the Fulbright Act.

YOUTH ORGANIZATIONS

The economic and social disruption of the war and postwar periods resulted in extreme confusion among Japanese youth. Militaristic and ultranationalistic youth leaders were purged, and it was difficult to find qualified, democratically inclined leaders to take their places. By 1950, however, youth organizations were beginning to participate in programs for rebuilding Japan into a democratic nation. Among the most important of these organizations are the Nippon Seinen Kan (Japan Young Men's Hostels), Nippon no Seinen Kai (Japanese Youth Associations), the Boy Scouts, the Girl Scouts, the Junior Red Cross Society, and the Young Men's and Young Women's Christian Associations. The two last-named organizations are actively engaged in leadership programs along spiritual, moral, and social lines, with special emphasis upon the importance of international relations.

LITERACY

The question of literacy in Japan is intimately connected with the problem of language reform. If by literate we mean the ability to read kana (Japanese phonetic symbols), it would be safe to say that nearly all Japanese from the age of 6 upward are literate; but if the criterion of literacy is the ability to read and understand completely the newspapers, which are printed in an admixture of Chinese ideographs and Japanese phonetic symbols, it is doubtful whether 60 per cent of the population can be considered literate. The United States Education Mission to Japan recognized that the intricacy of the Japanese language is a great obstacle to the democratic development of the people. Consequently, it recommended that steps be taken to simplify and romanize the written language. While that recommendation has not been fully adopted, Japanese leaders recognize the need for language simplification, and are endeavoring to solve the problem by teaching Romaji (Jap. *rōmaji*, or Roman letters) in elementary schools, by reducing the number of Chinese ideographs to be taught in elementary schools, by encouraging newspapers and periodicals to stay within that prescribed number, and by promoting the use of simple language in both writing and speaking.

LIBRARIES

The Ministry of Education, reporting on the condition of libraries in Japan on May 1, 1946, listed 3,398 libraries, of which only 874 contained 3,000 or more volumes. Most of the largest Japanese libraries are in urban areas where they suffered heavy loss from bombing, and consequently were still in a state of confusion in 1950. For example, the Tokyo Metropolitan Library with its 27 branches lost, during the incendiary bombing, one third of its collection of 700,000 volumes, while the Nagoya Municipal Library lost 93,000 volumes out of a total of 160,000. Statistics indicate that 138 libraries were heavily damaged or entirely demolished. It was recognized that there was great need for revising and reforming the whole library system. This was being accomplished by giving libraries greater financial support from government and private sources, by improving the training and raising the professional standing of librarians, by making libraries more accessible and attractive to the public, by establishing in each prefecture and large city at least one good free public library, and by improving school and university libraries. The Japanese government has made appropriations for expanding and improving the Diet Library, and two prominent United States librarians have assisted in studying and solving the problems connected with this institution.

Information Centers.—In the forefront of the battle for more and better libraries were the 17 information centers conducted by the Civil Information Section of SCAP, which were located in the major cities and four main islands of Japan. These served as small but well-staffed and carefully equipped models for Japanese libraries. Each center contained at least 6,000 books, 400 periodicals, and several thousand pamphlets and documents, all in English (which many Japanese can read), and covering all fields of knowledge. They were easily accessible to the public and free of charge. Not only the general public, but hundreds of Japanese government officials, political and labor leaders, industrialists,

physicians, research workers, teachers, and students availed themselves of the excellent facilities of the information centers, where they received the latest and most authoritative information in international affairs, research, technology, World War II, and "the policies and activities of the United States as they develop from American customs, institutions and government." At each center films were shown, United States music was played, English language classes and discussion groups were held, and numerous other activities took place. Many of these centers extended their usefulness by depositing United States books, magazines, films, and records in adjacent Japanese schools and public libraries.

INSTITUTES AND LEARNED SOCIETIES

Some professional and learned societies have training and research institutes, but the Institute for Educational Leadership, which was sponsored jointly by the Japanese Ministry of Education and the Education Division, Civil Information and Education Section of SCAP, has been outstanding in meeting a real need in the field of Japanese education. The institute, with 21 United States and 26 Japanese specialists on its staff, conducted courses in 1948 and 1949 for the training of elementary school consultants, secondary school consultants, superintendents and professors of education, youth leaders, university administrators, and student guidance personnel. A total of 3,700 persons completed the training and returned to their communities to assume active leadership in guiding and educating youth in all parts of Japan. In March 1948 there were 253 Japanese learned and professional societies in 60 different fields of science and culture.

MUSEUMS

As depositories of culture, both ancient and modern, museums have an important place in Japanese education. Many of the fine collections, especially those in urban areas, were badly damaged by bombing, and those that remained were greatly disorganized. The Religions and Cultural Resources Division, Civil Information Section of SCAP, greatly assisted the Japanese government with advice and recommendations regarding the financing and management of many projects for the preservation, protection, restitution, and restoration of antiquities, archives, cultural treasures, art collections, and museums. In spite of the financial limitations of individuals as well as public organizations, by 1950 much had been done along these lines.

15. SCIENTIFIC RESEARCH. Although science as understood in the Occident developed in Japan after the Meiji Restoration of 1868, the Portuguese had introduced certain aspects of Western science, such as medicine, navigation, cartography, and gunnery, in the 16th century. This section emphasizes the relation of scientific research to the development of modern Japan, with minimum attention being given to individual achievements in specific fields.

Pre-Meiji Science.—For the greater part of the three centuries prior to the Meiji Restoration the Tokugawa shoguns had forbidden all Japanese to leave the country and had prohibited the entry of foreigners, excepting only the annual Dutch factory at Nagasaki. Hence ambitious youths thirsting for the arts and sciences of the West surreptitiously made their way to Nagasaki. By 1774 this group of so-called Dutch scholars was able to translate and publish a Dutch work on anatomy, the first European work to be printed in Japan. And by the end of the 18th century translations of standard European works on astronomy, mathematics, medicine, and botany had been published. In appraising their work, the difficulties met by these scholars must not be forgotten. Foreign books, virtually banned by the government in its enforcement of the seclusion policy, had to be obtained, and the more formidable problem of learning the Dutch language and of coining appropriate Japanese terminology had to be overcome. In 1823, Philip Franz von Siebold, a German physician in Dutch employ, arrived in Nagasaki and initiated lectures on clinical medicine; later he opened a school where young Japanese who braved the difficulties of learning the Dutch language might study medicine and botany. Tacitly conceding the value of medical knowledge, the shoguns winked at these illegal activities. Thus, knowledge of Western medicine continued to grow. In time the Japanese turned from the translation of Dutch works to British and United States treatises. On the eve of the restoration the Japanese were not only studying the medical science of Great Britain and the United States, but were also using the personal services of doctors from these countries.

Meanwhile, the Japanese were investigating the intricacies of other sciences. Gennai Hiraga, for example, had acquired some knowledge of electricity while visiting Nagasaki. He returned to Edo (now Tokyo), built an electrostatic machine, and demonstrated it publicly. The shogun, however, deemed Western learning politically dangerous, and Hiraga was punished severely for "misleading the public with Western magic."

It should be noted that during this period certain advances independent of Western influence had been made in some aspects of science. In mathematics the numerical solution of equations of higher degree had been mastered by the Japanese without the assistance of the West, and Kowa Seki had conceived and utilized the idea of determinants in his calculations. In surveying and cartography, Ino Chupei had accomplished the feat of surveying and mapping the shoreline of Hokkaido a few years before von Siebold's arrival in Japan. Astronomy also had long been a subject of interest to the Japanese because of its importance to navigation and calendar making. Careful records of astronomical phenomena had been kept and preserved for centuries. In descriptive biology some notable catalogues had been compiled. But even with these sciences it re-

maintained for Western science, with its methodology and experience, to provide the stimulus and guidance for their further development.

From the Meiji Restoration to World War I.—The Meiji Restoration repudiated the isolation policy of the Tokugawas and actively fostered the introduction of Occidental knowledge. Science, however, requires a foundation of mass education; although the Meiji government established a compulsory educational system, some 20 years elapsed before Tokyo Imperial University (founded in 1877) could assume the form of a truly modern institution. Its early faculty included such distinguished Westerners as Sir James A. Ewing of Great Britain (physics), R. W. Atkinson and S. Divers of Great Britain (chemistry), and Edward S. Morse of the United States (zoology). Until 1900 most of the medical chairs were occupied by Germans, to whom the Japanese had turned upon learning that German medicine was then far in advance of that of other countries. Among them, E. O. E. von Baelz was outstanding. Japanese scholars, trained abroad at government expense, returned home to lead in education and research. Notable among these scientists were Dairoku Kikuchi, in mathematics; Kenjiro Yamakawa, in physics; Naokichi Matsui and Joji Sakurai, in chemistry; Kiyokage Sekiya, in seismology; and Ryokichi Yatabe and Masakazu Toyama, in botany. As additional imperial universities were established and private institutions took shape, science developed apace.

By 1900, European scientific journals were carrying reports of research by Japanese scientists. Perhaps the first Japanese achievement to draw international attention was the discovery of the so-called Z-term by Sakae Kimura, professor at Tokyo Imperial University. At an international scientific conference on the variations in position of the earth's axis, Mizusawa in northern Japan was selected as one of many scattered observation points. Professor Kimura offered to conduct the observations. At a subsequent conference, the results of observations in various countries, except for Kimura's data, conformed consistently to a simple mathematical formula. The discrepancy was explained away on the basis of inferior technique, but Kimura remained unconvinced and stood by his data despite the censure of his Japanese colleagues. He then returned to his observatory and analyzed his data mathematically. He discovered that by correcting the formula by the addition of what he called the Z-term his conclusions could be aptly expressed. European scientists tested his revision of their formula and vindicated his observations. The Japanese public heralded this incident as proof that Japan's science now equaled that of the West—a conclusion congenial to the intense nationalism that followed the Russo-Japanese War. The Imperial Academy of Japan established the Academy Prize, and Kimura was the first Japanese scientist to be thus honored.

Japanese scientists themselves disliked such publicity, for they were quite aware of the fact that the level of science in Japan averaged below Occidental standards. Gradually, however, research in other fields began to draw attention from scientists in Europe and the United States. Hantaro Nagaoka of Tokyo Imperial University developed a theory of atomic structure; at the same institution, in 1910, Umetaro Suzuki discovered vitamins, and Kikunae Ikeda discovered *aji-no-moto* (essence of taste), a discovery in

which United States scientists showed interest after World War II.

Professor Nagaoka's model of the atom—as electrons revolving about a positively charged heavy particle—anticipated the discovery of the atomic nucleus by the 1st Baron Rutherford of Nelson; Niels Bohr used a similar model in his quantum theory. In older discussions, this model was termed the Nagaoka-Rutherford-Bohr model.

Professor Suzuki's independent discovery of vitamins generally had not been accorded priority over the discoveries of Occidental scientists. At that time the authenticity of Japanese scientific journals was not accepted, and Suzuki lost the opportunity to assert prior discovery. To correct this situation the Imperial Academy decided to publish monthly periodicals in English and other foreign languages. In due season these journals achieved international acceptance.

Professor Ikeda's discovery of *aji-no-moto* has been important in applied science. The product has enjoyed worldwide sale as a means of intensifying the flavor of foods to which it is added.

Meanwhile, the science of seismology was making phenomenal progress. Within a few years after its introduction in the 1870's, the Japanese, through Kiyokage Sekiya and Fusakichi Omori, gained international renown. Among the achievements of this group of scientists was the perfection by Aikitsu Tanakadate of the parallel-motion seismograph and of the spiral seismograph for recording vertical motion.

In geology and mineralogy the Japanese had taken over the teaching of these sciences at Tokyo Imperial University from their Western tutors by the late 1880's. And by 1896 Japanese botanists had made a notable contribution to the science of plant morphology by their discovery of spermatozoids in the pollen tubes of the ginkgo and cycad.

In technology, the Japanese had been almost wholly dependent on the West. In the early decades of the Meiji era (1868-1912) importations of Western technology had gone on at a feverish pace. One notable Japanese contribution, however, was the invention of the automatic power loom by Sakichi Toyoda (1895). This machine revolutionized the Japanese textile industry.

Developments from 1914 to 1941.—World War I and the immediate postwar period constituted a very important era for modern Japan. National economic potential and living standards increased rapidly; scientific research expanded, and projects multiplied, with notable increases in the number of universities and laboratories. Outstanding, perhaps, was the work of Kotaro Honda, professor at Tohoku Imperial University and president of its metallurgical institute, who pioneered in the investigation of the magnetic properties of ferromagnetic metals and alloys. His K.S. magnet exhibited the highest permanent magnetism then known and was used widely in industry.

From its inception, however, Japanese research showed an almost fatal weakness: the lack of close coordination between science and industry. In Great Britain, for example, rapid development of science had accompanied the Industrial Revolution: the industrial development of the steam engine was inseparable from the theory of heat and thermal properties of matter. As an integral part of human civilization, science must

find its *raison d'être* in its utility for better living. Japan imported science from the Occident without maintaining its connection with the industry that also was being imported from the West. While government-aided scientists were striving vigorously for world recognition, Japanese industrialists were importing both machines and engineers from Europe and the United States, oblivious of the inevitable liaison between science and industry. Neither group should be blamed; the borrowing of an alien culture is a herculean task, and Japan had no precedent to guide her. The industrialists had to achieve a return on invested capital and the surest and shortest way was direct reliance on ready-made, well-tested products from the West.

Understandably, if unwisely, the scientists reacted by taking refuge in an ivory tower of academic isolationism and by looking down upon industrialists as mere money grubbers. This deeply rooted attitude of Japanese scientists has blocked progress. Professor Honda's work with magnetism was one of the happy exceptions: the institute over which he presided was a gift from the industrialist Kichizaemon Sumitomo. Many of the findings of research at this institute were developed commercially on a large scale by the Sumitomo Manufacturing Company. Honda's use of the initials K.S. to denote his new magnet was a tribute to his industrial backer. Nevertheless, it remained for European and American industrialists to apply this discovery extensively.

The Japanese government took cognizance of the separation of science and industry and, as a possible bridge over the gap, established the Institute of Physical and Chemical Research (IPCR) in Tokyo in 1916. Leading industrialists contributed large sums, laboratories were built and equipped, and noted scientists were invited to join the staff. Among them were Han-taro Nagaoka, Kotaro Honda, and Umetaro Suzuki. The plan was to support the institute from patent royalties, and the government granted a 10-year subsidy to tide it over until such support materialized.

The IPCR soon produced important inventions and became a major shareholder in numerous companies that were established to manufacture the new inventions. Among these products were synthetic sake (rice wine), different kinds of vitamins, scientific precision instruments, and piston rings. Profits from the synthetic sake and vitamins enabled the institute to attain self-support. With the general economic expansion of the 1930's and the early 1940's, the concerns affiliated with IPCR expanded rapidly and became important industrial forces.

A special feature of the IPCR was its conduct of extensive research in pure science without detracting from its industrial program. This the institute continued to do until it had to change its organization in 1945. It had maintained one of the most active research centers in Japan; its laboratories were better equipped and maintained than those of the universities, and they were staffed by capable young workers. In 1937 a very large cyclotron was begun under the direction of the distinguished physicist Yoshio Nishina; this enterprise resulted in important contributions to nuclear physics. Under IPCR auspices, Umetaro Suzuki pursued his investigations of the chemistry of vitamins in relation to nutrition. Shoje Nishikawa's study of crystal structures by X-rays and cathode rays were highly

fruitful; under his direction Seishi Kikuchi investigated the diffraction of cathode rays by crystals, which attracted attention in 1927.

The IPCR undoubtedly pioneered in the integration of Japanese science and industry. It has been criticized on the ground that it competed with other industries instead of preserving a neutral position and extending to all industries the benefits of its discoveries. Masatoshi Okochi, president of the institute from about 1930 to 1945, seemed to feel differently. If he admitted the truth of this criticism in principle, on the basis of experience he doubted whether capitalists motivated by a desire for profits would return in contributions any fair proportion of the profits they obtained from IPCR achievements. Okochi encouraged every kind of research undertaken by institute scientists; and, research being expensive, this policy entailed considerable reduction in the profits of the companies under IPCR control.

Objectively considered, it is reasonable to doubt whether a problem so large as the effective coordination of science and industry could have been solved so quickly by a single organization. As it happened, the economic improvement of the 1930's generally increased incomes in Japan, and wealthy industrialists donated large sums to universities to aid scientific research. At the same time, the Japanese Army and Navy began to support research directly and indirectly. Unhappy encounters with Soviet mechanized troops along the Manchurian border in 1938 (see section on *Foreign Relations [1931-1945]*) had convinced the army command of the need for the promotion of scientific research in collaboration with industry. The result was an appropriation by the Diet of an annual budget for research.

Simultaneously, the Japan Association for the Promotion of Science and Industry was instituted and granted government subsidies. This organization selected for investigation the most urgent problems from various scientific and industrial fields and assigned each problem to a special committee of engineers and scientists. Some of the projects, such as nuclear physics, were in pure science; others, such as synthetic oil, synthetic rubber, and improved carbon brushes for motors, were industrial. The committees encountered problems of practical psychology; engineers affiliated with competing industrial organizations were loath to pool their special techniques and secret discoveries. Furthermore, the army and navy, for reasons of security, kept their findings secret. Nevertheless, Japanese scientists were working more directly with practical problems than they had before.

All these circumstances stimulated and expanded the scope of research in Japan in the 1930's. It was then that Hideki Yukawa evolved the meson theory for which he was awarded a Nobel Prize in 1949. Two cyclotrons were operating by 1938, one at the IPCR and the other at Osaka Imperial University. While we have stressed the field of physics, analogous situations existed in other branches of science.

Science in World War II.—In 1941, when Japan became an active belligerent in World War II, Japanese science and industry lost contact with their Occidental counterparts. The test was severe; after 80 years of struggle, would they be strong enough to proceed alone?

In the field of pure science, the theoretical physicists, headed by Hideki Yukawa, continued research on the meson. Shinichiro Tomonaga

contributed to a new formulation of quantum electrodynamics; Shoichi Sakata contributed to the two meson theory and the neutral meson theory, and these played an important part in postwar theoretical physics. In general, however, the results were disheartening. Progress ceased completely in experimental nuclear physics, although at the beginning of the war nuclear physicists had urged research into atomic energy. The army and navy, acting separately, surveyed the sources of uranium-bearing minerals and soon discovered that almost no sources of uranium were within reach. Previously all uranium products had been imported; hence there were no factories for refining such minerals and the technology was almost unknown. A group of nuclear physicists tried in 1942 to obtain uranium, but got only a few pounds of uranium oxide and uranium nitrate that had been imported from Germany before the war. It was thus impossible to conduct even the fundamental studies that might have ascertained the probability of a chain reaction of nuclear fission. Hence most of the nuclear physicists turned to other projects. Even in applied science fields that were vital to the conduct of the war, activity was limited severely by the lack of an administrative policy for research and by shortages of every kind of raw material. In fact, the overcoming of these shortages was an immediate and primary concern of Japanese science after 1941. In this connection, some results were obtained in the production of methane gas from sewage and garbage, of lubrication oil from animal matter, of wool from whale collagen and fish refuse, and of synthetic fibers from an ever-increasing number of fibrous materials. Attempts were also made to supplement the power shortage by utilizing subterranean heat and water from hot springs. These developments, however, with the exception of synthetic fiber, were on an extremely small scale. Thus, except for theoretical physics, almost no progress was made during the war. There were too many handicaps; the test was too severe.

Postwar Scientific Research.—With the collapse of Japan in August 1945, the background for scientific research seemed entirely lost. The industrialists were helpless; their factories had been destroyed, and there was no capital and no means of buying machinery from abroad. The scientists were similarly helpless. Laboratories and facilities had been destroyed or neglected. The Tokyo Astronomical Observatory, which had been able to maintain contact with the Copenhagen Astronomical Observatory for a year after the start of hostilities, was damaged and a section of its library was destroyed by fire. Seismology, a science not directly useful to the prosecution of the war, lost valuable ground. In December 1943, when a severe earthquake shook the area between Aichi and Wakayama prefectures, the routine seismological check-ups could not be conducted because of the deterioration of instruments and the lack of competent personnel. Geology also suffered, though not for the same reasons: since 1937 there had been a gradual exodus of trained geologists to the conquered areas of eastern and southeastern Asia to make surveys and studies of mineral resources. The suspension of the compilation of pre-Meiji scientific source materials, a project begun during the war under the auspices of the Imperial Academy, was a severe blow to students of the history of Japanese science.

Early in the postwar period, however, the urgency of effecting industrial recovery began to stimulate a revival of the work of Japanese scientists. The IPCR, which had partially lost its identity, began afresh as the Science Institute headed by Yoshio Nishina. Under the joint supervision of former nuclear physicists and its own staff chemists, the institute initiated, and took the lead in, the production of penicillin. Every field of science and industry saw similar developments; the ivory tower had been destroyed. The problem of cooperation between science and industry seemed to be finding its own solution.

After the war there was considerable reflection and discussion on the role of science in Japan's future. Scientists and technicians clamored for a reorganization of the structure of Japanese science. The result was the creation of the Japan Council of Science in 1948 by an act of the national Diet. Its establishment was preceded by a survey of the state of Japanese science by an advisory group of eminent scientists from the United States, and by a series of studies and deliberations by a committee of 108 Japanese scientists. Through the council the government aimed to democratize science by making its membership of 210 scientists and technicians (30 in each of seven departments, of which four are in the sciences and three in the humanities and social sciences) elective for three-year terms, and by empowering it to advise the government on all matters pertaining to science and to make recommendations for the disbursement of government subsidies for research. In the first election, which was held in December 1948, 35,354 qualified scientists and technicians cast their votes to select 210 council members from among 945 candidates. With the creation of the council, the Imperial Academy was dissolved and replaced by the Japan Academy to serve under the direction of the council. The new academy's function is to accord due recognition through annual prizes to outstanding Japanese scientists by appraising their findings, treatises, and works.

The subject of science education in the schools also received much attention after the war. In the reorganization of the Ministry of Education in 1946 a new Bureau of Scientific Education was created. It was charged with some of the functions of the former Bureau of Vocational Education, but was concerned essentially with scientific education.

The award of a Nobel Prize in 1949 to Hideki Yukawa for his theory of mesons was an outstanding event in postwar Japan. It should be remembered, however, that his research was accomplished before the war under conditions more favorable to science. While postwar conditions were far from ideal for the promotion and development of science, there were nevertheless isolated but significant signs of recovery by 1950. For example, at the 8th International Genetics Conference in Stockholm in 1948, Hitoshi Kihara of Kyoto University, the first Japanese scientist to attend a postwar international scientific meeting, read his paper on the synthetization of bread wheat, a method he had developed after his discovery of one of the basic components of bread wheat in 1944. Also in 1948, the results of experiments and research on as many as 770 subjects were announced at the general meeting of the Japan Chemical Association. On the subject of vitamins, in which the Japanese had made

notable contributions in the past, Kazuo Nakahara of Tokyo University (formerly Tokyo Imperial University) isolated an important factor from the vitamin B group which he named vitamin L. This factor, which controls the mammary secretions of rats and mice, consists of L₁ (anthranilic acid) and L₂ (adenylthiomethylpentose). In the sericultural and agricultural laboratories experiments were being made to improve the cocoon and grain seeds, while the industrial laboratories were concerned with the improvement of textile machines, mining instruments, and other equipment.

In medicine the paramount trend after the war was toward preventive medicine, as was to be expected by the nature of its most urgent problems: malnutrition, public health, and sanitation. In the early months of 1946 epidemics of typhus and smallpox were brought under control with the cooperation of the Allied occupation authorities. There was also a noticeable reduction in the high death rate from tuberculosis, mainly through the intracutaneous administration of BCG (*Bacillus of Calmette and Guérin*) vaccine. Among other studies being made in the clinical laboratories of Japan were ones on the effects of exposure to radioactive rays, on the relation of viruses to cancerous growth, and on the removal of pain through simple operations on minute nerves.

An event which foretold closer cooperation of Japanese and Western scientists was the observation of the annular solar eclipse of May 8-9, 1948, conducted under the joint auspices of the supreme commander for the Allied powers, the American Geographical Society, and the Tokyo Astronomical Society. Another indication of closer international cooperation was the growing number of Japanese scientists going abroad, especially to the United States, for research. It was hoped thereby that scientific research would recover its former position and that Japanese scientists would have opportunities to serve mankind.

16. THE FINE ARTS. Much of the history of Japanese art is concerned with the importation of foreign art forms and their subsequent development into forms which bear the unmistakable stamp of Japanese characteristics. It is therefore of interest to study the art forms existing in Japan before the first great wave of foreign influence, which came with the introduction of Buddhism in the 6th century A.D.

Most of the objects still extant naturally fall under the heading of applied arts—that is, they are objects made primarily for practical use. They include weapons, pottery, mirrors, horse

trappings, and the like. Those which can be traced with considerable sureness to the ancestors of the present Japanese people (as distinguished from the Ainu aborigines) show in their form and decoration considerable likeness to contemporary foreign objects, mostly Korean and Chinese.

Fortunately, however, for our present purpose (which is concerned only with the fine arts of painting and sculpture) the earliest Japanese sculpture shows little if any trace of outside influence. These sculptures are grave figures (*haniwa*) made of hollow baked clay; they represent not only human beings, but also a variety of animals. They were made to be buried around the tombs of chieftains and other high personages, and therefore the lower halves of many of them were simple cylinders. Nevertheless, they show simplicity and directness in both apprehension and representation. This may be regarded as fundamental. The animal figures, especially, show a sympathy with nature which also seems a general characteristic of Japanese art. No painting of this period has survived. If we may judge by the few pictorial designs found on bronze mirrors and bells (*dōtaku*), it was probably quite primitive.

Suikō (Asuka) Period (c.570-650).¹—Japanese records indicate that the indigenous production of Buddhist images had begun during the 6th century, but these seem to have been for the most part made of wood and none of the very early ones has survived. The oldest extant definitely dated statue which gives a clear idea of the style is a bronze figure of a seated Yakushi (Buddha of Healing) of the year 607. Both this and other figures which date from the first quarter of the 7th century are so like the Wei type of Chinese sculpture that it has been suggested that they were made by Chinese artists. Yet we have documentary proof to the contrary. Shiba Tori, the most famous sculptor of the period, was the son of Shiba Tasuna, an artist recorded as working in 585, and a grandson of Shiba Tattō, who was the original immigrant of the family. Then there is the question of dates. One of Tori's "Wei" statues is dated 623, at which time the Wei style had long been outmoded in China. The probability is very strong that early Japanese artists simply copied the images brought over when Buddhism was introduced. These were indubitably of the then contemporary Wei type.

It should be noted that, although the Wei type is primarily adapted to a stone technique, all the Japanese early work seems to have been either wood or bronze. There is no work in stone, apparently because Japan is of volcanic origin and there was no marble or other fine-grained stone available. Nevertheless much of it is artistically highly admirable, and at least one piece, the so-called Yumedono Kwannon at Hōryūji, near Nara, is rated among the great statues of the world. During the second quarter of the century, apparently with the help of Korean artists, the old style was modified to fit a wood technique, resulting in several marvelous statues—such as the Kudara Kwannon and the Maitreya or Miroku at Chūgūji—which differ considerably from their Chinese prototypes.

¹ The dates given to art periods in this section do not correspond exactly with those of the historical periods of the same name. They are necessarily arbitrary divisions, since uniformity among specialists has not been reached.

The only extant painting of the period, that on the Tamamushi Shrine, is obviously foreign. The well-known portrait of Shōtoku Taishi and his sons, though apparently a later copy, illustrates the contemporary style.

Hakuhō Period (650-710).—This is a transition period. In its early stages native artists were apparently bewildered by a variety of Chinese styles, mainly Sui and early T'ang, which had been brought in from the latter part of Suikō onward. In an attempt to supply the constantly growing needs for Buddhist images, they produced many statues not wholly artistically integrated. In the middle Hakuhō period a very successful synthesis was obtained in such works as the small bronze triad in the Tachibana Shrine (now at Hōryūji), but this style was soon superseded by a new one, that of the middle T'ang.

The government was at this time trying to reform itself along Chinese lines and was looking forward to its first capital, Nara, which itself was being laid out on a Chinese model. In pursuit of this objective it brought over Chinese artists, who, among other things, produced the great Yakushi trinity at the Yakushiji. These magnificent bronzes, well over life size, represent T'ang sculpture at its height, and are particularly important because no large Chinese bronzes of this type have come down to us.

All extant painting of the period is also Chinese in type. The most important examples are the murals on the walls of the Buddha, or Golden, Hall (Kondō) of the Hōryūji. Their exact date is questionable, but it cannot be far from the turn of the 8th century. There seem to have been several artists employed, certainly not all Chinese, but there is no indication that any were natives of Japan.

Nara (Tempyō) Period (710-800).—Conditions in this period, especially during its first 50 years, were especially favorable for Japanese artists. The new capital was filled with temples, and under government direction Buddhism was spreading rapidly throughout the country. Great numbers of Buddhist images were needed, and needed in a hurry. To supplement the works in bronze and wood, new media, such as clay (built up around a wooden framework) and hollow dry lacquer (used especially for large statues to be carried in processions) came into fashion, and in these the native artists soon became masters.

The earliest clay images are almost pure T'ang, and the earliest known hollow dry lacquer was almost surely of Korean workmanship, but from about 730 to 750 a definitely Japanese style developed. It is marked by a tautness, a sense of power held in leash, which has often been compared to that of a coiled steel spring. It is especially evident in images of the more active minor divinities, such as Vajrapāṇi and the so-called Four Guardian Kings, and is so widespread that it must reflect a general ideal of the time. In the quieter divinities, it sometimes takes a form that is extraordinarily reminiscent of the Greek.

There seems to have been comparatively little work in wood, at least in the capital itself, and almost none in bronze. This last was presumably due to the scarcity of copper, enhanced by the determination of the emperors to build one gigantic central image of the Buddha Vairochana (Roshana), which took some 10 years to make and was finally unveiled in 752. This immense seated statue, called the Daibutsu (Great Buddha)

of Nara, had to be cast in sections, as it was some 53 feet high, and its making taxed the resources of the country. It has been so much damaged and repaired that little of the original remains save one knee and part of its lotus pedestal, but it was presumably T'ang in style. The incised engravings of Buddha groups and other figures on the pedestal are definitely T'ang. Japanese adaptations of T'ang are evident, however, on the bas-relief panels of a 15-foot bronze lantern standing outside the temple of the Daibutsu (Tōdaiji).

In 754 the arrival of the Chinese priest Ganjin (Chien-ch'en, d. 763) with many attendants, including sculptors and artisans, brought with it a new style, known as that of the Tōshōdaiji, the temple in which Ganjin was established. This style was marked by a continental massiveness and grandeur which greatly influenced the Japanese but was never thoroughly assimilated by them.

Painting of the period seems to have followed continental models, although it is not fair to judge it solely from the extraordinary collection of objects preserved in the Shōsōin (the repository of the Tōdaiji), as most of these had belonged to the Emperor Shōmu (r. 724-749) and include a disproportionately large number of imported articles. That there was at least some adaptation of foreign styles can be seen, for example, in the well-known late Nara portrait of Kichijōten (Śrī), who resembles a fairy princess in comparison with the ample proportions then in vogue for T'ang female figures.

Early Heian Period (c.800-c.980).—After the foundation of the new capital of Heian (Kyoto) in 794, there was a long period in which art, especially religious art, was rather stagnant. The revenues of the Nara temples were drastically reduced, and the great period of production for them was over. In Kyoto, in the early years of the 9th century, some statues were made which were rather curiously Bourbon and baroque, and the introduction of the esoteric sects (Tendai in 805, and Shingon in 807) demanded images of a new type. In the main, however, there was little native development of Chinese prototypes, and most of the remaining examples seem ponderous and uninspired.

Buddhist statues, now mostly of lacquered wood, often have a sensuous surface, but they tend toward obesity. Many have well-developed rolls of flesh around their waists. In many paintings, too, fatness seems almost an ideal. And it is significant that there is very little difference between the murals in the Daigōji pagoda (951) and those in the Murōji, painted almost exactly 100 years before.

There was apparently some development in secular painting, but none of it remains. Wonderful stories are told of such artists as Kōse Kanaoka (fl. 850-880) and Kudara Kawanari. Artistic criticism, however, was apparently not very highly developed at the time, since one of the tales is that the artist was actually able to sketch a recognizable portrait of a man whose name he did not know. Extant portraits of monks do not differ much in style from the beginning to the end of the period.

Two peculiar developments should be noted. One was an attempt to reproduce (at Katada) the cave sculptures of the continent. Several caves were hollowed out of a mountainside, and many stone statues were made. But the material

was unsuitable. Today the caves are no more than hollow niches, and most of the statues are in ruins. The other development was the production of Shintō statues. The earliest extant (probably about 890) are excellent examples of the cult of obesity, and the portrait of the war god Hachiman in the robes of a Buddhist monk is entirely Buddhist in style.

Later Heian (Fujiwara, c.980-c.1170).—The proper dates for this, as an art period, are debatable. It is probable that a secular art first developed in the confines of the highly cultured court circles, and that this then affected the religious art. It reached its highest expression in the 11th and early 12th centuries, and is marked by an extraordinary delicacy and refinement. Its ideal seems to be that of an otherworldly, unreal fairyland, and it is perhaps noteworthy that it seems to express itself better in two dimensions than in three. Even its best statues, lovely as some of them are, seem somehow reminiscent of paintings.

From the few examples of secular art still extant it can be seen that the characteristically Japanese style of painting known as Yamato-e developed in this period. It is based on color mass and outline and is splendidly exemplified in the illustrations for *The Tale of Genji* (c.1120), attributed to the artist Fujiwara no Takayoshi.

Religious art was greatly influenced by the rise of the Jōdo (Pure Land) or Amida sects, with their comparatively simple tenets. It becomes gentler and more human than in the previous period. Perhaps the most important single example is the Hōōdō (Phoenix Hall) at Uji (1053). Here a large central Amida is surrounded by masses of angels on clouds carved in high relief and set against the walls, while on the inner sides of the great wooden doors are paintings representing the coming of the Buddha and his attendants to the deaths of the nine classes of believers. There is considerable landscape which may be regarded as secular painting; much of it is very charming. This is definitely Yamato-e, uninfluenced by contemporary Chinese painting (Sung), but it is of interest that the wood carving, especially that of the angels and the halos, is extraordinarily like that of the stone carving then being done in Manchuria under the Liao. There is some suggestion of Liao technique in religious painting also, especially in the color and the profuse use of cut gold leaf (*kirigane*) in addition to the painted gold, but there is no doubt that the mass of Fujiwara painting was an indigenous development.

In the latter part of the Fujiwara period art seems to reflect the unsettled conditions of the country. In sculpture inspiration seems to fail, and there are indications of the coming of a new and more robust ideal, as yet imperfectly assimilated. A more active style of painting appeared, exemplified in such magnificent scrolls as those attributed to Toba Sōjō (1053-1140), where emphasis is placed on brushwork and strength of line. But the old ideals were by no means wholly suspended. The epitome of Fujiwara gorgeousness—though not, indeed, of its delicacy—comes in its last days, in the scrolls of the Lotus Sutra made by the Taira family about 1164.

Kamakura (c.1170-1350).—This was a time of robustness, vigor, and concern with mundane affairs. As an art period it extends about 17 years beyond the historical Kamakura period.

In sculpture a realistic, fully three-dimen-

sional style was introduced by Kōkei and further developed by a number of talented successors, chief among them being his son Unkei (d. 1223), Japan's greatest sculptor. His work shows the influence of Nara rather than of Heian, but has an added realism, force, and activity. He is most successful in his carving of human figures and the semihuman guardian divinities, less so in the necessarily more conventional Buddhas. His school continued with only gradually decreasing vigor until about the middle of the 13th century, after which it rapidly declined. Most of the statues made at this time were of wood. The most important bronze was the Great Buddha at Kamakura, some 35 feet high (1252).

In secular painting there was some magnificent portraiture, and a new type of narrative scroll was introduced by Mitsunaga (c.1173). These were practically books, with little or no writing, which told a story in one continuous picture, in fully developed Yamato-e style. The type was soon adopted for religious purposes also, and was produced in great numbers by many excellent artists throughout the period. Conventional book illustrating was of course not abandoned, but it, too, took on new qualities of vigor and realism.

Although there was a certain hang-over of Fujiwara ideals, especially in the capital city of Kyoto, even the more conservative religious painting soon developed new ideals. Amida begins to come to the deathbeds of the faithful not softly, but on great whirling clouds, and new subjects become popular, such as the great Yamagoshi Buddhas rising from behind the mountains, and paintings of the Bodhisattva Monju (Mañjuśrī) crossing the sea bringing wisdom to Japan. Shintō painting, in a rather curious combination of Buddhist and secular styles, also became more common.

The beginnings of a new Chinese (Sung) influence on painting is discernible as early as 1192. It gradually increased but did not become dominant until the Ashikaga period. In general the unrest brought on by the attempts of Kublai Khan to invade Japan did not affect painting as much as they did sculpture, but it, too, gradually lost its vigor. Toward the end both seem to reflect the national weariness with war, to become meticulous and tangled in detail.

Ashikaga (1350-1570).—From the point of view of the history of art the most important happening in the Ashikaga period was an enormous increase in the popularity of Zen Buddhism. The traditional types of Buddhist art were still used by other sects but they became formalized and repetitive. Life went out of them. The traditional secular art was also affected, increasing in quantity, but gradually decreasing in quality.

In sculpture the only advance was a type originated to portray Zen abbots, and the first exponents of a new style of painting were all Zen monks. Many of these monks journeyed to China and brought back with them Chinese paintings, both religious and secular. Zen religious painting was wholly different from the previous types and was not primarily concerned with Buddhas. It might show arhats (*rakan*), or sages, but tried above all else to suggest the unity of all things, animate and inanimate, and it tended to do the suggesting in the simplest possible way. Hence most Zen paintings have little color and much blank space, and many of the finest are simple ink line and wash (*suiboku*).

The preferred Chinese paintings were those of the Sung period, not contemporary, and these were collected not only in monasteries but also by the nobility. The Japanese at first tended to copy these, or at least their type. There were many famous artists of this time painting these "Chinese" pictures (*Kanga*), but unquestionably the greatest was Sesshū (1420-1506). Though inspired by China, he was in no sense a copyist, and he exerted an immense influence on subsequent painting in Japan.

Sesshū had few direct pupils and at his death several secular schools claimed to be his legitimate successors. Of these the most permanent was the Kanō, whose name has come to be almost synonymous with *Kanga*. The first artist of this school was Kanō Masanobu (1434-1530), but its real founder and the artist who gave it its distinguishing Japanese characteristics, was his son Motonobu (1476-1559). Motonobu had married into the Tosa family, the foremost exponents of Yamato-e, his wife being the daughter or, as some say, the granddaughter of Tosa Mitsunobu (1434-1525), the last great Yamato-e painter of the period. He himself sometimes painted in the "Japanese" style. His pictures, even those done in strictly "Chinese" technique, are not primarily religious in feeling, but are rather decorative, the product of an artist reveling in his medium and delighting in the natural scenery of his own country.

Momoyama (1570-c.1630).—This was the age of the warrior barons who had helped to unify Japan under Nobunaga, Hideyoshi, and Ieyasu, and who wished to enjoy the fruits of victory. The art they wanted and obtained reflected their desire for gorgeousness and was often barely saved from vulgarity by its vigor and ebullience. They could turn even the tea ceremony, with its canons of simplicity and refinement, into an occasion for ostentation, and though comparatively few in numbers, they provided work for many artists.

Momoyama was a time when great six-fold screens, often with gold-leaf backgrounds, might be ordered by the hundred pair; in general the objective of Momoyama art was that of sweeping decoration. Black-and-white painting was not neglected, and indeed could often be a most effective foil to the almost overpowering glitter of gold. The Kanō school continued dominant under the leadership of Eitoku (1543-1590) and his adopted son Sanraku (d. 1635), but there was room for other schools as well, such as the Unkoku and the Hasegawa, which claimed to be the artistic heirs of Sesshū, and the newer Soga and Kaihō, which also were developments of "Chinese" painting. In addition, there were, of course, fine artists who belonged to no school, such as Niten (1584-1645) and Shōkadō (1584-1639).

The history of Yamato-e from the end of Ashikaga through Momoyama is very complicated. Its great champion, the Tosa school, had gone into an eclipse, but its spirit had great influence on most of the contemporary schools. The fortunes of Tosa had been bound up with those of the aristocrats of Kyoto, and with the coming of peace it began to revive. This revival started with Tosa Mitsuyoshi (1539-1613) and continued with his successors. One important development of Yamato-e was the work of two outstanding artists, Tawaraya Sōtatsu (d. ?1643) and Honami Kōetsu (1558-1637). Their art was decorative

rather than profound, and their styles were too individual to allow them to found a school. Their work, however, has greatly influenced all Japanese decorative art down to the present day.

Sculpture had a certain renaissance, chiefly as an adjunct to architecture, in *ramma* (ventilation panels) and other decoration. The best-known artist was Hidari Jingorō (1584?-1634), who did much of the wood carving for the Tōshōgū, the famous memorial to Ieyasu at Nikkō.

Foreigners had reached Japan in 1542, and European art was brought in by traders and missionaries. A number of Japanese became fairly skillful in the techniques of oil painting, but most of their work was destroyed in the 17th century anti-Christian persecutions, and had little effect on Japanese art as a whole.

Tokugawa (Edo) Period (1630-1870).—The Momoyama type of art continued with gradually decreasing exuberance up to "gorgeous Genroku" (1688-1703). The shogun encouraged his vassals in nonmilitary spending, and it was a good time for artists. The Kanō school split into three slightly differing branches under Eitoku's grandsons, Tanyū (1602-1674), Naonobu (1607-1650), and Yasunobu (1613-1685). The Tosa school had an outstanding artist in Mitsuoki (1617-1691), and the decorative style of Sōtatsu was revived and extended by Ogata Kōrin (1658-1716).

A new non-Tosa Yamato-e, exemplified by the Sumiyoshi school, depicted scenes of the contemporary life of the people, usually at the orders of the shogun and other feudal lords. This was the forerunner, and may have been the origin, of the Ukiyo-e, a school primarily of, by, and for the common people, but in which a number of artists of samurai origin also played a part. The townspeople of the rapidly growing cities, particularly Edo (Tokyo), were enjoying more and more leisure and liked a pictorial record of their pleasures. As the demand grew, mass production became a necessity, and the work of the artists was printed, first in books and then in separate prints. The pioneer in this field was Hishikawa Moronobu (d. c.1694). About 1695, Torii Kiyonobu (1664-1729) began to make prints of actors, and his family, which had long been connected with the theater, soon became dominant in this field. These prints were in black and white, sometimes colored by hand.

Early in the 18th century the Kanō and Tosa schools declined, at least partially because many of the nobles and samurai, their principal patrons, were in great financial difficulties. They continued, however, to paint in the classical style, with great emphasis on technique, and many of the best subsequent artists were trained in their ateliers. Some of these artists, like Morikage (fl. c.1700) and Watanabe Shikō (1683-1755), developed their own styles but clung to more or less classical subjects; others, like Hanabusa Itchō (1652-1724) and Miyagawa Chōshun (1682-1752), tended to turn to genre.

There were other revolts against tradition, such as the so-called Nagasaki school, inspired by the work of contemporary Chinese artists, but the most important was the development of the *bunjinga* (literary man's painting). This was hardly a school, but rather a movement among poets, mostly of the samurai class, amateurs who drew their inspiration chiefly from Yüan China and placed their emphasis on emotion and spirituality rather than on technique. Its founder is

usually considered to be Gion Nankai (1677–1751). It is the most difficult of all Japanese painting for foreigners to understand, but it has had a great influence in Japan itself. Ukiyo-e printing—the antithesis of *bunjinga*—made considerable technical advances, and with the invention of color printing (about 1741) entered a new phase.

The latter half of the 18th century produced many important artists, chief among them being Maruyama Ōkyo (1733–1795), who started a new realistic school influenced by the works of contemporary Chinese and European artists which he had studied at Nagasaki. An offshoot of the Maruyama school (the Shijō) was founded in Kyoto by Matsumura Goshun (1752–1811), who also had studied under Yosano Buson (1716–1783), one of the finest of the poet-painters. Its combination of realism and spirituality was very popular and had much influence on Japanese painting in the 19th century. The Tosa and Kanō schools, though still alive, were dormant, but the Kōrin type of painting had an excellent exemplar in Sakai Hōitsu (1761–1828), and there were some very fine painters of *bunjinga*. European painting (*yōga*) was also attempted, based mostly on illustrations in books imported from the Netherlands. No great works resulted, but European perspective became more familiar to Japan.

This was the great period for Ukiyo-e color prints. The technique of full-color printing was first employed for calendar prints of 1765, and a succession of great artists designed figure prints. Suzuki Harunobu (1724–1770), Katsukawa Shunshō (1726–1792), Torii Kiyonaga (1752–1815), Kitagawa Utamaro (1754?–1806), Tōshūsai Sharaku (fl. 1794–1795)—they are known in the West as well if not better than in Japan. By 1800, however, the great day of the figure prints was over. After that time most of the work of Utagawa Toyokuni (1769–1825) and his followers shows garish color and confused design. In the 19th century there were two outstanding artists, Hokusai and Hiroshige, but most of their work was landscape, and out of the Ukiyo-e tradition. Katsushika Hokusai (1760–1849) was the great eclectic; Andō Hiroshige (1797–1858) was greatly influenced by the Shijō school, especially in his *kachō* (bird-and-flower designs).

The 19th century produced a welter of different styles, too many to mention in detail. There was a revival of “Japanese” painting (*fukko* Yamato-e); some excellent painters were developed in the Kanō school; the Shijō school continued with gradually decreasing popularity under Matsumura Keibun (1779–1843) and Okamoto Toyohiko (1773–1843) and their followers; Tani Bunchō (1764–1841), in his time considered the greatest painter in Edo, worked in many styles; and of the *bunjinga* painters, many, like Tanomura Chikuden (1777–1835), took their inspiration from China, while others, like Watanabe Kazan (1793–1841), were at least partially influenced by European art. The world of art reflected the confusion and lack of unity then more or less general throughout the country.

Modern Period (Since 1870).—Immediately after the Meiji Restoration there was great enthusiasm for foreign techniques, which were at first copied without complete understanding, and of course many excellent artists such as Shibata Zeshin (1807–1891) continued to paint in the traditional manner. Other outstanding artists

were Kanō Hōgai (1828–1888), Hashimoto Gahō (1835–1908), and Kawabata Gyokushō (1842–1913), all of whom were trained by Kanō masters and later developed their own styles. Hishida Shunsō (1874–1907), an artist of extraordinary promise who unfortunately died young, was somewhat more influenced by the West.

In the mid-20th century the art world was divided between Western- and Japanese-style artists, and at least the beginnings of a fusion were discernible, though it had not progressed to anything like a full synthesis. Most famous among the more modern Japanese-style artists have been Takeuchi Seiho (1865–1944) in Kyoto and Yokoyama Taikan (1868–1958) in Tokyo. It is difficult, and perhaps out of place here, to evaluate the living Western-style artists, especially since a number of the best known in the Occident, like Yasuo Kuniyoshi (1893–1953), received their artistic training outside Japan. It should also be noted that there has been a revival of color printing, some of which is very successful. See also sections on *Architecture*; *Religion*; article on CHINA—14. *Art*.

17. ARCHITECTURE. All Far Eastern architecture is based on the structural use of wood. The Chinese have exploited this material to achieve an ideal of discipline and clarity. Their grand plans face to the south, and are symmetrical about a central axis. The wooden framework is painted with formal designs in strong colors. Other materials heighten the impression of artifice: brilliantly glazed tile roofs, stone platforms and balustrades. Where the purpose is purely monumental, as in a pagoda, the design may depend entirely on masonry, or metal, or even porcelain. The Japanese, although they have been strongly influenced by the Chinese ideal, have steadfastly kept a preference for opposite effects of irregularity and naturalness. Their deepest instinct has been to make a building at home in its natural environment, and to give it a kind of homeliness for human occupancy. When the instinct has been allowed full expression, this has resulted in an architecture that in farmhouse, mansion, temple, or palace has made an almost exclusive use of vegetable materials left in their natural colors: wood posts and planks, straw matting, bamboo, rice paper. Where tradition or aesthetic preference has outweighed the desire for fireproofing, the roof as well has been covered with thatch or shingles.

The history of Japanese architecture prior to 19th century westernization may be divided into three broad periods corresponding to the degrees in which native preferences have dominated. The first, down to around 600 A.D., was an age of slow advance from the primitive, stimulated toward the end by sporadic contacts with the mainland. The second, covering about three centuries, brought an amalgamation of Japan into the cultural orbit of China, and a resolute attempt to make over

Japanese architecture, like every other side of civilized life, on the Chinese model. The third has been a long backwash, in which the Chinese forms have been assimilated or abandoned, and a truly national style of high sophistication has been developed.

Early Native Architecture (to c.600 A.D.).

—No buildings remain from the first period, but it is possible to gain a fairly clear idea of their characteristics from secondary evidence. The earliest inhabitants of Japan whose way of life can be reconstructed, perhaps the Stone Age ancestors of the historic Ainu, have left in their settlements the traces of pit houses. In plan these are circular or squarish with rounded corners, around 15 feet across; the most pretentious have a rough stone paving around the central hearth. Post holes suggest a tent-shaped roof of thatch. That the ancestors of the Japanese preferred instead a building with a floor raised on posts (uncomfortable in winter, but preferable in humid summer) is attested by a variety of evidence. What seem to be farm dwellings and storehouses are represented in art toward the latter part of this early period, in line relief on bronzes and as three-dimensional pottery miniatures. Plans are now simple oblongs, with an entrance and windows on the long side. The most elaborate dwellings, with their platforms reached by ladders, and steep thatched roofs flaring widely at the gable peak, have a flavor of the Southwest Pacific that has encouraged theories linking the proto-Japanese to the tropics (see section on *The People*).

The look of these early representations recurs in the modern Shintō sanctuaries that more or less faithfully follow an ancient model. Of a half dozen, the most famous are those at Izumo and Ise, the latter having been identically rebuilt (at least in principle) every 20 years since its cult was standardized in 686. The series seems to show a gradual advance in design. The Izumo sanctuary is a big gabled box on a platform, entered from the end to one side of the ridge pillar, and with a pillar at the middle inside. Its form is only a stage beyond the tent-like bamboo shelters still used by harvesters. Intermediate sanctuary types gain formality by shifting the supports so a door may be centered. With the Ise Shrine (which may have taken form in the 3rd century) the building has been turned around so as to be entered at the middle of the long side, like the Chinese or Korean hall type that may have distantly suggested it. The Ise sanctuary shows most fully a complex of details that recur in part in the rest, and that testify to the preservation of primitive building techniques as a mark of holy antiquity. Most noticeable are the 10 heavy billets set crosswise on the ridge (originally to help weigh down the thatch, as may still be seen in back-country farmhouses); and the prolongation of the bargeboards as a fork high above each end of the roof.

In addition, the earliest Japanese histories contain scattered information on palace buildings. In the age of myth the marriage hut of the primal deities Izanami and Izanagi had a central pillar like the Izumo Shrine. In the last centuries of the period, when cultural infiltration from Korea had become a factor, the palaces are described with a new complication of plan, and with new features like towers. Throughout, the palace and the capital around it were lightly built for temporary use, since the death of the ruler would

require (at least in theory) a move to a new site.

Period of Dominant Chinese Influence (c.600–900 A.D.).—The opening of Japan to close contact with the brilliant civilization of T'ang dynasty China brought two new major architectural problems, the Buddhist temple and the formal, permanent palace-and-capital complex. The two varied only in dimensions and details, using almost identical building types and the same sort of symmetrical grand plan, laid out facing the south in enclosed courtyards, approached through monumental gateways. Building now became vastly more expensive, and served as the prime symbol of a new formality imposed on the life of the ruling class. The permanence required, and obtained by the use of stone-faced platforms, tile roofs, and much heavier timbers protected from weathering by paint, has incidentally resulted in the preservation of many buildings from this period, as well as the layout of two capital cities, Nara and Kyoto (then called Heian), and the group plans of a large number of Buddhist monasteries, followed throughout later rebuilding or still traceable on the sites. Most are in Nara or its environs. One monastery complex there, Hōryūji, still retains its major structures of the 7th century.

The Sinophile period of about three centuries, marked by an admiration that sometimes became a desperate race with T'ang achievement, reached its climax about 725–825. Beginning in 794, Kyoto was built as the last and most ambitious of a series of capitals on the Chinese model, with a regular checkerboard of streets and a central avenue leading from the palace compound on axis at the north. The essentials of the design are still visible in modern Kyoto, though human needs ran counter to symmetry in the city's later growth. The 8th century at Nara saw the number and size of Buddhist monasteries increase steadily, to a climax around 750–759 with the building of Tōdaiji: a huge central hall housing a colossal bronze Buddha, at the center of an *enceinte* as spacious as the imperial palace. The nation emerged from this fever almost bankrupt, fearful of the power wielded by the big metropolitan temples, and already half surfeited with Chinese ways. Even at the climax of the imported fashion native taste was still stubborn. Below the top level, building in the old style continued; even the emperor, though he held court in Chinese robes in a T'ang hall of state, preferred living quarters of a more comfortable homeliness. At Kyoto there were no temples as oppressively grand as Tōdaiji; and Chinese influence ebbed there until around 900 a native reaction was unmistakable.

Surviving monuments show a progression from a 7th century style quite out of date by Chinese standards, to a full T'ang modernity reached by 750. Hōryūji derives through Korea from a north Chinese architecture of the 6th century. Its details show an archaic flatness and a liveliness of line that are the architectural counterpart of Northern Wei dynasty Buddhist sculpture. All architecture of Chinese inspiration uses regularly spaced wood columns in the plane of the wall, with some kind of bracketing above each column to support the heavy roof overhang. At Hōryūji this bracketing consists of only a single transverse beam, reaching out to support the purlin running along the eaves, and braced by a planklike corbel in the same plane, cut out with the fluid irregularity of a cloud pattern. In

the plane of the wall, on the other hand, and on the interior, the bracketing unit is quite different. The column, which in the 7th century has a fine entasis, is capped by a simple square capital. Into the top is let a sturdy bracketing arm, which runs out on either side to end in a subtly drawn curve. There are three bearing blocks like small capitals, one at each end of the arm and one at the middle. These carry the beam above, part of the upper wall system, or in the interior the support for a ceiling. In the mature T'ang style followed in the 8th century, the bracketing over the column becomes a complex built out in three dimensions for maximum structural and visual effectiveness. The irrelevant cloud corbel is abandoned; and on the basis of an architectonic unit like the Hōryūji bracketing arm, the complex is constructed in orderly steps outward and sideways. At this stage the only intercolumnar support provided in the wall plane is a simple strut between two beams, or a bifurcated brace that the Japanese call *kaerumata* (frog's legs).

The original 7th century buildings at Hōryūji include: a pagoda; the Buddha Hall or Kondō (literally, Golden Hall); veranda corridors enclosing three sides of the courtyard; and a gateway on axis at the south. All rise from stone platforms and show similar details. Kondō and gateway are two storied (though the upper is not used), with a penthouse roof skirting the first floor and the whole crowned by the roof form called *irimoya*, which rises halfway as a hip and then becomes a gable. The pagoda is made up of five standard stories, square in plan, separated by the same skirting roofs, and diminishing as they rise. At the top is a typical spire, a mast fitted with superimposed metal disks and crowned by an openwork finial. In plan the only real problem is that of the Kondō, to provide a room for images and worship. At Hōryūji the solution is simple. The hall is five bays wide by four deep. Inside is a surrounding aisle under the skirting roof; in the remaining space, three bays by two, the other columns are omitted to make room for a platform, covered with images, and dignified above by a coved ceiling. The stage of development of the Buddha Hall is still so early here that a memory is preserved of ancient worship in India, where the focus of adoration was not an oblong altar with statues but a round stupa mound enclosed by a processional path. Thus the Kondō images face outward in all directions, only the principal Buddhas being oriented toward the south. It was natural in the Far East, however, that Buddhist worship should be modified by a secular ceremonial that insisted on a southward orientation. By the middle of the 8th century the Hokkedō (Lotus Hall) chapel at Tōdaiji has its altar platform closed by a partition at the back, and its images all face to the south.

The group planning of the monastery is seen earliest at Shitenōji (begun in 593), in Osaka. There the main axis enclosed by the courtyard and corridors holds first the gateway; then the pagoda; then the Buddha Hall; and finally, closing the rear, the Lecture Hall (Kōdō). The trend thereafter being toward a gradual reduction of the pagoda to secondary importance, its first demotion is to be removed from the axis. Hōryūji shows a unique variant in placing it and the Kondō to left and right respectively. Under the Chinese code of symmetry, however, a nonaxial element must normally be doubled.

That next stage may still be traced at Yakushiji (718) outside Nara, where a pagoda was set in each front corner of the courtyard. In the extravagant climax at Tōdaiji, the two pagodas were brought outside to balance on east and west, and were given their own small courtyard complexes. See also CHINA—Art.

Development of a National Style (from c.900 A.D.).—The indigenous reaction during the remainder of the period of Kyoto rule, under the Fujiwara clan down to 1184, took several forms. Though there were still large city temples, the greatest influence was exerted from the mountain headquarters of the new esoteric Buddhist sects, Hieizan and Kōyasan. In their surroundings irregularity of grouping and orientation was natural. There was a general drift away from mandarin formality toward greater comfort and intimacy. The mansions that in the Sinophile design called *shinden-zukuri* had been almost as strictly laid out as city temples lost their tight symmetry and began to ramble. Details were increasingly influenced by the instincts that had never entirely been suppressed. The first natural substitution was a wood platform floor in place of the tile or stone pavement. Construction became lighter; the bracketing was simplified. Buildings were often left unpainted, and were shingled more often than tiled. In this way palaces, temples, and mansions gradually took on a common character of domestic informality.

The most notable development in plan was the creation of a different Buddha hall type, under the pressure of new needs. The T'ang formula of altar platform and surrounding aisle had been adapted neither to elaborate ritual nor to a large lay audience. Both of these factors had a much greater importance during the Fujiwara period, particularly because the new esoteric worship insisted that ritual be performed unseen. The solution reached by about 1200 was a much more elaborate plan, with ample room for the laity in front in a spacious forechamber often the full width of the building, the so-called *raidō*. This public area was divided by a partition with doors or grillwork from the chancel beyond. In the latter a large floor area was left for ritual performances. Across the rear would run a shallow platform, with the main images often enclosed in cabinet shrines. Such a building, completed by a service room at the back, might be deeper than it was wide, in marked distinction to Chinese proportions. Where the 8th century hall had been symmetrical on both axes, this would remain so only in a left and right sense.

Under the military regime at Kamakura (1185-1333) two crosscurrents opposed the long ebb of the Chinese ideal. One, seen around Nara in the restoration of old monasteries, was a deliberate attempt to recreate the 8th century. The other, stronger and more widely felt, was a new stream of Chinese influence. Into Kamakura architecture were injected two alien styles from different regions of South China, inaccurately called "Indian" and "Chinese." The first featured a curiously graceless, powerful technique of bracketing, and was in general so unlike the taste of the time that its popularity was brief. Its most impressive surviving monument is the Great South Gate of Tōdaiji. The other, actually the imperial style of the Southern Sung dynasty, was a more complex and delicate version of the T'ang manner. Frankly ingenious in balancing the weights of interior framing by a system of

levers, it was characterized outside by one obvious change. The bracketing complex no longer rose only from the column top, but was repeated once or twice between with only a wall beam as support, thus transforming the under-eaves zone into a kind of continuous half-structural frieze. The "Chinese" style was an importation of the newly popular Zen Buddhist sect, and later kept much of its original purity in Zen monastic building, together with a standard Chinese group plan. Elsewhere both it and the "Indian" style soon lost identity, and in the end merely contributed a few new terms to the growing eclecticism of architectural decoration.

Post-Kamakura architecture has developed the trends already perceptible around 1200, without radical change. A huge popular place of worship of the 18th century, like the main halls of the Honganji in Kyoto, is hardly more than an enlargement of the mature Kamakura design. The whole temple compound will usually show the free placing made respectable by the old mountain monasteries. The principal novelty will be a great richness of sculptural decoration. Development in this last direction reached its extreme in the parvenu splendors of the 17th century Tokugawa tomb shrines at Nikko; while for more sophisticated patrons it provoked a reaction toward the equally exaggerated austerity seen in the rooms used for the cult of ceremonial tea.

The final flowering of Japanese taste has come with the type of house perfected in recent centuries. The building and its garden are drawn closely together by irregular planning and an absence of strict boundaries; sliding screens permit the rooms to be thrown together and interior to merge with exterior. All is light, and finely worked but simple in design; almost every surface is of vegetable origin, in its natural color. The pleasure taken in such an environment is so great that its charm has been borrowed for every other traditional building type. So completely has it satisfied the aesthetic sense that the Japanese have been willing to overlook its vulnerability to the annual problem of cold, and the periodic catastrophes of earthquake and fire.

18. LANGUAGE. The language spoken by the middle and upper classes in Tokyo is regarded as the standard language of Japan. It is universally taught in the schools, and is understood, even if it is not completely controlled, by most provincial speakers. This standard language has five vowels, with the qualities in *amah*, *machine*, *uhlan*, *beta*, and *note*. The vowels may be lengthened or may be paired in diphthongs. In rapid speech, *i* and *u* tend to disappear when they occur between voiceless consonants. The consonants are: *p*, *b*, *m*, *t* (*ts* before *u*), *d*, *n*, *ñ* (syllabic), *k*, *g* (nasalized when in the middle of a word), *s*, *sh*, *z*, *j*, *ch*, *h* (bilabial *f* when found before *u*; like the German *ch* in *ich* when found before *i* or *y*), *y*, *w*, *r* (flapped), and *v* (found in a few words borrowed from foreign lan-

guages). Consonants may be palatalized—that is, followed by *y*. The consonants *p*, *t*, *k*, *s*, and *n* may be doubled.

The accent is musical: a difference in pitch rather than stress is often distinguished between adjacent syllables of a word. Three levels of pitch are heard: low, middle, and high, with the intervals approximating that between one note on the piano and that which is two above it. Different pitch schemes distinguish words that are otherwise pronounced alike: *saké*, with the first syllable pronounced at low pitch and the second at middle, means "rice wine," whereas *sake*, with the first syllable taking high pitch and the second middle, means "salmon."

Grammatical categories fall into two groups, inflected and uninflected. The first group includes verbs, copulas, adjectives, and suffixes; the second, nouns, adverbs, and particles. There are four conjugations of verbs, two of which consist of one verb only: *kuru* (to come) and *suru* (to do). Two kinds of copula are found: one abrupt in connotation (*da*), and the other polite (*desu*). The forms of the adjective that may terminate a sentence end in *-ai*, *-oi*, *-ui*, or *-ii*. The word order is subject, object (if any), verb; subject, adjective; or subject, predicate noun, copula. Qualifying words and phrases precede the words they qualify. Particles follow the words, phrases, clauses, and sentences they govern. There are various levels of politeness, depending on the relative social standing of the speaker, the person spoken to, and the persons or things spoken of.

The characters used in writing the Japanese language are of three types: the kanji, which are the more complicated characters borrowed from China (see CHINA—Language); the katakana, which are syllabic characters that are angular in shape; and the hiragana, which are syllabic characters that are cursive in shape. The katakana and the hiragana each number 48; there is a one-for-one correspondence between the two types. The kanji are used to express the chief meaningful elements, such as nouns and the basic root ideas of verbs and adjectives. The katakana and hiragana are phonetic and are used to express the categories whose chief function is grammatical—that is, the syllables which comprise the particles and suffixes. In a typical text only kanji and hiragana are used; katakana are employed to represent foreign words borrowed into Japanese. In most texts these characters are arranged in vertical columns and read from top to bottom, right to left. In a few reference works and scientific texts, however, the arrangement is horizontal, as in English, and the characters are read from left to right, top to bottom; this method permits the inclusion of Roman letters, Arabic numerals, mathematical and chemical formulas, and the like. When written with brush or pen, characters may take the following forms: *kaisho*, or angular writing; *gyōsho*, a somewhat cursive form; and *sōsho*, the most abbreviated and cursive form.

The written language of the earliest times probably closely represented the colloquial. By the 9th or 10th century, however, the spoken and written languages began to separate. The spoken form changed rapidly; the written form was much more conservative. Hence, until the end of World War II, most materials intended for adult reading contained sizable numbers of linguistic forms that had long since been lost in speech. An example is the use of *yukan to su*

(to try to go) instead of the colloquial *ikō to suru*. The use of such constructions peculiar to classical grammar, the large number of arbitrary spellings that had developed in the supposedly phonetic kana, and the need of knowing a great many kanji—perhaps 2,000 to 2,500 before fluent reading could be achieved—meant that the load on the reader's memory was particularly burdensome. Various reforms have thus been suggested. These look forward to the colloquialization of the written language, reduction in number of kanji, the use of phonetic spellings in kana in place of the older historical spellings, and greater use of romanization.

Bibliography of Works in English.—Sansom, G. B., *An Historical Grammar of Japanese* (Oxford 1928); Yamaguchi, J. K., *Introduction to Japanese Writing* (Ann Arbor, Mich., 1942); id., *Modern Conversational Japanese* (New York and London 1942); Henderson, H. C., *Handbook of Japanese Grammar* (Boston 1943); Elisséeff, Serge, Reischauer, E. O., and Yoshihashi, T., *Elementary Japanese for College Students*, 3 vols. (Cambridge, Mass., 1944); Yamaguchi, J. K., *The Modern Japanese Written Language* (Ann Arbor, Mich., 1945); Bloch, Bernard, and Jorden, E. H., *Spoken Japanese*, 2 vols. (New York 1945-1946).

19. LITERATURE. This section traces the development of Japanese fiction, drama, and poetry from their beginnings to the mid-20th century.

Fiction.—The earliest extant Japanese narrative materials are found in the *fudoki*, or provincial records, which were compiled in the early 8th century; and in the chronicle entitled *Kojiki* (*A Record of Ancient Matters*), traditionally dated in the year 712. These texts record with great simplicity the legends and traditions that had been handed down orally from generation to generation. In the *Taketori Monogatari* (*Tale of the Bamboo Weaver*, 9th century) a superlatively beautiful heavenly girl is found between the nodes of a bamboo stem. When she grows up, five suitors seek her hand, and each is sent forth on an impossible quest. The *Utsubo Monogatari* (end of the 10th century) also uses fabulous material. A more realistic approach is taken in the *Ochikubo Monogatari* (written before 999), in which a beautiful girl is harassed by a wicked stepmother. Meanwhile, the *Ise Monogatari* (c.877) and the *Yamato Monogatari* (c.950) reflected the great vogue of poetry, telling a series of amorous incidents, each centered around an example of the tanka, or 31-syllable poem. Anecdotal and poetic materials were also used in the *Tosa Nikki* (*Tosa Diary*), written about 935 by Ki no Tsurayuki; in the diaries of Murasaki Shikibu, Izumi Shikibu, and the author of the *Sarashina Nikki*, all court ladies of the late 10th and early 11th centuries; and in the miscellany entitled *Makura no Sōshi* (*Pillow Book*), written by another court lady, Sei Shōnagon.

The realistic and lyric strands were finally joined, with a heightened sense of psychological and narrative values, in the great story of courtly life, *Genji Monogatari* (*The Tale of Genji*), which was written by Murasaki Shikibu early in the 11th century. *The Tale of Genji* stands at the apex of the fiction of Heian times (784-1184). In this novel is told the early love life of the hero, Prince Genji, his exile to Suma and Akashi, subsequent recall, rise to the highest political offices of the kingdom, and solicitude

over all the women with whom he has been involved. As Genji grows older, and especially after his death, when the scene shifts from the capital at Heian (now Kyoto) to the hamlet of Uji a dozen miles away, the story becomes much more somber.

The tales and diaries of Heian times were for the most part written by women. Using the easily written hiragana (see section on *Language*), and enjoying considerable freedom of observation and experience in a highly literary and artistic atmosphere, the women of the court virtually monopolized the writing of fiction.

Later writers failed to match the special genius of these women. The collection of 10 short stories known as the *Tsutsumi Chūnagon Monogatari* (*Tales of the Middle Councilor of the Embankment*) was probably written between 1050 and 1250, most of the stories dating from the 11th century. They are distinguished by their comic, satiric, and ironic effects. The *Konjaku Monogatari* (*Tales Modern and Ancient*) is a collection of 1,200 stories, many of them having a Buddhist flavor. Another fresh departure was the *rekishi monogatari*, or historical tale, of which the outstanding examples are the *Eiga Monogatari* (*Tales of Glory*) and the *Okagami* (*Great Mirror*), both dating from the end of the 11th century and telling of the pomp and circumstance surrounding the greatest family of Heian times, the Fujiwara, especially as represented by its most eminent member, Michinaga (966-1028).

Literature decayed in the Kamakura age (1185-1333), which was ushered in by civil war between the Taira and Minamoto clans. The warrior on horseback and the fighting monk now took the center of the stage. Literature became sober and depressing, instructive and moralizing. Typical of the age were various polemical essays written by such religious leaders as Nichiren (1222-1282). Of greater literary interest is the *Hōjōki* (*Ten Foot Square Hut*), written in the year 1212 by Kamo no Chōmei (1153-1216), who records his life as a recluse, and the *Tsurezuregusa* (*Idle Jottings*) of Yoshida Kenkō (1283-1350), who gives his impressions of men, writings, and nature, with many nostalgic references to the life of Heian times. In this period the blending of Chinese and Buddhist words with the native vocabulary added a new vigor to the language, and the warring times gave to a new narrative type, the *gunki monogatari*, or war tale, its quality of strength and freshness. The best of these war tales was the *Heike Monogatari* (*Tales of the Heike*), written for the most part in the first two decades of the 13th century. Sentimental, high flown, and extremely rhetorical, these texts were intended, not to be read, but to be heard to the accompaniment of the *biwa*, or four-stringed lute, played by the *biwa hōshi* (*biwa priests*), who roamed the country and held their audiences in rapt attention as they chanted the fall of men in battle, thus in their way helping to crystallize and to idealize the code of the samurai-warrior.

The next great development in narrative writing came in the Tokugawa era (1603-1867). In the 17th century a peaceful rule, greater literacy among the middle and lower classes, the growth of a class of independent and professional writers, the development of the art of printing, and better facilities for transportation helped to spread fiction throughout the country. Edo (now Tokyo), the seat of the shogunate, began to rival

Kyoto and Osaka as a literary and cultural center. The writing was essentially in kana. The first works, reaching as far back as the end of the 14th century, were the *otogisōshi*, or elementary stories intended to amuse the uneducated. These developed into the *kusazōshi* (grass books) of the middle of the 18th century. Moral, romantic, filled with characters, and containing many twists of plot, they took such names as *akahon* (red books), *kibyōshi* (yellow covers), and *gōkan* (bound books), depending on the color and nature of their bindings. Branching out from this development were the *kanazōshi*, or writings in the syllabic script, and the *yomihon*, or reading books, both didactic types depending largely on Buddhist and Chinese ideas. The *yomihon* were distinguished by their use of ghosts and fabulous creatures. Kyokutei Bakin (1767–1848) was the greatest writer of this genre; his most famous work was the *Satomi Hakkenden*.

From about 1680 a worldly-minded genre known as the *ukiyozōshi*, or tales of the floating world, began to achieve great popularity. Ibara Saikaku (1642–1693) was the leading author; with great realism and in plain words he pictured the effect on family life of affairs in the demi-monde. In the 1750's the *sharehon* (wit book) continued the vogue of erotic writing; in this form the plots were for the most part developed by means of conversations. Another development was the *kokkeibon* (comic book), represented by the *Dōchū Hizakurige* (*Shank's Mare over a Road*), a story by Jippensha Ikku (1765–1831) in which two roisters of Edo, Yajirobei and Kitahachi, travel down the Tōkaidō (Eastern Sea Road) to Kyoto and become involved in all manner of comic misadventures. The love affairs of the sons and daughters of the merchant class are told in the *ninjōbon* (books of human feeling).

The lighter fiction of Tokugawa times lingered on into the period after the Meiji Restoration (1868), but with the impact of Western literature various new types began to flourish. Kanagaki Robun (1829–1894) and Yano Ryūkei (1850–1931) took Western political ideas as the themes of their novels. In the 1870's and 1880's the historical novels of the 1st Baron Lytton and the scientific novels of Victor Hugo were translated into Japanese and enjoyed great popularity. A major event in the history of the novel took place in 1885–1886 when Tsubouchi Shōyō (1859–1935) published his famous *Shōsetsu Shinzui* (*Essence of a Novel*). In this work, Shōyō struck a blow against the didacticism of earlier writers like Bakin and demanded clear objectivity in the description of human life. Shōyō's precepts were followed by Hasegawa Shinnosuke (1864–1909), who wrote under the pen name Futabatei Shimei ("Die and be done with you"). Mori Ōgai (1862–1922), a student of Goethe and inclined to follow a more subjective and deductive line of reasoning, also emancipated himself from traditional points of view.

The subsequent history of the novel is marked by the rise of many schools and writers ranging from realism to idealism. An early realist was Ozaki Kōyō (1867–1903). Among his successors were a group of naturalistic writers including Tayama Katai (1871–1930), Masamune Hakucho (1879–1962), and, for a part of his career, Shimazaki Tōson (1872–1943); and such modern realists as Kikuchi Kan (1888–1948), Akutagawa Ryūnosuke (1892–1927), and Yamamoto Yūzō (1887–). Among idealists may be mentioned Kōda

Rohan (1867–1947), Higuchi Ichiyō (1872–1896), Tokutomi Roka (1868–1927), and Kunikida Doppo (1871–1908), the Mita school headed by Mori Ōgai and Nagai Kafū (1879–1959), the Yōyū (leisure) school of Natsume Sōseki (1867–1916), the Shirakaba (white birch) school of Mushanokōji Saneatsu (1885–) and Arishima Takeo (1878–1923), and Tanizaki Jun'ichirō (1886–1965), an extraordinary exponent of art for art's sake. Christianity, proletarianism, and various other ways of thought and life were espoused by many writers.

Drama.—Examples of Japanese religious drama are the *kagura* and *saibara*, both of which date from the early Heian age and are still performed at Shintō shrines. The *kagura* (literally, "pleasing the deities") is a dance or musical performance that in some forms is purely religious and intended to supplicate the gods; in other forms it is partly ritualistic and partly intended for entertainment. The *saibara* (literally, "get-ready-horse music") is a less polished form presented after the *kagura* has been performed.

Early in the 7th century a religious dance using masks arrived from Korea. This was the *gigaku* (skillful music), which was meant both to add dignity to Buddhist ceremonies and to serve as entertainment. The *gigaku* was performed only until the 10th century. In the 8th century a continental form known as *bugaku* (dance music) had reached Japan. This was an elegant mask dance accompanied by many instruments. More methodical and better arranged than the *gigaku*, it is still performed under the name *gagaku* (refined music). Another development connected with Buddhism is the *ennen-no-mai* (dance of longevity), which is recorded from about the year 1000. It first consisted of a shapeless performance of dances and stunts presented by priests. Soon, however, it began to include Chinese verse, Buddhist stories, and Buddhist poems, called *imayō*, which were made up of 8 or 12 lines consisting alternately of 7 and 5 syllables. The *ennen-no-mai* finally developed a chorus and parts in dialogue. It has persisted to the present day.

Popular drama also had religious beginnings in performances involving supplications for success in farming, fishing, and marriage. The *demmai* (paddy field dance) and the *denka* (paddy field song) evolved into the *dengaku* (paddy field music), which was intended partly as a prayer for a plentiful harvest and partly as amusement for the farmers as they went about their planting. Later, acrobatic stunts were added. The *dengaku* lasted until the 19th century under the name of *dengaku no nō* (accomplishment in paddy field music).

In the 9th century a comic dance incorporating folk music was introduced from India by way of China. This importation was the *sangaku*, or scattered music. Performed at Shintō shrines, it was at first a combination of music, antics, and joking. As *sarugaku* (monkey music), it came to include singing and recitation; later it took the name *sarugaku no nō* (accomplishment in monkey music), and finally it became the major ingredient of the *no* (Jap. *nō*) drama. This drama of "accomplishment" took its present shape in the 14th and 15th centuries. It owes its development also to various elements derived from the *ennen-no-mai*: from the singing and dancing known as *shirabyōshi* (literally, "white rhythm"), which took its name from certain professional dancing

girls; and from various dances associated with particular shrines and festivals.

The sarugaku was the source of the type of chanting employed by the *biwa* priests who recited the more stirring portions of the war romances. It also helped to develop the *kyōgen* (crazy words) that became the comic complement of the no drama. The *sarugaku no nō* and the chanting of the *biwa* priests contributed to the eventual development of the *jōruri*, or marionette drama, in the 16th century. The *kyōgen* was a source of the popular dramatic form *kabuki*, whose literal meaning is "eccentricity," "impudence," or "abnormality."

The two major figures associated with the early history of the no drama are Kannami (1333-1384) and Zeami (1363-1444). The latter in particular rejected the lighter elements of the sarugaku, and he is held to be the father of the no. He was the ancestor of the Kanze school (the other major no schools are the Komparu, Hōshō, Kita, and Kongō). Elegant and slow moving, the no appeals primarily to the initiate. In a typical plot a traveling priest is met by a person at the scene of a famous action. As the two talk, the latter suddenly confesses that he is a spirit in disguise and leaves. When he reappears, he is found to be the hero or major figure who has made the place famous. He sings and dances the role he played in life in making the place a historic spot. A prayer by the priest finally sets the spirit to rest, freed at last from the *shūshin* (heart attachment) which had made him return. The elements of the no drama are contrary to realism. Its poetic qualities are enhanced by the dancing and singing of the chorus, and by a kind of aesthetic frenzy that seems to grip both performers and audience.

The *kyōgen*, in contrast, is a comic form depending on unexpected actions in more or less absurd situations. It is given as comic relief in a no program; its satire attacks both foolish masters and ignorant priests.

The *jōruri* has only one real home in Japan, the Osaka theater called the Bunrakuza. The *kabuki*, however, is popular everywhere. It is extravagantly produced and is spectacular to eye and ear. Living actors, all men, take the place of the dolls of the marionette drama, the acting is exaggerated, and the language relatively simple; the chorus and musical accompaniment add to the color and excitement. The plots take four typical forms: the *jidaimono*, or historical drama; the *sewamono*, or domestic drama; the *aragoto*, or rough mime; and the *shosagoto*, or more elegant dramatic dance. A principal motif of the *jidaimono* is loyalty to one's master; the most famous example is the *Chūshingura* (*Treasury of Loyalty*, or *The Forty-seven Rōnin*), which tells of the vengeance of the 47 samurai whose lord had been forced to commit harakiri. The drama in the *sewamono* arises from the fact that a love affair between hero and heroine is opposed by the parents of one of them. The clash between love and filial duty is most frequently resolved by double suicide, the lovers dying in the belief, fostered by Buddhism, that they will meet in the next existence. The acknowledged master writer of both the *kabuki* and *jōruri* is Chikamatsu Monzaemon (1653-1724).

In the 19th century, Kawatake Mokuami (1816-1893) preserved most of the traditions of the *kabuki*. Toward the end of the century the *shinkabuki* (new *kabuki*) attempted to free the

older style from its conventionalized subject matter, style, and acting. This new type was followed in turn by the dramas of the *shimpa* (new school), which took its subjects from daily life, used the spoken language in place of the older literary idiom, allowed for freedom in style of acting, and permitted actresses to appear on the stage. The modern theater was at last born in the first decade of the 20th century. Tsubouchi Shōyō, in his *Shingakugekiron* (*Argument for a New Drama*, 1905), fought against the sensationalism of the older theater and demanded sound characterization and coherent plots. He was soon followed by a naturalistic school, an idealistic school whose principal representatives were Mushanokōji Saneatsu and Arishima Takeo, a neorealist school made up of writers like Kikuchi Kan and Yamamoto Yūzō, a neoromantic school, and others. The result of these divergent trends is that the modern Japanese theatergoer may see a variety of types of drama—no, *kabuki*, *shimpa* plays, and the modern play, in all their forms. In addition, motion pictures have a popular following, especially in the principal cities.

Poetry.—Japanese poetry is characterized by the alternation of lines of 5 and 7 syllables and the terminating of each poem with a final 7-syllable line. The poetic effects depend on the combination of sounds, the musical accents of the words, and the flow of intonation, punctuated by pauses, from line to line, as well as on the handling of the images. The most popular poetic form, found from the earliest times, is the *tanka* (short poem) of 31 syllables, with five lines running 5-7-5-7-7 syllables. Longer than the *tanka* is the *chōka* (long poem), a general name for all poems containing more than five lines. A special form is the *sedōka* (literally, head-turning poem), a six-line poem with the syllables running 5-7-7-5-7-7. One half of a *sedōka*, running 5-7-7, is the *katuta* (half poem). In the 8th century a comic variety of *tanka*, the *haikai-uta*, arose; known as *kyōka* (crazy poem), it has persisted to modern times. A popular diversion of the Kamakura period was the joint composition by many poets of the *renga* (linked poem). Each *renga* was composed by a group of poets alternately contributing lines of 5-7-5 and 7-7 syllables. The first three lines—the initial contribution of the leading poet—began to achieve independent status in the 16th century. Known as the *hokku*, or *haiku*, it is the 17-syllable poem which, next to the *tanka*, is the most popular Japanese poetic form. In the 17th and 18th centuries a comic variety of the 17-syllable poem found its acknowledged master in Senryū (1718-1790), who gave his name to this form.

Japanese poetry is unusually elliptical. Among the special poetic devices is the *makurakotoba* (pillow word), a stock epithet, consisting usually of five syllables, which qualifies particular nouns. *Ashibiki no* (foot-dragging), for example, is applied to mountains. The significance of many pillow words, however, has been lost. The *jo* (introduction) is a long decorative phrase placed before a word; unlike the pillow word, it is not fixed in form, and it may run over many lines. Fortunately it died with the earliest long poems. The *kakekotoba* (pivot word), punningly used both at the end of one phrase and at the beginning of the next, frequently plagued the poetry of the late Heian era and after. An even more pervasive device is the *engo* (associative word), which is used in one part of a poem

with a specific meaning, but carries overtones of a second or third meaning because of its common association with words used in other parts of the poem.

The earliest poetry, still preserved in the chronicles of the 8th century, possesses the exuberant quality of speech. The earliest anthology is the *Man'yōshū* (*Collection of Ten Thousand Leaves*), compiled mainly in and after the year 759. Consisting of 20 scrolls and 4,516 poems which were written by poets in all walks of life, from emperors to farmers and guardsmen in the provinces, the *Man'yōshū* achieved early lyrical heights. Its spirit is characterized by great freshness, simplicity, and directness. The *Man'yōshū* poet was optimistic; he rejoiced in the colors and scents of nature and enjoyed the present moment. His favorite theme was love, but he also wrote many elegies, poems expressing homesickness, and nature poems, as well as poems of a humorous and even derisive cast; poems with a patriotic coloration; buoyant banqueting, drinking, and hunting songs; and poems inspired by various legends. The finest poets of the *Man'yōshū* are Kakinomoto no Hitomaro (662-c.710), a court poet best remembered for his lengthy elegies; Yamabe no Akahito (d. c.736), a superlative nature poet; Yamanoe no Okura (660-733), a Confucianist; and Ōtomo no Tabito (664-731), a poet known for the depth of his human sympathies.

The second great anthology was the *Kokinshū* (*Collection Ancient and Modern*, c.922). Its principal compiler was Ki no Tsurayuki (d. 946). Like the *Man'yōshū*, this collection is divided into 20 scrolls. The total number of poems, however, is only 1,111. Whereas the *Man'yōshū* contains 262 *nagauta* and 61 *sedōka*, the *Kokinshū* includes only 5 of the former and 4 of the latter. The tanka has thus become the predominant form. Of the 20 scrolls, 6 are devoted to nature poetry, and 5 to love poetry. There is a considerable loss in vigor. The poet is more reflective and pessimistic, more Buddhistic. In addition to Tsurayuki, who provided a preface which is the earliest extended treatise on native poetry, the priest Henjō (815-890), Ariwara no Narihira (825-880), and Ono no Komachi (d. c.890) are the leading poets.

The *Kokinshū* was the first of 21 anthologies whose compilation was decreed by various emperors. The last in the series was compiled in 1438. Each collection consists of 20 scrolls; the average number of poems is 1,600. Of all the 20 collections which followed the *Kokinshū*, however, only the *Shinkokinshū* (*New Collection Ancient and Modern*, 1205) achieved a degree of poetic excellence. The *Shin'yōshū* (*Collection of New Leaves*, 1381), was a private collection and not compiled by imperial command. It, too, contained poetry of excellent quality. A few major poets like the priest Saigyō (1118-1190) and Fujiwara no Toshinari (1114-1204) appeared, but the old flair was gone; poetry became the property of masters who professed to know its secrets but were completely obsessed by rules; the subjects became conventionalized, and, as in the case of the *renga*, poetry became a pastime rather than an art.

Signs of revival in the tanka form came in the 17th century, when the first great scholars of earlier literature began to imitate the poetry of Nara and Heian times. Toda Mosui (1629-1706), the priest Keichū (1640-1701), and

Shimokawabe Chōryū (1624-1686) imitated, not too consciously, the poetry of the *Kokinshū* and *Shinkokinshū*. Kamo Mabuchi (1697-1769), on the other hand, deliberately went back to the *Man'yōshū*. Motoori Norinaga (1730-1801) favored the style of the *Shinkokinshū*. Others, like Tachibana Chikage (1735-1808) and Kawagawa Kageki (1768-1843), imitated the *Kokinshū*.

The greatest poets of the time wrote *haiku*. The finest writer in this medium was Matsuo Bashō (1644-1694), who recorded impressionistically and thoughtfully his reactions to nature. Gentle and wise, he gathered a host of disciples. Taniguchi or Yosano Buson (1716-1783) was a painter-poet. His *haiku* dealt realistically with human affairs as well as with nature. Kobayashi Issa (1763-1827) is known for his humanity and pathetic quality. A sarcastic strain is found in some of his poems, but his sympathy for living things extended even to the fleas that infested his cottage.

The tanka and the *haiku* retained their popularity in modern times. A few of the tanka poets, notably those connected with the Outadokoro (Imperial Palace Poetry Bureau), worked along traditional lines. But the greater majority tried to renovate the tanka, joining various schools and publishing their poems in the magazines supported by these schools. The Asakasha (light fragrance school) was founded by Ochiai Naobumi (1861-1903), who was rooted in the classics but is also known for his romantic tone. Among his followers were Yosano Tekkan (1873-1935), known for his masculine vigor, Onoe Shibafune (1876-1957), known for his intellectual skepticism, and Sasaki Nobutsuna (1872-1963), known for his easy and graceful style and for his reflective nature poetry. Yosano Tekkan soon dissented from this group. Seeking for poetry the right to describe human life in all its emotional turmoil, seeking, moreover, the right to use a wide-ranging vocabulary, he headed the naturalists of the Shinshisha (new poetry school). In the magazine *Myōjō*, founded in 1900, he produced poetry of extreme emotionalism, glorifying love. Belonging to his school were his wife Akiko (1878-1942); Ishikawa Takuboku (1885-1912), in his earlier work; and Horiguchi Daigaku (1892-). A reaction set in with the Negishi school, founded by Masaoka Shiki (1867-1902) and named for the section in Tokyo in which he lived. Shiki was a superlative poet who preached reserve and decorum, realism and objectivity. He took the rhythms of the poetry of the *Man'yōshū* for his model; his leading followers are Shimaki Akahiko (1876-1925), Saitō Mokichi (1882-1953), Itō Sachio (1864-1913), and Nagatsuka Takashi (1879-1915). Their work is found in the newspaper *Nihon* and in the magazines *Ashibi* (1903-1908), *Akane* (1908-1909), *Araragi* (1908-), and *Nikkō* (1924-1927).

The *haiku*, too, had its adherents who were unable to strike out along original lines. Imitating Bashō and Issa, men like Setchūan Jakushi (1848-1908) were known as "masters of the commonplace." It was Masaoka Shiki who preached the renovation of the *haiku* as he did of the tanka. He called upon each poet to control his emotions, which were to be suggested rather than openly displayed. Using Buson as his model, Shiki strove for a sober and concrete notation. Shiki's principles were not completely accepted. Some felt that his emphasis on sobriety and

technique could lead only to the impoverishment of the *haiku*; they therefore espoused complete liberty of theme and technique. Also opposed to Shiki were certain poets who were academic in their leanings and tended to rely on studious research rather than on a creative spirit. Shiki's principles gained widespread acceptance with the publication of the journal *Hototogisu* (1897–), first edited by him and then by Takahama Kyoshi (1874–1959), but the Shinkeikō (new tendencies school), which was led by one of Shiki's former disciples, Kawahigashi Hekigodō (1873–1936), claimed for the *haiku* the suppression of all traditional ideas, even of the 5-7-5 line scheme, and other writers also claimed independence from Shiki's tenets.

One of the most important developments in the field of poetry came with the revival of the long poem. In the 1880's the first translations into Japanese of Occidental, especially of English, poetry suggested the creation of a poetic form of unlimited length. The resulting *shintai-shi* (new-form poetry) appeared in the collection known as the *Shintaishishō* (1882), which was fathered by three men: Toyama Shōichi (1848–1900), Yatabe Ryōkichi (1852–1899), and Inoue Tetsujirō (1855–1944). Fourteen of the works in this collection were translations from English, American, and French poetry, but five were original. The alternation of lines of 7 and 5 syllables reverses the usual 5-7 alternation; other poems were written with each of the lines containing 5 syllables or 7, and alternations of 8-6 and 7-4 syllables were also attempted. Each of the three translators provided a preface. Both by precept and by example the three men called for freedom in the choice of poetic subjects; in length, form, and scope; in the use of the modern colloquial idiom; and in the adoption of foreign models. The *Shintaishika* (1882) and *Shintai-shisen* (1886) followed shortly thereafter. The last dozen years of the 19th century were a period of great activity, with the poets aligning themselves in such groups as the Bungakukai (Literary Club), the Kokumin no Tomo (Friends of the People), the Akamonha (Red Gate School, consisting mainly of poets connected with Tokyo Imperial University), and the Wasedaha (composed of poets connected with Waseda University). Other schools rose with the dawn of the 20th century, so that the picture from about 1920 on is one of great confusion, with Whitmanesque, sentimental, symbolist, impressionist, and other schools vying with each other, and with the composition of popular poetry and of children's songs in form longer than the tanka.

20. HISTORY: FROM THE EARLIEST TIMES TO 1853. This section discusses the history of Japan to the final and permanent opening of the country to Occidental influence in 1853 by Commodore Matthew C. Perry (q.v.).

Prehistoric Japan.—Little is known for certain about the origins of the Japanese people. No Paleolithic remains have been discovered but there is good evidence to show that in prehistoric times the country was peopled by immigrants from several parts of eastern Asia, mostly of Tungusic origin, but some from southern regions. Neolithic remains show that prior to these migrations Japan was sparsely inhabited by ancestors of the people now known as Ainu, who are thought to be of proto-Caucasic origin. By the beginning of the Christian era the later immigrants had reached a fair degree of ethnic fusion and had acquired from China and Korea the rudiments of a metal culture. The Ainu were gradually pushed northward. See also section on *The People*.

Early History to About 400 A.D.—Archaeological evidence and Chinese records provide a picture of Japan in the first four or five centuries of our era. It shows a number of tribal communities competing with one another for influence or military strength. Those native chieftains who made the best use of new techniques acquired from Korean teachers were able in the course of time to outstrip their rivals; and before

long certain tribes or clans had achieved over others a measure of dominance which by the beginning of the 5th century had brought a group known as the Yamato people to a position of supremacy in central Japan. In the eventual recognition of the leader of one clan as the sovereign of the Yamato people we see the beginnings of the tradition of imperial rule in Japan. But despite the obedience nominally due to the head of the imperial clan the other clans claimed such a virtual independence that the history of Japan for many succeeding centuries is a record, on the one hand, of attempts by powerful clan leaders to supersede or to dominate the imperial clan and, on the other hand, of efforts by the imperial clan to form a centralized, monarchical state. Unity was not easy to achieve, since each separate clan was a self-contained patriarchal unit, composed of households of the same ancestry, all under the leadership of a hereditary chieftain. Its members tended to place loyalty to clan before the common interest of all clans, for family feeling was strong and it was reinforced by the worship of a tutelary deity, from whom the leader of the clan claimed descent.

A trend toward cohesion among the clans, however, was created by the need for unity in war, especially in campaigns on the Korean peninsula. There had been close and constant intercourse between western Japan and Korea since the 1st century A.D., and by the end of the 4th century Japanese armies were taking part in struggles between Korean kingdoms. These kingdoms were under strong Chinese influence, and by about 400 A.D., the Japanese, learning from Korean tutors, began to use the Chinese script. This was a turning point in the history of Japan, since it enabled the Japanese to adopt important features of Chinese culture which depended upon written documents.

Adoption of Buddhism.—Probably the most important borrowing to follow the adoption of a script was the introduction (about 552) of Buddhism, which was flourishing in China at that time and lately had been accepted in Korea. Besides being a strong civilizing influence, fostering the arts and promoting both religious and secular learning, Buddhism hastened political development by intensifying the conflict between conservative forces, which stood for the old tribal institutions, and progressive forces working for a centralized government. A struggle for power between contending clans turned upon the question of religion, and in 587, after a short and bloody civil war, the party which favored Buddhism gained the upper hand. When the reigning emperor had been murdered, the Empress Suikō was recognized in his place, in 593. During most of her reign, which lasted to 628, affairs of state were conducted by a regent, Crown Prince Shōtoku (d. 621 or 622), one of the greater figures in Japanese history. He promoted the cause of Buddhism and worked hard for political reform. In 604 he issued his "constitution" of 17 articles, a set of moral injunctions addressed to the clans. These contain a new view of the state, for they dwell upon duties as well as rights and enunciate clearly the ideal of a centralized state in which the great nobles exercise authority as servants of the throne. But the power of the emperor was not yet so firmly established as his prestige; and it was not until 646 that a further necessary step was taken by the issue of the Taikwa (Great Reform) edict, which introduced

a new system of central and local government, land tenure, and taxation designed to deprive the clans of their autonomy. Throughout the 7th century Japanese envoys, monks, and scholars visited China and returned with impressive accounts of that country under the Sui and T'ang dynasties. The fact that reforms were based on their reports enhanced in Japan the prestige of all branches of Chinese learning.

The Nara Period (710-784).—By 710 the first permanent capital of Japan was built at Nara, a beautiful city on the model of the Chinese capital at Changan (Sian), with palaces, official mansions, great monasteries, and pagodas filled with treasures of sacred art. (See sections on *The Fine Arts*; *Architecture*.) Here the emperors reigned and exercised a growing authority, though already one of the great clans, the Fujiwara, had made itself a power behind the throne. In the capital the arts and learning flourished as never before. Religion flourished too; the Buddhist church grew to such heights of influence as to threaten secular authority. It was largely to escape this danger that the court was moved from Nara to Nagaoka in 784, and then to a new capital, on the site of the modern Kyoto, in 794.

The Heian Period (784-1184).—This period takes its name from that of the new capital, which was called Heian-jō (Citadel of Peace). In these four centuries a new Japanese culture was formed by the incorporation of Korean and Chinese elements into Japanese life. After Japanese tradition had begun to reassert itself, the resultant product was something Chinese in form but Japanese in essence. As Buddhism grew in strength, a certain reaction in favor of the indigenous cult made itself felt. This cult was a simple pantheism, in which an essence of divinity was perceived in all natural objects as well as in the tribal ancestors. Japan was thought to have been founded by the Sun Goddess, Amaterasu-ōmikami, and the emperors were regarded as her descendants, while other clans traced their ancestry to other *kami*, or gods. The nature religion, called Shintō (the way of the gods) to distinguish it from *Butsudō* (the way of the buddhas), was the expression of deeply rooted sentiments. By the end of the Nara period a compromise had been found by regarding both gods and buddhas as manifestations of one truth. (See section on *Religion*.) This characteristic fusion of native and borrowed elements is exhibited in the institutional history of the Heian period. At the height of Chinese influence administrative systems closely following Chinese models had been introduced in the Taihō Code of 702 and the Yōrō Code of 757. But since the schematic methods of the Chinese did not suit Japanese tradition and temperament, the organs of central and provincial government gradually came under the control of the leading clans. The carefully devised systems of land tenure and taxation were weakened by the fiscal immunities which great nobles and monasteries acquired. Thus during the Heian period the institutions created by the Taikwa reforms were so changed in character that they retained only their names and little of their original substance. The clan spirit—the native tradition—had reasserted itself.

A similar trend is visible in literature and the arts. At first the native language was contemned, but Japanese poetry and prose came into

fashion by 1000, and such works as the famous *Genji Monogatari* (*The Tale of Genji*) represent the high-water mark of pure Japanese literature. Religious developments also, particularly toward the close of the Heian period, testify to a growing national pride and to a desire to stamp with a Japanese imprint the foreign doctrines which hitherto had dominated intellectual life. This is particularly true of the sects devoted to the worship of Amida, which, arising from a need for simple doctrine to replace the abstruse teaching of the older sects, had acquired by the end of the Heian period a distinctive Japanese character; and it is true in varying degree of all subsequent versions of Buddhism in Japan.

The last, and perhaps the most important departure from the Chinese pattern, is visible in the political history of the late Heian era. Strife between factions for the control of the emperor, beginning with palace intrigues, broadened into civil war, in which first the Fujiwara lost their power and then the two great clans of Taira and Minamoto clashed until they met in a decisive struggle. The Chinese system of government collapsed, and the ancient rivalry of the clans was resumed. Both Taira and Minamoto were clans composed of fighting men who had established themselves in the provinces, acquiring and holding their land by armed strength. In the course of the 12th century they formed a class of warriors owing allegiance to their clan leaders rather than to the throne, and by 1185, after the final defeat of the Taira, the Minamoto house was supreme in Japan. Its chieftain Yoritomo (1147-1199) established his headquarters—the Bakufu (seat of military government)—at Kamakura, so as to be remote from court influence and to live among his important vassals, who were established in eastern Japan. Here began the final phase of Japanese history, which in one form or another lasted until 1868.

The Kamakura Period (1185-1333).—By the defeat of his enemies Yoritomo acquired in most parts of Japan great estates, which he distributed among his supporters as a reward for services in battle. In the course of his campaigns he had obtained from the emperor a commission to chastise the "rebels" and eventually was nominated (1192) Sei-i Tai-Shōgun (barbarian-quelling generalissimo), a title which first had been conferred upon the leader of an expedition against the Ainu in 794 and which gave its holder the command of all military forces in the empire. Like all his successors in this office, Yoritomo did not pretend to sovereign powers. He always observed forms of reverence to the emperor; and he was flattered by the grant of high court rank. He was careful to obtain the reluctant consent of the court to the appointment of constables and stewards throughout Japan. Yoritomo himself became constable general and steward general of the realm, thus gaining control of police affairs in each province and power to levy taxes upon all cultivated land, whether in public or private domains.

The creation of these new offices was the first phase in a long process by which the old bureaucratic system was replaced by an organized feudalism. To bring it to perfection time was needed. The first half century or more of the Kamakura regime was devoted to legislation devised to strengthen the ties of allegiance between the Minamoto house and its vassals by dispensing justice in disputes as to their rights

and duties and by creating a strong feudal hierarchy dependent upon a rigid code of loyalty. It was in this period that the code of military virtue—*Bushidō* (the way of the warrior)—became a coherent doctrine, embodied in the oaths and charters which defined the relationships between overlord and vassal, landowner and tenant, master and man. Among the fundamental documents of Japanese feudalism is the *Jōei Shikimoku* (*Formulary of Jōei*) of 1232, a set of rules and maxims which embodied the results of half a century's working of the feudal system. This was not presented as a national law, but only as the house law of the Minamoto family to be observed by its vassals. In effect, however, it displaced the old Taihō and Yōrō codes and in substance became the common law of Japan.

For nearly a century after 1185 the Kamakura regime continued peaceful and stable. After Yoritomo's death the Kamakura government was carefully administered by regents of the family of Hōjō Tokimasa (1138-1215), Yoritomo's father-in-law and one of his trusted allies. The Hōjō controlled the shogun just as Fujiwara nobles had controlled the emperors. But signs of discontent among the landed gentry were already visible in the early history of the Kamakura shogunate. The amount of land available was not enough to satisfy their growing families and the court was always ready to plot with disaffected feudal lords against the Bakufu. In 1274 the Mongol emperor of China, Kublai Khan, sent a great expedition to invade Japan. This was repulsed, as was a second attack in 1281; but the cost of defensive measures and the strain upon the resources of the vassals who had borne the burden of the attack were so great that the Bakufu, itself in financial straits, could not recompense its own supporters. Its authority diminished, and by 1333, under color of disputes as to succession to the throne, the capture and destruction of Kamakura brought the Hōjō regency to an end.

A new emperor, Daigo II (Go-Daigo, r. 1318-1339), occupied the throne and Kyoto was once more the seat of government. But he depended upon the support of a feudal lord named Ashikaga Takauji (1305-1358), who was made shogun in 1338. The Ashikaga family, after some 50 years of dynastic struggles, gained the upper hand over their feudal rivals and enjoyed a checkered and uneasy supremacy until about 1500, when sporadic feudal conflicts merged into a civil war which spread over the entire country.

Ashikaga Shogunate (1338-1573).—This period may be briefly dismissed as one of civil war, in which the remnants of the centralized rule exercised by the early Kamakura shoguns were discarded, and power was divided among a number of great barons over whom the Ashikaga shoguns held only a shadowy authority. Warfare was almost continuous, yet in the 14th and 15th centuries progress was made in many fields of endeavor. The movement of troops and supplies about the country improved communications and developed domestic trade; the shifting of allegiances, the collapse of old institutions, the use of new men dissolved the rigidity of the old social order and brought about a violent rearrangement of classes. It was an age of turmoil and of destruction, but not of decay.

Perhaps its most remarkable feature was the progress of the arts. The upstart feudal leaders used their newly gained wealth to patronize

artists and men of letters. Two of the Ashikaga shoguns in particular—Yoshimitsu (r. 1367–1395) and Yoshimasa (r. 1447–1474)—are celebrated as leaders of aesthetic coteries which displayed a great connoisseurship in the arts and developed an aesthetic tradition which has been a strong influence in Japanese life. (See section on *The Fine Arts*.)

It should be added that in this age there was close contact between Japan and China which, besides bringing to Japan many valuable examples of Chinese art, enlarged trade between the two countries. Ventures were undertaken by the shoguns, by great monasteries, and by feudal magnates, especially those in coastal provinces. There were also frequent voyages, many of which were piratical, to the Philippines, Indonesia, Siam, and Malacca. Japanese maritime enterprise grew steadily, and Japanese traders or adventurers were familiar with most Far Eastern ports by the end of the 15th century. The chief ports, notably Sakai, gained considerable autonomy and resembled in some ways the free cities of medieval Europe. What might have led to a great expansion of foreign trade and to the growth of a politically influential mercantile class was interrupted, however, by the course of political events at home, for by the year 1500 fighting between contending feudal powers, hitherto intermittent and local, had spread over all Japan.

The Warring Provinces.—The 16th century brought the final struggle for the redistribution of feudal power. Fierce, widespread, and protracted as it was, it must be regarded as a progress toward unity and order. Three great men were the successive architects of the centralized state which was to emerge in the 17th century.

The first was Oda Nobunaga (1534–1582), a small landholder who by skillful strategy was able to consolidate a strong position in the central provinces, to occupy the capital, and by 1568 to become the *de facto* shogun, though the Ashikaga were titular shoguns until 1597. Thereafter he, with his two celebrated lieutenants, Hashiba (later Toyotomi) Hideyoshi (1536–1598) and Tokugawa Ieyasu (1542–1616), set about subduing hostile barons east and west of the territory which he held. By 1582, when Nobunaga was murdered, they had between them overcome most of their enemies, who included not only feudal lords but also powerful Buddhist sects, whose monasteries had great military strength. It was in the extreme west of Japan, in the island of Kyushu, and across the straits on the mainland that some of his most stubborn rivals had their domains. To these regions there came about 1542 the first Europeans to see Japan—a few Portuguese, driven to shore in the province of Satsuma by stress of weather. They soon were followed by other Portuguese—traders and then Jesuit missionaries under the leadership of St. Francis Xavier.

Christian evangelization in Japan had a remarkable success, which was due largely to the untiring devotion of the Jesuit fathers. They were favored by contemporary political conditions, for the feudal barons soon perceived that Portuguese traders would come where missionaries were well treated and that the traders could furnish them with arms, ammunition, and other supplies, which would increase their military strength and give them commercial profit. Most of these rulers therefore treated the Jesuits well,

and some went so far as to order the people in their domains to accept the Christian faith. Moreover, many genuine conversions occurred, since the missionaries offered both spiritual and material comforts to the common people, whose condition in those times of civil war was wretched. Within 20 years of Xavier's arrival they had succeeded in making converts among the upper classes in central Japan, and in 1568 they were received by Nobunaga, who showed them some favors. His patronage, which owed something to his hatred of the insubordinate Buddhist sects, was of such value to them that by 1582 they claimed 150,000 converts.

Nobunaga was succeeded by Hideyoshi, who with Ieyasu's military aid continued the work of unification. Hideyoshi was now master of more than half of the Japanese provinces. He next reduced to such submission those great barons who still opposed him that by 1590 Japan was at peace for the first time in more than a century. Hideyoshi was a great man whose ambition was unbounded. Since he was of humble origin and could not aspire to the title of shogun, he was appointed to the ancient office of *kwambaku* (regent) and was in effect the ruler of the land. During his lifetime Hideyoshi laid the foundation of the new feudal edifice which was to be erected by his successor, Ieyasu. He put an end to the relatively free movement between classes which had developed under the Ashikaga shoguns (and to which he himself had owed his rise) by decreeing in 1586 that every man should remain in his own calling, whether peasant or tradesman or soldier. In 1587 he confiscated all weapons in the hands of peasants, thus emphasizing the distinction between the military caste and all others and making the sword a badge of rank. In general Hideyoshi legislated to preserve the balanced system of feudal power which he had erected. All his undertakings—his fortresses, his palaces, his entertainments—were on a grand scale. The Momoyama period (named after his palace at Momoyama in Kyoto, built in 1594) is distinguished for bold design and lavish execution, which reflect a certain heroic quality in the society of his day.

Hideyoshi treated the foreign missionaries well for some years. For a long time he had planned a war against China and he thought that the Portuguese might supply him with ships and guns. Although some of his ablest generals were converts to Christianity, Hideyoshi presently began to suspect that the missionaries were forerunners of armed aggression by Spain or Portugal and in 1587 without warning he issued an edict banishing them from Japan. This was not seriously enforced until after his expedition against China, which took the form of an invasion of Korea in 1592. After some preliminary successes this venture failed and the Japanese withdrew before a large Chinese army in 1593. A second attempt, made in 1597, was inconclusive and was abandoned on the death of Hideyoshi in 1598. It was in 1597 that persecution of Christians began at the order of Hideyoshi, who by then had judged from the behavior of Spanish Franciscans that Spain had designs upon Japan. Even so, after the first outburst, the anti-Christian edicts were not strictly enforced and the missionaries continued their work. By 1600 the number of converts had reached 300,000 and promised further increase.

Tokugawa Shogunate (1603-1867).—Ieyasu followed Hideyoshi in 1598, making his capital at Edo (Yedo), the modern Tokyo. His family, named Tokugawa, was of Minamoto descent. He was appointed shogun in 1603, after he had defeated at the Battle of Sekigahara (1600) a hostile combination of feudal lords who, though subdued by Hideyoshi, had never been reconciled to his supremacy. Ieyasu then redistributed the fiefs to ensure against further rebellion and by 1615 he disposed of the last of his enemies. Ieyasu died in June 1616, but he had already won for the Tokugawa family a dominance over Japan which was to last for more than 250 years.

Ieyasu at first showed no animosity toward the missionaries. He planned to encourage the growth of Japan's merchant marine and the expansion of her foreign trade. He went so far as to offer open ports in eastern Japan to Spanish vessels, and he made it clear that he would not enforce the anti-Christian edicts. But before long, growing suspicious of Christians in general and Spaniards in particular, he sought other channels of foreign trade. Having learned of the enmity between Catholic and Protestant states, Ieyasu gave trading privileges to the Dutch and the English and he began to turn against the Jesuits and the Franciscans. Some perfunctory bans against them were issued by him as early as 1606, but in 1615 severe persecution commenced. It was directed mainly against Japanese converts, and during Ieyasu's lifetime no foreigner was executed.

After his death his son Hidetada, the second shogun (r. 1616-1623), continued his father's policy of building a system of checks and balances which would make it difficult for the unreconciled barons to rebel against the shogunate. Since he saw that this system might collapse if those barons, some of whom favored Christianity, could obtain arms and ships and perhaps military aid from the foreigners, Hidetada accordingly ordered all foreign priests without exception to leave the country and ruthlessly persecuted all Japanese Christians. In 1624 under Iemitsu, the third shogun (r. 1623-1651), all Spaniards were deported. In 1637 a rebellion, in which Japanese Christians were implicated, began at Shimabara in western Japan, but was savagely repressed in 1638. Thereafter all Japanese were forbidden to travel abroad, all Portuguese were expelled, and other foreigners (Dutch and Chinese) were confined to a small area in Nagasaki where (and nowhere else) a very limited foreign trade was permitted. By 1640 Japan was virtually isolated from the outside world and Christianity was eradicated.

In this seclusion the Tokugawa rulers endeavored to fix society in one unchangeable pattern. They established in their own domains a strict official hierarchy and, though they left a measure of autonomy to the great feudal lords, they kept them under close watch, intervening when they thought it necessary. All vassals were obliged to subscribe to an oath of allegiance renewed with each change of shogun, and all were compelled to attend regularly at the shogun's court, leaving their families in Edo as hostages when they returned to their fiefs. The duties, privileges, and emoluments of each grade of the military class were minutely regulated, from the daimyō (daimio, or great feudal lord) down to the simple samurai (soldier). Below these ranked the farmer, the artisan, the mer-

chant, and, last of all, the outcasts, actors, butchers, and other workers in defiling trades; and legally it was not possible to move from one class to another.

These conditions persisted for a century or more after 1600. There were peace and order and firm, if harsh, government. The growth of great cities, like Edo and Osaka, and of a number of castle towns led to an increased demand for commodities and to the development of a more complex urban life than had been known. The townspeople developed a lively society of their own, which was devoted to good living and fostered popular arts: the theater, the novel, and the color print. Population continued to increase, reaching perhaps 29 million in the first quarter of the 18th century, but thereafter remained stationary, pressing upon the limits of subsistence and occasionally diminishing as a result of famine or pestilence, which occurred at frequent intervals until well into the 19th century. These economic disasters combined with other causes to weaken the system of government, which the Tokugawa rulers had endeavored to preserve unchanged. Contradictions inherent in that system were revealed with the passage of years. It proved increasingly difficult to maintain the prestige of a military class which was superfluous in time of peace, for the duties of most of the samurai were little more than nominal and their emoluments were a drain upon the national economy. Not only had the growth of urban life brought into prominence a class of merchants and bankers who thrived at the expense of their feudal masters, but also the penetration of a money economy tended to destroy the rice economy upon which the feudal system was based. To bolster its public finance the Bakufu resorted to depreciation of the coinage and forced loans, policies which in the long run increased the distress of the samurai. The peasants were overtaxed and agrarian risings were frequent. The merchants resented the levies by the authorities and their interference with trade. The intellectuals chafed under the restraints of orthodoxy.

Under Yoshimune, the eighth shogun (r. 1716-1745), these disruptive tendencies were checked for a while by measures of economy. Yoshimune relaxed the interdicts on Western learning which were part of the anti-Christian policy of the Bakufu, thereby unwittingly encouraging studies which led to discontent. Scholars began to learn Dutch and so to gain some knowledge of Western science. Samurai with active minds began to resent the strict class system, which denied them full use of their abilities, and to question the official school of Confucianism. Economists, dismayed by recurring famines and wild fluctuations in price, began to suspect that there was some fundamental weakness in the Tokugawa government. From this it was a short step to questioning the legitimacy of Tokugawa rule. All these currents of subversive thought were swollen toward the end of the 18th century by the arrival of Russian and American vessels off the shores of Japan. The Bakufu refused their requests for trading facilities and reissued the decrees against the entry of foreign vessels. An American vessel, the *Morrison*, was repulsed by gunfire in 1837. But foreign vessels continued to arrive, and the Bakufu, financially embarrassed and aware of the superior military strength of the Western powers, began to doubt whether the policy of se-

clusion could be maintained. In the clans and even among Bakufu officials there was a growing opinion in favor of opening the country, based on the conviction that Japan was weak and might renew her strength by the application of Western scientific methods to her military and economic problems. The Bakufu vacillated for a time and refused an invitation to open trade relations carried by United States warships in 1846. But when in 1853 Commodore Matthew C. Perry with a strong squadron arrived in Tokyo Bay and repeated the invitation, saying that he would come for an answer next year, it was clear that there could be no refusal.

21. DEVELOPMENT OF THE MODERN STATE (1850-1945). This section traces Japan's evolution from the decline of the Tokugawa shogunate, through the restoration of imperial authority and the adoption of Western institutions, to the totalitarian state of the mid-20th century.

Formation of a Constitutional Monarchy, 1850-1890.—Since 1850, Japan has undergone a complete cycle in its history. Both internal and external forces during the turbulent years of the mid-19th century resulted in the overthrow of the military dictatorship of the Tokugawa family, which had effectively forced its policies on the country for 250 years. New forms of a modern state, a centralized government, with a new constitution, universal education, a conscript army, modern systems of communications and transportation under governmental ownership, and a modern industrialized economy were substituted for basically feudal institutions and customs. A strong, closely knit empire slowly evolved to include the rich island of Formosa in the south and the Kwantung Leased Territory, the South Manchurian Railway zone, and the Korean peninsula on the Asiatic continent. Through conquest and the establishment of puppet governments direct Japanese control extended from the southern frontiers of the Asiatic continent to Kamchatka in the north. After the invasion of Manchuria in 1931, this new empire again fell into the hands of a military dictatorship, not of a single individual or of a single family but of an elite and powerful group of leaders from the army and navy supported by civilian industrialists and politicians. By Sept. 1, 1945, Japan had been completely defeated, its military machine smashed, its economy thoroughly dislocated and temporarily reduced to impotency, and its emperor and government made subservient to the authority of Gen. Douglas MacArthur as supreme commander for the Allied powers. Finally, its territory was reduced to that of the mid-19th century: the four main home islands of Hokkaido, Honshu, Shikoku, and Kyushu, and innumerable smaller islands lying within the traditional territorial waters of Japan.

In 1850 the traditional policy and strict enforcement of exclusion of Japan from the outside world, except for a few Dutch and Chinese traders, the continued concentration of political

power in the hands of a small group of warriors, the stratification of society, the inability to inaugurate basic economic reforms which would relieve the peasantry of the onerous task of being the main productive class, and the weaknesses inherent in a military dictatorship were ample cause for the collapse of the central government. Added to these factors were the requests of the Western powers (especially the Netherlands, the United States, and Russia), with their superior technical knowledge and their higher standard of living, that Japan sign treaties of peace and friendship. Nowhere is the inherent weakness of the Tokugawa government better revealed than by its action in 1853 following the demand of the United States, delivered by Commodore Matthew C. Perry and supported by a strong naval squadron which was to return the next year, that Japan be opened to American trade and that foreigners be allowed to reside there. The military dictator—the Tokugawa shogun (then Ieyoshi, succeeded that year by Iesada)—was unwilling and unable to decide the question alone and sought the opinion of all the feudal barons (daimyō), his allies and enemies alike. As less than a third of the barons opposed the American demands, as the Russians were simultaneously pressing for a treaty of peace and friendship, as Japan was impotent militarily and wished to avoid the semi-colonial status which the Western powers had forced on China, the first foreign treaty was signed with the United States at Kanagawa in 1854.

Many of the young warriors of this period had been influenced by nationalist scholars whose studies clearly showed that the real ruler of Japan should be the emperor. Those who lived in western Japan in the feudal domains of Satsuma, Choshu, Tosa, and Hizen (usually referred to collectively as Satcho Dohi) were particularly sensitive to such teachings, because their masters, though kept in unwilling obedience, had been the traditional enemies of the Tokugawa rulers. These men, who were to be the real leaders of the new Japan, had been exposed to the even more drastic teachings of nationalists such as Shoin Yoshida and Sanai Hashimoto. The former advocated military preparedness not only to expel the foreigners, but also to permit Japanese colonization of the surrounding islands and of Korea, Manchuria, and Formosa. The latter proposed a military alliance with Russia to safeguard Japan's position. Furthermore, such industrialization as then existed in Japan was largely concentrated in those same western domains of Satcho Dohi. Small iron foundries, reverberatory furnaces for the manufacture of guns, industries making silk, paper, sugar, glazed porcelain, and other products, and even the construction of a small steamboat gave the future national leaders the training which they needed for modernizing Japan.

The presence of the foreigners as a result of the treaties with the Western powers irked the nationalist-minded and arrogant Satcho Dohi warriors. They increased the antiforeign sentiment in Japan by their attack on the consulates and on individual foreigners without fear of retaliation from the tottering Tokugawa dictatorship. The foreigners refused to be intimidated, however, and undertook the chastisement of the culprits by naval bombardments of their fiefs. Finally, in 1867, combining the rapidly growing movement for the "expulsion of the foreign

barbarians (Americans and Europeans)" with that of the "veneration of the emperor," the Satcho Dohi warriors allied themselves with the emperor and forced the capitulation of the Tokugawa dictatorship. Emperor Mutsuhito (better known by his reign name of Meiji) was restored in 1868 as the actual ruler of Japan; minor military resistance to the Meiji Restoration, as it was called, was soon suppressed.

The first task of the new leaders was the abolition of the outward vestiges of feudalism and the establishment of a central government deriving its power from the emperor. Consequently they persuaded the feudal barons to surrender to the emperor the titles to their fiefs and to ask him to issue such decrees as were necessary to place the lands and people of the four Satcho Dohi clans directly under his authority. After many other feudal barons had followed their example, all the fiefs were formally abolished in 1871. In the next few years the support of the feudal barons and the warriors, whose annual income heretofore had been measured in terms of rice, was assured for the new government by the liquidation of their rice incomes, which were converted into government bonds. Meanwhile, the new government sent technical missions abroad to study European technology and institutions. Universal conscription and a modern army and navy, a uniform national tax on the value, not the produce, of the land, a national currency, railroads, the telegraph, a postal system, public utilities, universal education, and similar accoutrements of a modern state were inaugurated. The government either constructed at its own expense or subsidized those heavy industries necessary to develop a modern army and navy. The chief positions in the central government were filled by a few persons who formed a closely knit oligarchy that rotated from one position to another. Thus Gen. Prince Aritomo Yamagata first organized the army while war minister and then became home minister and premier (1889–1891; 1898); and Prince Hirobumi Ito first concentrated on finances and public works, then supervised the drafting of the constitution, and was premier four times in the period 1885–1901.

When the practical problems confronting the new state had largely been solved, the next big problem confronting the oligarchs was the formation of a constitutional government which would preserve the rights and powers of the emperor as an absolute monarch and also would satisfy the people's ever-increasing demands for a representative legislature. The prestige of the government and of the ruling oligarchs had been greatly enhanced by their ability to suppress a movement for the annexation of Korea and to substitute for it a relatively minor expedition against the Formosan aborigines. Furthermore, the new conscript army subjugated the formidable revolt of Takamori Saigo and his followers in southern Kyushu in 1877.

Ito, the leader of the conservative oligarchs, advocated a constitutional monarchy with absolute powers. The greatest challenge to this concept came from the leaders of two new political factions: the Liberals and the Reformers (Progressives). They urged a parliamentary form of government with a maximum of power concentrated in the hands of the people's elected representatives. This threat to autocratic control was met by the emperor's promise to establish a parliament by 1890, by the promulgation of

stringent laws to control the press and public meetings, and by the dispatch of a mission abroad under Ito's leadership to study foreign forms of government. He found the Prussian Constitution the best model to follow for the preservation of the throne's special characteristics and powers. Consequently Ito prevented public interference with his plans by drafting the constitution under the protection of the emperor through the Imperial Household Ministry. As president of the Privy Council, the highest body of advisers to the throne, he obtained approval for a constitution which placed absolute power in the emperor. It was promulgated to the people on Feb. 11, 1889. Furthermore, General Yamagata, who was minister of home affairs during this critical period, freely used the national police to suppress any signs of opposition by the people.

Henceforth, under the provisions of the constitution, which was never amended and was replaced only in 1947, the emperor was virtually the state. The military could circumvent the Cabinet by appealing directly to the throne, but the political parties in the lower house of Parliament could not insist on the premier being selected from the majority party, since Parliament did not have full budgetary powers and because individual liberties were greatly restricted. See also section on *Government*.

Emergence of Japan as a Modern Power (1890–1920).—With the completion of a political structure which assured the continued ascendancy of the clan oligarchs who had shaped the constitutional monarchy, the first 30 years of parliamentary government saw a vain attempt on the part of the representatives of the political parties in the lower house of the Diet to win control. The prime minister was chosen invariably from among the leaders of the Satsuma or Choshu (Satcho) clans and any obstreperous move by Parliament was countered by proroguing or adjourning it. Japan's position in the Korean peninsula, which had been steadily strengthened by intrigues with the opposing political factions within Korea, was challenged in 1894 by China, which refused to relinquish its long dominance over Korean affairs, and the oligarchs at home found the opposition to their rule rapidly increasing in Parliament. Furthermore, the military leaders were anxious to test the strength of their new army, and a new spirit of nationalism was engendered by a chauvinistic press and by an educational system which emphasized the subservience of the individual to the good of the state. As a result of the Sino-Japanese War of 1894–1895, Japan not only replaced China in the control of Korean internal affairs, but also secured the first of its overseas territories, the island of Formosa, and exacted from China an indemnity to cover most of the expenses of the war, which had been fought outside Japan.

Nationalism was stimulated further by Japan's experience with power politics as practiced by European states. China had awarded the Liaotung Peninsula to Japan at the Treaty of Shimonoseki in 1895. Fearful lest Japan usurp its position on the Asiatic continent, Russia persuaded France and Germany to join it in forcing Japan to relinquish this territory. After this bitter experience the nation as a whole was convinced that its new position as a world power could be maintained and strengthened only by the development of an armament sufficiently powerful to challenge any potential or real enemy or group of enemies.

It likewise saw the Western powers acquire leaseholds and military bases in China, and the United States develop into a colonial power through the acquisition of the Hawaiian Islands and the Philippines in 1898.

No objection was raised by the political parties to these wars. Moreover, no one challenged the assignment of a military officer as governor of Formosa or the fact that regulations were promulgated to restrict to the highest-ranking generals and admirals on the active list those eligible to serve as ministers of war or navy. This ordinance, which was rescinded only to be reissued, gave the military actual control over the Cabinet. When any Cabinet refused to obey their wishes, the military could order their representatives in the Cabinet to resign, thus causing its downfall. Likewise they could prevent formation of a Cabinet when the premier designate was unacceptable to them. Thus, when Prince Ito had formed a powerful political party, which gave him strong support in the lower house of Parliament, General Yamagata, who was the leader of the military group, feared that his powers might be checked. In 1901, after forcing Ito to resign as premier, Yamagata maneuvered the appointment of one of his protégés, Prince Taro Katsura, as the next prime minister. Even though Ito's party (the Seiyukai) won a majority in the next election (1903), Ito did not return to power.

This impotency on the part of Parliament and its lack of interest in opposing expansionism and Japanese designs on Korea led inevitably to the Russo-Japanese War (1904-1905). As in the previous conflict, the fighting was outside Japan. Southern Sakhalin (Karafuto) became an integral part of the empire and Japan replaced Russia in Manchuria. Meanwhile, through the Anglo-Japanese Alliance (1902), Japan had obtained an ally in the West. Through the formal annexation of Korea (1910), Japan secured its flank from attack, added roughly one third to both the area and the population of the empire, and acquired a colony with great economic potentialities.

Economically, the years following the Sino-Japanese War were a period of encouragement and growth of industry as a whole. The war indemnity reduced the need for foreign borrowing and made capital available for investment in new industries. Markets were extended and a general capitalistic expansion increased the concentration of wealth in the hands of a small privileged class. After 1905 domestic products were protected by tariffs and Japanese industries stood on an equal footing with their foreign rivals. Strategic industries were expanded, as evidenced by the growth of the Japan Steel Works and 35 other factories manufacturing arms, and all the important railroads were nationalized. Consumer goods, particularly textiles, appeared on the foreign market, so that the new industrial structure with its resultant products for export was to become a cause rather than an effect of war.

World War I afforded Japan another unique opportunity to increase its position as a world power. Militarily, Japan defeated the German forces in the Shantung Peninsula in China, and in the Pacific islands north of the equator. Politically, Japan assured confirmation of these conquests in the Treaty of Versailles through secret agreements with European powers. Despite the fact that the prime minister, Marquis

Shigenobu Okuma, had been the leader of the movement for a representative form of government, Japan consolidated its special economic and political position in China through the Twenty-one Demands in 1915 and later strengthened its strategic position by sending an expedition to Soviet Siberia. Economically, the war likewise provided Japan with an unprecedented opportunity. Its limited military responsibilities permitted the concentration of national energies on industrial production and expansion. During the war years new markets were acquired in Asia, Africa, Australia, and the South Seas. The production of silk trebled; the number of workers in factories employing over five persons doubled to more than 2,000,000. A prewar unfavorable trade balance was rapidly eradicated and Japan emerged from the war with a net credit on its international account of approximately 3,000,000,000 yen.

Rise of Nationalism and Defeat (1920-1945).—Immediately following World War I, Japan entered a period during which it was to have at least a minimum of experience with party governments. The first commoner to become prime minister, Takashi Hara, president of the Seiyukai, had come into power in 1918 on a wave of popular discontent with the high cost of living and of general disapproval of the oligarchs' policies. In the first postwar election his party received an absolute majority in the House of Representatives (283 seats to 176), and he confidently announced that militarism had been defeated.

Internationally, Japan appeared to have abandoned its aggressive intentions. It welcomed membership in the League of Nations. At the Washington Conference (1921-1922) it agreed to cancel the Anglo-Japanese Alliance, to withdraw from Shantung, to abandon its occupation of Siberia and northern Sakhalin, and to reduce its naval armaments. It acquiesced in the principles of no further fortifications in the Pacific and of equal opportunity in and respect for the territorial integrity of China.

Yet normal parliamentary government was to be hampered greatly by one of the most important, but unpredictable, characteristics of modern Japan—direct action by recalcitrant and disgruntled elements. Premier Hara was murdered on Nov. 4, 1921 by a railway employee who hoped by his action to attract attention to the corruption and degeneracy of the government leaders. His death was the signal for disintegration within the Seiyukai, so that the Cabinet was forced to resign in June 1922. The conservative advisers to the emperor disregarded the leaders of the political parties and selected the next three premiers from among the military. Simultaneously the Japanese were shocked by the passage of the Immigration Act of 1924, which excluded Orientals from the United States. A temporary collapse of the silk market and the overvaluation of the yen caused the rapid exhaustion of Japan's foreign credit accumulated during the war. Unrest among labor groups, "dangerous thought" among the students, and the fear of the results of universal manhood suffrage resulted in the passage of the Peace Preservation Law of 1925, which gave the police wide powers. Violent outbreaks in the lower house were commonplace; opportunism, not political principles, guided its members in their voting. Each of the two largest business combines allied themselves with one of the leading political parties.

Such was the generally unstable atmosphere existing in 1924, when the Seiyukai and the Minseito, the two principal parties, took turns in running the government for the next eight years. Even during this period only two premiers had a majority in the lower house. Premier Yuko Hamaguchi (1929-1931) obtained an absolute majority for his party (the Minseito) in the elections of February 1930. He openly challenged the military by insisting that the London Naval Treaty (1930) be ratified despite strenuous opposition from the Navy General Staff. Unfortunately for him and for liberalism in Japan, however, he came to power just when the world depression struck Japan. The loss of the silk market in the United States, the shrinkage of other foreign trade, and the government's policy of retrenchment and of return to the gold standard intensified the situation and created an atmosphere favorable to the growth of ultranationalism.

The cry of the militarists that Japan's economic ills could be cured only by direct action in China and by the exploitation of Manchuria fell on sympathetic ears. The wounding of Hamaguchi a few months later greatly simplified the task of the military in regaining control from the political parties. The constitutional provisions which gave them direct access to the throne and the lack of any provision for joint Cabinet responsibility to the Diet strengthened their position. Furthermore, developments in China played into their hands. Japan's monopoly of railway traffic in Manchuria through the Japanese-owned South Manchurian Railway was threatened by a complicated network of new Chinese lines. The Japanese guards along the zone of the railroad claimed that they were threatened constantly by Chinese bandits and that Japanese agents had been killed in the hinterland. Chinese unification was extending north of the Great Wall to such a degree that Chang Hsueh-liang, the Manchurian war lord, refused to make local agreements with the Japanese. Plans were carefully made and a simulated bombing of the South Manchurian Railway on Sept. 18, 1931 was the signal for the rapid and effective occupation of Manchuria by the Japanese Army. The organizers of this policy of direct action came to be known as the Manchurian clique in the army. Thus began the period of dual diplomacy: the Foreign Office placating the Western powers by statements which disclaimed any aggressive intentions of Japan in Asia; the military, largely guided by the Manchurian clique, slowly expanding their control through intrigue and by military campaigns.

The second prime minister during this short period of party governments to obtain an overwhelming majority in the Diet was Ki Tsuyoshi Inukai (1931-1932). His party (the Seiyukai) won the elections of February 1932, but the army already controlled Manchuria. Direct action at home also had its effects on the parties. In the same month Junnosuke Inouye, the campaign manager of the opposition party (the Minseito), was murdered by members of an ultranationalist group. Three months later Prime Minister Inukai was assassinated in an abortive coup d'état by another group determined to destroy the existing political parties, which it labeled as the enemies of the nation. His was the last party Cabinet, and Parliament became increasingly impotent and unwilling to check the spread of

militarism. In 1940 the political parties voted themselves out of existence and were replaced by the government-sponsored Imperial Rule Assistance Association, which assured the election of only those supporting national policy.

Moreover, whenever there was the slightest threat to the control by the military, direct action at home effectively eliminated the opposition or further expansion abroad placed Japan in an international position from which it became increasingly difficult to withdraw. The most violent of all the attempted coups d'état in those years occurred in February 1936. The ultranationalists had just received a thorough defeat at the polls. A moderate element within the army had attempted to remove some of the Manchurian clique from key positions. A group of young army extremists, aided by some of their superiors, decided that the time had come to seize the government by force. The result of this uprising was the murder of three senior statesmen who had opposed ultranationalist policies, and the wounding of others. Furthermore, the emperor's personal advisers and any other leaders holding moderate views realized that their lives were in danger if they opposed the extremists.

Meanwhile, the army and navy leaders lost no opportunity to convert all elements within Japan to their cause. They bombarded the conscript troops from the impoverished rural areas with pamphlets which extolled patriotism and sacrifice for the state and which insisted that Japan was destined to bring order and peace to the continent of Asia. It was argued that Japan must protect herself from within against the enemies of communism and capitalism by developing a powerful nationalistic government and must prepare for attack from without by relentlessly perfecting her military machine. The educational system was geared to this new concept of nationalism; the history texts concentrated on the divine origin of the emperor and of the empire; courses in "ethics" taught that the highest life for the Japanese subject was one in which he offered himself in perfect loyalty to the throne; teachers and professors who deviated from this line were summarily dismissed. Already in existence were laws which made it easy to control recalcitrant writers or any subversive elements. The government-owned radio also lent its aid. The labor movement, which never had been strong in Japan before World War II, became a willing supporter of the nationalist program. Agrarian unrest, which had been increasing during the depression years, was checked by promises that the expansion in Manchuria and in China would solve the problem of rural indebtedness and by the placing of local government officials in charge of farmers' cooperatives. In view of Japan's military tradition and heritage, it was comparatively easy to condition the people for a totalitarian state.

Several obstacles, however, still prevented the immediate formation of a completely totalitarian military state. First, the Manchurian clique lacked practical experience in organizing and operating a military state and were not yet in complete control of the army. Second, they had not convinced the conservative financial and industrial leaders (*zaibatsu*), that they would profit from expansion. Finally, the bureaucrats were still trying to sabotage the plans of the extremists.

The puppet government of Manchukuo (first

organized in 1932) gave the new leaders an opportunity to apply their most radical concepts of state control of industry. Here was a testing ground for a planned wartime economy, where they developed a plan for the expansion of strategic industries under governmental supervision and control and for the formation of semiofficial companies. The economy of Manchukuo was closely linked with the overall Japanese armament program. Its success contributed not only to the growth of a new group of industrialists dedicated to ultranationalism, but also to the prestige of the Manchurian clique within the army. Consequently the architects of Manchukuo later became the planners of Japan's wartime structure. Such opposition to the expansionists as had existed among the *zaibatsu* was silenced by the profits which they were making from the enormous expansion of heavy industries and from the insatiable demands of the army and navy for more goods. Furthermore, the *zaibatsu* saw their special position challenged by the new industrialists who had invested in Manchuria and in north China, and by the huge government-sponsored development corporations for each of the conquered areas. Consequently many of them accepted appointments to the nationalist Cabinets as ministers of finance, ministers of commerce and industry, or governors of the Bank of Japan. The managers of their leading subsidiaries were made presidents of the new control associations in their respective industries. Another potential source of danger to military rule had capitulated. Finally, the jurisdiction over all affairs on the Asiatic continent was wrested from the Foreign Office and was placed under the direct control of the military. Even the bureaucrats were powerless to object effectively to expansionism. Thus it was possible for Japan to develop into a military state within the framework of the constitution during the decade before Pearl Harbor. Elections were held, prime ministers were appointed by the emperor's advisers, and Parliament continued in session, but the dictatorship which finally emerged under Gen. Hideki Tojo as premier was complete.

On the international front the military leaders did not have matters so completely under control. They had underestimated the difficulty of conquering China, but used that as the excuse for the passage of the National Mobilization Law (1938). In the hope that a close alliance would develop between Japan and China, a Chinese puppet government was inaugurated (1940). To bolster this movement both at home and abroad, the prime minister expounded on the virtues of a new order for East Asia and a Greater East Asia Co-Prosperity Sphere under the aegis of Japan. After the outbreak of World War II in 1939, Germany and Italy put constant pressure on Japan to join the Axis. On the other hand, Germany and Soviet Russia had signed a nonaggression pact and Japan was reluctant to take any steps which would involve her in a war against the Soviet Union, especially after the sobering experiences of the battles on the Korean and Mongolian borders. Moreover, the subjugation of China was not complete and the new puppet regime at Nanking was not winning the support of influential Chinese. In July 1939, the United States had given six months' notice of its intention to abrogate its commercial treaty with Japan, which was a clear indication that it expected to embargo the shipment of war materials, including oil. To the army's desire

to expand on the continent of Asia was added the navy's compulsion to conquer the rich oil-fields in Southeast Asia.

It was no surprise, therefore, that Japan capitalized on the downfall of France by obtaining privileges in French Indochina from the Vichy government and by establishing military and air bases there (September 1940). In the Tripartite Pact concluded in the same month with Germany and Italy, Japan obtained from her Axis partners recognition of the new order in Greater East Asia under Japanese leadership and the promise of assistance in the event of war with the United States. Despite these developments, Japan still hoped for the impossible—namely, the capitulation of Generalissimo Chiang Kai-shek, the continued neutrality of the United States, and the promotion of economic cooperation between Japan and the United States. Consequently the ubiquitous Yosuke Matsuoka, who had led the Japanese delegation out of the League of Nations, had been president of the South Manchurian Railway Company and a staunch supporter of an aggressive policy in Asia, and had become foreign minister, attempted the unbelievable task of maintaining the Tripartite Pact and of reaching a settlement with China, the United States, and the Soviet Union. Friendly relations with the Soviet Union, which had been exemplified by the Soviet-Japanese Non-aggression Pact of April 1941, were strained by Germany's attack on Russian two months later.

Negotiations between Japan and the United States were begun, but it was soon clear that Japan was unwilling to abandon its expansionist policy. As the American proposals, which were based on the principle of respect for the territorial integrity of other states, were counter to all the basic moves taken by the Japanese military leaders since the invasion of Manchuria, it was impossible for them to reverse their position and still to remain in power. When an attempt by Prime Minister Prince Fumimaro Konoye to arrange a meeting with President Franklin D. Roosevelt in the summer of 1941 had failed, the final phase of the struggle within Japan between the military extremists and the moderates for the control of Japan's destinies was reached. On Oct. 18, 1941, Gen. Hideki Tojo became prime minister and appointed to his Cabinet those men who favored a totalitarian military state. Japan again had fallen under the complete domination of a military dictatorship. Plans already made for war against the Allies were then put into effect.

In less than two months Pearl Harbor and Manila were attacked and the United States entered the war against the Axis. Through unbelievably speedy military advances in the entire Pacific, the rapid amalgamation of the industries and resources of the conquered territories into Japan's war economy, and the complete control of the government over all phases of life at home, Japan threw the Allies off balance. But Japan could not withstand the slow, yet steady, pressure exerted against it on the sea and in the air by the Allies, principally by the United States, and finally agreed to accept the Allied terms in August 1945. When the Japanese representatives signed the Instrument of Surrender on the U.S.S. *Missouri* on Sept. 2, 1945, Japan admitted complete defeat, promised to abide by whatever orders Gen. Douglas MacArthur, the supreme commander for the Allied powers, might issue, and agreed to the dismemberment of its empire and to the return to its boundaries of a century earlier. See also

Professor of Japanese and Director of East Asian Institute, Columbia University.

22. FOREIGN RELATIONS (1931-1945).

—In 1931, Japan came to an irrevocable turning point in foreign policy. Late in 1929 the New York silk market had collapsed, bringing acute distress to the Japanese countryside, which depended heavily upon cocoons as a cash crop. The military leaders became concerned lest the economic crisis cause disaffection in the army, whose composition and outlook were largely agrarian. The situation also presented them with an opportunity to gain a political dominance which they long had sought and to discredit the civilian moderates, during whose brief ascendancy Japan had subscribed, in the treaties concluded at the Washington Conference (1921-1922) and the London Naval Conference (1930), to policies of self-restraint toward China and to limiting naval armaments. Military propagandists denounced the parliamentary parties and big business for allegedly exploiting the masses and betraying national interests, assailed the United States for discriminatory treatment of Japanese and for erecting tariff walls against Japanese manufactured goods, declared that Japan as a have-not nation must expand in order to survive, and proposed a program of social and economic reconstruction, of reactionary nationalism, and of a strong and independent foreign policy. The ascendancy attained by the army in the government was the key to Japan's international relations during the following decade.

Conquest of Manchuria.—In Manchuria stifening Chinese resistance to further Japanese penetration led to incidents and an accumulation of unsettled cases. Japanese military extremists agitated to have the army take the Manchuria question out of the hands of the Foreign Office. On Sept. 18, 1931 elements in the Kwantung Army (as the Japanese garrisons in Manchuria were designated), using a manufactured incident near Mukden (Shenyang) as a pretext, struck suddenly and proceeded to overrun and to subjugate southern Manchuria and some months later the entire territory. Popular feeling against Japan rose throughout China as a result of this so-called Mukden incident. In Shanghai a boycott against Japanese goods and a clash between Chinese and Japanese residents in January 1932 became enlarged until more than three Japanese army divisions and 3,000 marines were fighting the Chinese Nineteenth Route Army. In pursuance of a truce reached on May 5 through the intercession of the United States and other powers, the Chinese forces retired from the Shanghai area, after which the Japanese forces were withdrawn.

In Manchuria, however, Japan was not to be deterred from her course of conquest. A League of Nations commission, headed by the 2d Earl of Lytton, visited the Far East to make a firsthand

study and report. The Japanese government, though it accorded the commission adequate facilities for investigation, did not await its findings to execute Japanese plans. A puppet regime was created in Manchuria under the name of Manchukuo, which was given recognition on March 15, 1932 in a protocol defining Japan's special relation to the regime. The Lytton Commission's report, which appeared two weeks later, evoked bitter criticism in Japan, especially the report's denial of the plea that Japan had acted in self-defense, the finding that the creation of Manchukuo was contrived by the connivance of the Japanese Army, and the recommendations, implementation of which would have involved undoing the creation of Manchukuo. When the League of Nations Assembly adopted the recommendations (February 1933), Japan announced (May 27, 1933) her withdrawal from the League, effective at the expiration of the necessary two-year period. The League members and the United States withheld recognition from Manchukuo.

Sino-Japanese Relations, 1933-1937.—Between 1933 and 1937 the Japanese extended their aggressions from Manchuria farther into China. In January 1933 they occupied Shanhaikwan (Linyu) within the Great Wall. In rapid succession they conquered Jehol Province, which was annexed to Manchukuo, overran the eastern part of Hopeh Province, and forced upon the Chinese at Tangku a truce establishing eastern Hopeh as a demilitarized zone. In 1935, Gen. Yoshihiro Umezu exacted from Gen. Ho Ying-chin an agreement providing for the exclusion of the Chinese central government's troops from Hopeh and Chahar provinces, where a semiautonomous Hopeh-Chahar Political Council was constituted. Autonomous regimes were established under Japan's aegis in Inner Mongolia and East Hopeh, the latter becoming a base for smuggling Japanese goods into north China.

While Japanese military diplomacy, which was conducted independently of the Foreign Office, was thus active in north China, the imperial government had itself been moving toward a stronger foreign policy. On April 18, 1934, Foreign Office spokesman Eiji Amau emitted an official statement, known as the "hands-off China" statement, announcing that Japan would oppose certain types of third-power activities in China, such as political loans, military instruction, and joint projects of financial and technical assistance to China. Thereupon the United States reminded Japan that there were involved in the situation in China both American and international rights and obligations under international law and existing treaties. On December 29, Japan gave formal notice of her intention to withdraw at the end of 1936 from the Naval Limitation Treaty of 1922. After the lapse of that treaty Japan actively resumed the construction of capital ships to augment an expansion of armaments which had been under way for some time.

By 1936 mounting resentment in China against Japanese aggression resulted in growing Chinese unity and also in several incidents involving the killing or the injuring of Japanese subjects. When the Japanese ambassador in China sought, in conjunction with negotiating a settlement of the incidents, to dispose of "fundamental issues," the Chinese government refused even to discuss the questions of fiscal and administrative autonomy for the five northern provinces (in two of which, Hopeh and Chahar, this had been achieved

in fact), and of "joint Sino-Japanese defense against communism," a formula affording Japan a basis for asserting military control in north China. The Chinese in turn presented counter-proposals, which included cancellation of the Tangku truce and of the Ho-Umezu Agreement, dissolution of the East Hopeh regime, and cessation of Japanese smuggling. The negotiations ended in a deadlock. In December the National government and the Chinese Communists agreed to form a common front to resist Japan.

Sino-Japanese War.—A minor clash on July 7, 1937 between Chinese and Japanese soldiers at the Marco Polo Bridge near Peiping (Peking) brought the relations of their two countries rapidly to a crisis after the Chinese had refused to yield to Japanese demands for a local settlement which would confirm Japan's influence in north China. The Japanese made preparations to resort to force and the Chinese to resist. The Japanese government was unresponsive to an offer of good offices by the United States and sent heavy reinforcements to China. Soon hostilities became general and there ensued a conflict which influenced developments in Europe and four years later merged with World War II.

Japanese public opinion strongly supported its government, which remained united on objectives in China to the end of the war. On Sept. 5, 1937 the prime minister, Prince Fumimaro Konoye, informed the Diet that Japan's purpose was to force China to accept a basic readjustment of its relations with Japan, to which end the sole means then open to Japan was "to administer a thoroughgoing blow to the Chinese Army so that it will completely lose its will to fight."

The League of Nations Assembly's First Report on the conflict in the Far East, adopted Oct. 6, 1937, expressed the conclusion that Japan's military operations against China were out of all proportion to the incident which had occasioned these; that such action could not facilitate the friendly cooperation between the two nations which Japanese statesmen had affirmed was their aim; that Japan's action could be justified neither under existing legal instruments nor under the right of self-defense; and that it contravened Japan's obligations under the Nine-Power Treaty of 1922 and the Pact of Paris of 1928. The United States expressed its general concurrence with the conclusions of the League's Assembly. Nineteen nations in November 1937 participated at Brussels in a conference, held in accordance with a provision of the Nine-Power Treaty, to "study peaceful means of hastening the end of the regrettable conflict which prevails" in the Far East. The Japanese government's refusal to send delegates to the conference defeated the purpose to bring the conflict to an end through mediation and conciliation.

Japanese Rule in Occupied China.—In the areas of China which came under their military occupation the Japanese created regimes having a façade of Chinese control, but with real authority exercised by Japanese officials. The system offered a convenient subterfuge for disclaiming Japanese responsibility for infringement of the rights of third powers and for denying that Japanese assurances that they had no territorial ambitions had been violated. The Japanese government was thus also able to satisfy its own public that it had no enmity toward the Chinese people, but was combating only an anti-Japanese military leadership in the Chinese National government.

Japan's economic policy in occupied China early tended to establish such a general preference for Japanese interests as to deprive third-power nationals of equality of opportunity. Tariffs were lowered on Japan's staple imports, and discrimination in favor of Japanese enterprise was effected by the regulation, taxing, or prohibition of trade, by the imposition of exchange controls, and by the establishment of special Japanese-controlled companies, which were granted preferred status or monopolistic rights. As the Japanese armies advanced, they took possession of practically all publicly owned Chinese enterprise, such as railways, electric power companies, salt fields, waterworks, navigation facilities, and certain iron and coal mines, as well as industries which in large part were privately owned.

On Nov. 3, 1938, after the capture of Hankow and Canton, Japan announced that the Chinese National government had been reduced to a local regime and that it was Japan's aim to establish, in cooperation with China and Manchukuo, a new order in East Asia. On December 22, Prince Konoye announced Japan's peace terms, which were that China was: (1) to recognize Manchukuo; (2) to adhere to the Anti-Comintern Pact; (3) to accord Japan the right to station troops in areas to be stipulated by Japan (Inner Mongolia being designated as a "special anti-Communist area"); and (4) to agree to economic cooperation with Japan and to the extension of facilities for the Japanese development of natural resources (especially in Inner Mongolia and north China). This announcement was made by prearrangement with Wang Ching-wei, vice president of the Kuomintang, who had deserted the National government and was then in Indochina. On December 27, Wang declared that Konoye's terms were consistent with the principles of peace and proposed that the National government negotiate with Japan. As was expected, the National government ignored his appeal. Japan thus had prepared the ground for instituting on March 30, 1940 a Chinese regime in central China subservient to Japan, with Wang as its head. The Wang regime was recognized by Japan on Nov. 30, 1940 as the national government of the Republic of China in a "treaty" containing provisions substantially similar to the Konoye peace terms of Dec. 22, 1938.

Relations with Great Britain and the United States.—From the outset of the hostilities the rights and interests of third powers in China suffered from Japanese acts. British property interests in China were greater than those of any other power, but Great Britain was largely preoccupied with the crisis and the subsequent war in Europe. Consequently it was chiefly the United States that led in efforts to restrain Japan. On Dec. 12, 1937, Japanese aircraft bombed and sank the U.S.S. *Panay* in the Yangtze River under circumstances which pointed to either a deliberate disregard of consequences or negligence by some responsible person. The Japanese government called the act unintentional and made a prompt settlement, consisting of an expression of regret, assurances that measures would be taken against infringement of the rights and interference with the interests of the United States and other third powers, disciplinary action against the responsible commanders, and indemnification amounting to \$2,214,007.

The Japanese failure to keep the assurances given in connection with the *Panay* settlement

and the vain efforts by the United States to obtain the discontinuance of and redress for Japanese violations of American rights and the cessation of indiscriminate bombings from the air, which had caused the death of many thousands of the Chinese civil population and were jeopardizing the lives of third-power nationals, induced eventually, on July 1, 1938, the United States to place a moral embargo upon the export of aircraft and aircraft equipment to Japan. On October 6, in consequence of the Japanese government's continued failure to fulfill its repeated assurances to observe the principle of equality of commercial opportunity, the United States addressed to the Japanese government a comprehensive note on its discriminatory practices and interference with American rights and asked that these be discontinued promptly. The Japanese government's reply, on November 19, was an open challenge to the Western powers in the assertion of Japan's pretensions to the domination of China and it constituted a repudiation of the treaties concerning China. The note stated in part that Japan was devoting her energy to the establishment of a new order based on international justice throughout east Asia, the attainment of which end was indispensable to the very existence of Japan and was the foundation of the enduring peace and stability of that region. The conviction was expressed that in the new situation fast developing in east Asia an attempt to apply inapplicable ideas and principles of the past neither would contribute to the establishment of a real peace in east Asia nor would solve the immediate issues.

Since the Japanese note contained no satisfactory assurances for an amelioration of the situation, the United States on December 31 delivered to the Japanese government another note expounding more fully the American position. No reply to that note was made. On July 26, 1939 the United States notified Japan of its desire to terminate the Treaty of Commerce and Navigation of 1911. The United States reasoned that the treaty was not affording adequate protection to American commerce either in Japan or in Japanese-occupied portions of China, while at the same time the operation of the most-favored-nation clause of the treaty was a bar to the adoption of retaliatory measures against Japanese commerce. This notification came at a juncture when Great Britain was being subjected to pressure, through a partial blockade by Japan of the British and French concessions at Tientsin to surrender to a local Japanese-controlled court four Chinese whom the Japanese had accused of complicity in the murder of a puppet Chinese official. On August 18, however, the British ambassador informed the Japanese government that Britain would be unable to consider in a conference with Japan alone problems affecting the interests of third powers. It was not until a year later that the blockade at Tientsin was lifted, after the British had made substantial concessions to Japan. In July 1940 the British, under pressure of intense Japanese military activity near Hong Kong, agreed to stop the movement of military supplies from Hong Kong to Chinese territory and to close the Burma Road for the transit of certain war material for three months, on the understanding that during this period the Japanese would make a special effort to conclude a peace with China. On October 17 the Burma Road was reopened, since in the mean-

time Japan had made no serious diplomatic effort to come to an agreement with China.

Relations with the Soviet Union and Germany.—While Japan thus had been taking the offensive in China against the Western powers, she had been essentially on the defensive against the Soviet Union, at least after 1935, when Japanese pressure had effected the sale of the Russian interests in the Chinese Eastern Railway to Manchukuo. After the outbreak of the Sino-Japanese conflict, the Soviet Union, which viewed with concern the prospects of Japan's absorption of China, gave the Chinese government extensive aid in the form of military supplies and technical advice and by her military dispositions along the border immobilized in Manchuria a considerable part of Japan's best troops. An armed clash in July 1938 between Soviet and Japanese forces at Changkufeng Hill led to 10 days' fighting, and another clash in 1939 along the Mongolian border inaugurated extensive hostilities lasting from May until September. As a means of checking the Soviet Union, the Japanese Army, after the outbreak of the conflict with China, worked actively for a closer tie with Germany than that afforded by the Anti-Comintern Pact concluded in November 1936. Germany, which had extensive commercial interests in China, was none too pleased with Japan's program there and was willing to consider an alliance only if it assured Germany of Japan's support against Britain and France. Japan's civilian and naval leaders, however, opposed making commitments which might involve it in a European war. In May 1939, Baron Kiichiro Hiranuma, who in January had succeeded Konoye as premier, undertook a fresh initiative toward an alliance. Suddenly, on August 23, the conclusion of the German-Soviet Nonaggression Pact was announced. Germany's action without giving prior notice to Japan and the fact that the plea for an alliance had rested on its expected value against Russia resulted in the discrediting of the pro-German policies of the Hiranuma Cabinet and forced it to resign.

Expansion to the South.—The next Cabinet, under Gen. Nobuyuki Abe, sought a reorientation of policy toward the Anglo-Saxon powers, but this aim was foredoomed to failure, because Japan's "immutable" policy in China stood in the way of harmonious relations with them. After the outbreak of war in Europe on Sept. 1, 1939 the unconcealed eagerness in Japan to seize the opportunity thereby presented for the extension of empire southward was also an obstacle to good relations with the Western powers. The fall of France and the Netherlands in the spring of 1940 gave an additional impetus in Japan to the movement for southward expansion. As Britain and the United States stood in the way, they replaced Russia as the principal enemy in Japanese eyes. Moreover, as Germany now indicated that she no longer needed Japanese help in Europe, but wanted Japan to divert American attention from the Atlantic to the Pacific, the principal obstacles to an alliance were removed. Upon Konoye's resumption of the premiership in July, final negotiations ended in the signing of the Tripartite Pact on Sept. 27, 1940. Japan obligated itself thereunder to come to the aid of any of the parties thereto, if attacked by a power not at the time in the European war or in the Sino-Japanese conflict, other than the Soviet Union, which was expressly excepted.

Meanwhile, Japan had been pressing forward

in Indochina. On Aug. 30, 1940, a preliminary agreement was reached with France as a foundation for subsequent discussions. On September 22, three days after the issuance of a Japanese ultimatum, the French colonial authorities agreed to the Japanese use of three airports in Indochina and to the transit of Japanese forces for operations in China. Acting independently of the negotiators of the agreement, the Japanese Army in south China invaded Tonkin on the same day and five days of bloody fighting ensued.

After Germany's invasion of the Netherlands in May 1940, Britain, France, and the United States declared that they would respect the neutrality of the Netherlands East Indies. Japan gave similar assurances. Japan obtained from Germany assurances interpreted by Japan as giving her a free hand in the islands. In September a Japanese mission arrived in Batavia and demanded guarantees of delivery to Japan of 3,150,000 tons of petroleum products annually, an amount six times as large as the normal export to Japan, and extensive rights to exploit oil resources. The Dutch demurred and made a counteroffer beyond which they would not yield. Since the Japanese were not satisfied, the negotiations were suspended. Japan then sent to Batavia ex-Foreign Minister Kenkichi Yoshizawa, who in January 1941 presented far-reaching demands for special rights, which, if they had been accepted, would have placed the Indies under virtual Japanese economic control. When the negotiations reached an impasse, Yoshizawa returned in June to Japan empty-handed.

Japan's freedom of action for the southern enterprise was hampered by the undeclared and still unsettled war in China. China was receiving American, British, and Soviet aid. In July 1940, the United States had begun to deny licenses for the export of an expanding list of strategic commodities, including scrap iron, to Japan. Foreign Minister Yosuke Matsuoka made clear in the Japanese Diet on Jan. 21, 1941 that he would seek from the United States recognition of the vital concern to Japan of the establishment of the Greater East Asia Co-Prosperity Sphere, assent to Japan's supremacy in the Western Pacific, and cessation of economic restrictions upon Japan.

Japanese-United States Negotiations, 1941.—A new Japanese ambassador, Admiral Kichisaburo Nomura discussed in March and April 1941 with President Franklin D. Roosevelt and with Secretary of State Cordell Hull means of improving Japanese-American relations. He suggested the conclusion of a new agreement. Secretary Hull informed Admiral Nomura that the United States would consider any Japanese proposal for an agreement whose terms would be consistent with peaceful principles and purposes and that he would ask for assurances that the Japanese government had the willingness and the power to adopt those principles and to abandon its course of conquest. (During those two months Foreign Minister Matsuoka visited Berlin and Rome for the purpose of strengthening relations with the Axis. On his way home he stopped at Moscow, where on April 13 a neutrality pact between Japan and the Soviet Union was concluded.) Ambassador Nomura presented to Secretary Hull on May 12 a proposal for a general settlement, which was taken as a starting point for exploratory conversations, which were continued until December 1941. What the Japanese sought as

disclosed in that proposal and in subsequent formulations and clarification, was that the United States should stop interference, by its aid to the Chinese government, with Japan's efforts to impose a peace settlement on China on terms which had not changed substantially since 1936 and whose acceptance would have meant China's surrender of military and economic control of north China and of Inner Mongolia to Japan. Japan asked that normal Japanese-American trade relations be resumed and that the United States assist Japan to acquire rights to exploit natural resources in the Southwest Pacific. The United States made clear from the outset its unwillingness to discontinue aid to China and to be a party to a settlement between Japan and China which the latter could not accept freely by amicable negotiation. The United States expressed its readiness to offer its good offices for a settlement between China and Japan, to resume normal trade relations with Japan, and to assist Japan in endeavoring to obtain nondiscriminatory commercial access to raw materials in the Pacific area, provided that Japan abandon its policy of aggression, agree to respect in China the principle of nondiscriminatory treatment in international commercial intercourse, and make it clear that it was not under obligations under the Tripartite Pact to take action against the United States if the latter should be drawn by self-defense into the European war.

Germany's attack on Russia on June 22 precipitated an acute issue in the Japanese government on whether Japan should join the attack on Russia or complete the plan for southward expansion. The latter course was chosen at an imperial conference on July 2. Military preparations on a vast scale were launched, and soon a military movement into southern Indochina, which threatened the security of American, British, and Dutch possessions and vital trade routes south of China was begun. Secretary Hull suspended the exploratory conversations at Washington. On July 24, President Roosevelt proposed to Japan the neutralization of Indochina, but Japan was unresponsive to the proposal. On July 26, the United States froze Japanese assets in American territory, causing a virtual cessation of trade between the two countries. The British and the Dutch followed suit.

In August, following an initiative by Japan, the exploratory conversations at Washington were resumed and continued through the autumn. To a Japanese proposal for a meeting in the Pacific between the responsible heads of the two governments as a means of resolving the issues between them, the United States suggested that such a meeting should await agreement on essential principles and on their practical application. On November 20, Japan made what proved to be her final proposal. In it were repeated in blunt terms the essence of the demands from which Japan had never receded and there was no suggestion of any concession to the American views. The United States, after consulting with the British, the Australians, the Dutch, and the Chinese, answered Japan on November 26. The reply revealed the unacceptability of the Japanese proposal and contained what was essentially a summation of the American position which had been demonstrated fully. There was offered "for the consideration of the Japanese government a plan of a broad but simple settlement covering the entire Pacific area." On December 7, Am-

bassador Nomura delivered to Secretary Hull a communication containing an abusive tirade against the United States and announcing that Japan considered it impossible to reach an agreement through further negotiations. More than an hour before the delivery of this communication, Japanese armed forces had struck without warning at Pearl Harbor and had invaded British Malaya.

World War II.—Japanese armies proceeded rapidly to invade and to occupy American, British, and Dutch possessions in southeastern Asia and swarmed into Thailand, with whose government an alliance was concluded. Hong Kong fell on December 25, Singapore on Feb. 15, 1942, Batavia on March 5, Mandalay on May 1, and Corregidor on May 6. In the new acquisitions to the Coprosperity Sphere, much the same patterns were followed as had been adopted in China. In 1943, Burma and the Philippines were given "independence," but it was not until late in the war that independence movements were supported in Indochina and Indonesia.

After the loss of Saipan in June–July 1944, conviction of the inevitability of defeat began to grow in Japan, but the army had no plan except to fight to the bitter end. By the spring of 1945 leading statesmen reached the conclusion that in order to escape national annihilation peace must be obtained. In July, the Soviet government was approached with a view to its mediation with the Allies for a peace short of unconditional surrender, but the Soviet government rebuffed the approach on the ground that the basis proposed for peace was too indefinite. On July 26, the Allied powers issued at Potsdam a declaration outlining their terms of surrender to Japan. A few days later the Soviet government entered the war against Japan and adhered to the Potsdam Declaration. The declaration called for the limitation of Japanese sovereignty to Japan's four main islands and such minor islands as the Allies might determine, the disarming of Japan's military forces, the punishment of Japanese war criminals, the military occupation of Japan, and the eventual formation of a democratic government in Japan. Japan announced on August 10 its acceptance of these terms subject to the qualification that the emperor's prerogatives as sovereign would not be prejudiced. The Allies replied that the emperor's authority and that of the Japanese government would be "subject to the Supreme Commander for the Allied Powers, who will take such steps as he deems proper to effectuate the surrender terms." Japan accepted this answer, and on Sept. 2, 1945, Japanese representatives signed, on board the U.S.S. *Missouri* in Tokyo Bay, the instrument of surrender.

United States Foreign Service, 1909–1947.

was under foreign military occupation and subject to the orders of a supreme commander for the Allied powers (SCAP). It then resumed its position as a sovereign nation.

OCCUPATION

As defined in 1951, the Allied powers were the 55 nations (including some newly independent) considered to have opposed Japan in World War II. Most of them, however, had no voice in the occupation. The SCAP staff was almost exclusively American, and except for a Commonwealth of Nations force (Australian, British, Indian, and New Zealand) in the Hiroshima area, the occupying forces also were American. Plans to use Chinese and Russian troops were blocked by the outbreak of civil war in China and the Soviet rejection of United States command.

A total of 13 powers took part in international agencies established to deal with Japan. (The United Nations, as such, had no direct connection with the occupation.) An Allied Council for Japan, with one member each for the United States, the USSR, and China, and one for Australia, Great Britain, India, and New Zealand together, was set up in Tokyo to advise SCAP, but it had little influence on events. These 7 nations, plus Canada, France, the Netherlands, the Philippines, and, later, Burma and Pakistan, formed a Far Eastern Commission (FEC), with headquarters in Washington. FEC authority to determine occupation policy was limited by a veto power given to the United States, the USSR, Great Britain, and China, and especially by a provision that the United States could issue unilateral interim directives to SCAP on almost any matter not as yet decided by the FEC. These directives could not be reversed without United States consent. Most FEC decisions thus reflected policies already determined by the United States. Having borne the brunt of the war against Japan, the United States claimed predominance in the occupation. While this claim caused friction with other powers, it spared Japan the territorial partition and bitter impasses in policy that plagued occupied Korea and Germany in the postwar period.

Basic Policy.—The Cairo Declaration of Dec. 1, 1943, committed the United States, Great Britain, and China to punish Japanese aggression and to strip Japan of its conquests. In the Potsdam Declaration of July 26, 1945, these three powers (with the USSR later adhering) demanded an unconditional surrender and announced their intention of occupying Japan until certain broad objectives had been achieved. Acceptance of this declaration by Japan on August 14, formalized in the instrument of surrender of September 2, completed the legal basis for occupation. A United States Initial Post-Surrender Policy for Japan was sent to SCAP on August 29 (it was reissued by the FEC in 1947 with little change). Then, in November 1945, the United States issued a much longer Basic Initial Post-Surrender Directive to SCAP for the Occupation and Control of Japan, specifying major policies in detail but leaving SCAP large discretionary powers.

Planning for postwar policy toward Japan had begun in 1942. United States officials were deeply divided over the issue of a hard or a soft peace. The sharpest disagreements concerned the treatment of the emperor and the civilian leaders, especially the industrialists. Advocates of a soft peace argued that deposing or jailing the emperor

23. OCCUPATION AND FOREIGN RELATIONS SINCE 1945

From Sept. 2, 1945, to April 28, 1952, Japan

would produce chaos and hatred in Japan, jeopardizing both the safety of the occupying troops and the success of their program. Proponents of a hard peace considered the imperial system to be so closely connected with aggression that failure to destroy it would doom occupation reforms. A similar dispute arose over the wisdom of using Japanese civilian leaders to maintain a stable government and prevent economic collapse. Neither faction won a clear decision. SCAP applied a mixture of hard policies and soft policies, a procedure that at times resulted in compromise and contradiction.

It was agreed that Japan, unlike Korea and Germany, would retain its existing governmental machinery, both national and local. SCAP would rule not directly, but through the Japanese government. This decision reduced to manageable proportions the problem of controlling with less than 500,000 foreign troops an enemy nation of 80,000,000 persons. It relieved the occupation of responsibility for myriad day-to-day decisions and thus enabled SCAP to choose the times and occasions to intervene. On the other hand, it enabled some Japanese to obstruct SCAP orders, partly because the occupation never developed adequate machinery for verifying compliance.

Organization and Procedure.—SCAP headquarters in Tokyo consisted of 4 general and 18 special staff sections responsible to the supreme commander (General of the Army Douglas MacArthur from 1945 to April 11, 1951; Gen. Matthew B. Ridgway thereafter). The chiefs of nearly all of the sections were United States Army officers, but most of the personnel were American civilians. The division of functions among SCAP sections roughly paralleled that within the Japanese cabinet. Subject to SCAP approval, the staff sections issued orders to the central Japanese government in Tokyo. During seven years of occupation more than 2,200 written directives and 7,500 written administrative orders were issued, but after 1947 most instructions were oral. In general, the occupation worked through the cabinet, and with few exceptions it avoided direct contact with the Diet and the judiciary. Many SCAP directives necessitated new or revised laws or executive ordinances. It was the cabinet's responsibility to issue such ordinances or to have the Diet enact suitable laws.

The occupying forces, consisting chiefly of the United States Eighth Army and the subordinate British Commonwealth forces, had little to do with governing Japan. Their function was to defend the country from attack and, on rare occasions, to maintain domestic order when the Japanese police could not do so. Until late 1949, however, the Eighth Army included 45 prefectural teams of civil affairs officials who supervised prefectural and municipal governments in the local implementation of laws and orders received from the national Japanese government in Tokyo. They were hampered by a lack of authority to issue formal orders to their Japanese counterparts or to communicate directly with SCAP staff sections. In 1949 these teams were disbanded, and their functions were taken over by eight regional teams reporting to SCAP headquarters. The advantages of this administrative simplification were offset by a sharp reduction in personnel, and in any case the change was too late to have much effect on policy. Particularly after the Korean War began in June 1950, occupation supervision of programs other than economic stabilization was relaxed.

Role of Japan.—The character of the Japanese response had much to do with the course of occupation policy. Events disproved some basic assumptions of both hard and soft factions. SCAP orders met a fair amount of resistance and evasion within the Japanese government, but the reaction of the people in general was unexpectedly docile and cooperative. This development led SCAP not only to de-emphasize punitive policies rather early in the occupation, but also to extend reforms into fields not contemplated originally. On the other hand, Japanese cooperation was largely passive, and democratic initiative developed slowly and haltingly. As a result, the SCAP staff assumed the principal role in planning major reforms. Military defeat had discredited the old order and had made Japan ripe for social, economic, and political change, but receptivity to change did not ensure genuine understanding or assimilation of the ideas underlying SCAP policies.

Development of the Occupation.—Though not so planned, the occupation passed through two contrasting phases. From 1945 to early 1948, SCAP was concerned chiefly with retribution and reform, the latter becoming steadily more important. Many programs of this phase continued to the end of the occupation, but from 1948 on they were overshadowed and at times undermined by emphasis on economic rehabilitation.

Demilitarization.—Initially, SCAP's primary mission was to deprive Japan of the capacity to wage war. A new constitution, written by SCAP officials, renounced war and prohibited the maintenance of armed forces. On March 6, 1946, General MacArthur defined this prohibition as applying even to self-defense forces, but he reversed his position on Jan. 1, 1950, and Japan began to rearm six months later. By that time, however, the country had been effectively demilitarized by the following means:

Demobilization.—The Japanese Army and Navy were disbanded. The forces at home were discharged by late 1945, and those overseas were gradually repatriated and demobilized; except for personnel still interned by the USSR, the process was finished by early 1948.

Disarmament.—Weapons, ammunition, and fortifications not needed by SCAP were destroyed. Naval vessels were divided among the United States, the USSR, China, and the Commonwealth. Munitions factories were closed or converted to nonmilitary production, and Japan was forbidden to possess aircraft of any kind.

War Crimes Trials.—Japanese charged with crimes against humanity or with violations of the laws and customs of war were tried by individual Allied powers. At least 6,000 were convicted (the total is unknown because of inadequate reports from the USSR and Communist China, where trials continued as late as 1957). An 11-nation International Military Tribunal for the Far East, meeting in Tokyo, convicted 25 senior Japanese civil and military officials on similar charges and on charges of plotting or waging aggression. All of the trials were designed not only to judge the defendants, but also to produce public abhorrence of their actions.

See also WAR CRIMES.

Purge.—Between January 1946 and May 1948, more than 200,000 Japanese classified as "active exponents of militant nationalism or aggression" were barred from public office and "positions of important responsibility or influence" in industry, finance, commerce, agriculture, press, and radio.

Many others resigned voluntarily or were excluded only from certain offices. Ultranationalist societies were outlawed.

Reparations.—The exaction of reparations was designed as much to curb Japan's war potential as to aid its victims. Japanese overseas assets, valued at \$3 billion or more, were taken over by various Allied powers as compensation for war costs. Japan was also scheduled to transfer capital equipment to nations that had sustained damage from its attacks, but only about \$40 million worth of machinery had been removed by 1949, when the program was discontinued.

See also REPARATIONS.

Democratization.—The destruction of Japan's capacity for war was to be complemented by the elimination of the desire for war. This aim was to be achieved by democratization: a series of political, social, and economic reforms designed to improve the lot of ordinary people and to make the government responsive to popular will, presumably pacifist. Major changes are described in more detail in other sections of this series; the following recapitulation can only suggest their scope and variety.

Civil Liberties.—Censorship was abolished. The notorious "thought control" law (Protection and Surveillance Law for Thought Offenses) of 1936 and many similar laws were abrogated. Secret police organs were dissolved, and political prisoners were freed. State Shinto, the quasi-religious cult of chauvinism that had been a compulsory creed for all Japanese, was disestablished by means of a ban on government support. The new constitution went well beyond the American Bill of Rights in guaranteeing individual freedom.

Family System.—Heads of households lost their legal authority over other adult members of the family. Primogeniture was abolished. Legal emphasis was centered on individual rather than on family rights and responsibilities.

Women's Rights.—Women acquired legal equality with men (specifically, for example, in education, suffrage, marriage, and divorce). They were elected to many political offices, and their organizations acquired greater political and economic influence.

Labor.—SCAP actively encouraged the formation of labor unions, which had been virtually proscribed. Nearly 5 million workers had joined unions by the end of 1946, and a year later the aggregate membership exceeded 6 million. Organized labor soon became a major political force, generally in opposition to the government. Liberal laws on labor relations and labor standards were enacted.

Land Tenure.—Land reform was designed to eliminate absentee ownership of arable land and to reduce tenant farming. Nearly 3 million tenants became farm owners through a program of government purchase and resale of land formerly held by absentee or noncultivating owners and through the imposition of a ceiling on the amount of farmland one family could own. SCAP also encouraged the creation of farmer-controlled cooperatives for purchases, sales, and finance. By 1949 nearly every farm household belonged to at least one cooperative of this kind.

Economic Concentration.—In its first phase the occupation sought to break up excessive concentration of economic power, through which a dozen families were reputed to control 80 percent of the nation's commerce, industry, and finance. Deconcentration or decartelization was intended to

redress the economic balance of power and to give greater protection and opportunity to small- and medium-scale enterprises. Steeply graduated income taxes and inheritance taxes were imposed. Antimonopoly laws were enacted, and *zaibatsu* (economic clique) holding companies and interlocking directorates were dissolved. The operations of other *zaibatsu* companies were restricted by SCAP order.

Class Structure.—By the above-mentioned steps and other means, SCAP did much to make reality approach the ideal, expressed in the new constitution, that all the people were equal. Two privileged classes, the armed forces and the peerage (except the imperial family), were abolished, and legal curbs were placed on a third class, the major industrialists and financiers. Meanwhile, two underprivileged classes, the farmers and the workers, received SCAP's help in improving their position.

Education.—Textbooks were revised to delete ultranationalist dogma, and the special courses in chauvinism known as *shūshin* (ethics) were abolished. Ministry of Education control of the school system was radically curtailed; secondary schools were placed under the supervision of popularly elected local boards of education. The various educational systems were consolidated and reorganized along American lines. Coeducation was expanded, and the period of free compulsory education was increased to nine years. The opening of new colleges and universities was encouraged.

Police.—The highly centralized police force was divided into independent local forces (for municipalities of 5,000 persons or more) and a National Rural Police whose units were controlled by prefectural rather than national authorities. Stringent constitutional limits were imposed on police powers of search, seizure, arrest, detention, and interrogation.

National Government.—The prime minister and the cabinet were made responsible to a Diet (Parliament) elected by universal suffrage. The Supreme Court acquired the power of judicial review of legislative and executive acts and became a coordinate branch of government. The vast powers formerly reserved to the emperor and exercised in his name by a motley oligarchy were divided among the cabinet, Diet, and judiciary, leaving the emperor only ceremonial functions.

Local Government.—The Ministry of Home Affairs, which had controlled local government

as well as the police, was abolished. The offices of governor, mayor, prefectural assemblyman, and municipal assemblyman became popularly elective. The prerogatives of prefectural and municipal governments, and especially of their assemblies, were increased. This general emphasis on local autonomy was, however, offset by financial difficulties created by the transfer of responsibilities formerly supported by national funds. As time passed, the growing dependence of local governments on national aid and subsidies tended to re-establish a measure of centralized control over them.

Rehabilitation.—The Initial Post-Surrender Policy minced no words about rehabilitation: "The plight of Japan is the direct outcome of its own behavior, and the Allies will not undertake the burden of repairing the damage." It was soon evident, however, that without Allied help a crushed Japan could not avert widespread starvation and disease, which might endanger the occupation itself. During the first phase, SCAP therefore augmented Japan's food supply by substantial imports from the United States, and, despite objections from other Pacific nations, revived Japanese fishing and whaling operations outside the immediate Japanese area. SCAP staff sections took the lead in seeking ways to increase food production, and food rationing and price controls were continued. The problems of public health, compounded by the repatriation of more than 6 million Japanese from other parts of Asia, were a major concern, and strenuous efforts were made to improve and expand health services and facilities.

While the United States supplied massive aid to Japan, especially in the form of food, chemicals, and fertilizers, however, the SCAP program of relief and rehabilitation was not intended to solve the problems of the economy as a whole. The initiative in planning economic recovery was left largely to the Japanese, whose efforts, despite repeated prodding by SCAP, were dilatory and thus ineffectual. After two years of peace, inflation was still increasing, industrial production was well below half the 1930-1934 average, and exports were at a dangerously low level. The doctrine that Japan must rebuild its economy by its own efforts and sacrifices had clearly become untenable. Though morally justifiable, it had proved politically and economically unrealistic. Without a viable economy the new social and political structure created by the occupation might be undermined. During 1948, therefore, economic stabilization became the central theme of SCAP policy. A special mission from the United States drafted a strict austerity program "to achieve fiscal, monetary, price and wage stability" and "to maximize production for export." In December of that year, SCAP ordered the Japanese government to put this program into effect immediately. Other missions were sent from the United States in 1949 to supervise the program and to plan a radical revision of the tax structure.

The 1948 change in policy involved more than the assumption by SCAP of economic functions previously left largely to the Japanese. It was accompanied by a belated sense of urgency and a willingness to subordinate nearly all other considerations to the primary one of restoring the economy. Reform programs now had to be justified not so much on philosophical grounds as on their ability to be carried out without harm to recovery. This fundamental change in occupation

attitudes created conflict and confusion within SCAP headquarters as well as among the Japanese. While one SCAP section, for example, exerted pressure on Japanese officials to undertake a massive program of school construction, another was enforcing austerity measures that minimized expenditure for anything but productive investment.

By SCAP initiative or consent many earlier policies were modified or reversed on the ground that they might impede or divert effort from the main goal of economic recovery. In 1948 strikes by government employees were forbidden, not only in the regular civil service, but also in the state-owned railways, postal, telegraph, and telephone services, and salt, tobacco, and camphor monopolies. Reparations removals were ended in May 1949 despite objections by most of the Allied powers in the Pacific area. The economic deconcentration program, long a target for bitter criticism in the United States as well as in Japan, was virtually abandoned. After much argument the Japanese government was allowed in 1950 to start terminating the purge and reinstating persons who had been barred from economic and political positions.

Two external developments ensured continuance of the new policy. The Communist conquest of China in 1949 made it clear that Japan rather than China would have to be the cornerstone and industrial base of any non-Communist or anti-Communist coalition in the Western Pacific. When the Communists invaded South Korea in 1950, the United Nations forces were compelled to rely on Japan not only as their principal forward base of operations, but also as a major source of essential goods and services. The result was an expansion of industry as well as an economic windfall for Japan.

Collateral Changes.—Many of the innumerable changes that took place in Japan during the occupation were due in whole or in part to factors over which SCAP had little or no control. The Japanese have always been remarkably eclectic, and the shock of military defeat caused many of them to regard everything old or native as outmoded and anything new or foreign as desirable. The presence in Japan of hundreds of thousands of Westerners gave the ordinary citizen, even in rural areas, an unprecedented opportunity to observe or learn of a different way of life.

Social processes that had been developing for a generation or more were suddenly accelerated. The steady disintegration of the hierarchic family system was one example; SCAP legal reforms stressing individual liberty and equality intensified a trend long since set in motion by progressive urbanization and industrialization. Similarly, there was a strong movement to compensate for lost time in many important fields of activity. Japanese scientists, educators, and businessmen saw that wartime isolation had caused their country to fall nearly a decade behind other modern powers in methods, instruments, and technology. Their interest in overcoming this handicap was actively encouraged by SCAP staff sections.

Daily life, especially in the cities and in the vicinity of occupation bases, was changed in many ways by the introduction of new (chiefly American) customs and commodities. Western music, food, motion pictures, and books became very popular. Wives took to walking beside their husbands rather than deferentially behind them, and many superficial aspects of Western life were

avidly imitated. On the other hand, the lifting of governmental restrictions on civil liberties caused a vast expansion in the number of serious and scholarly books and magazines being published, and subjects formerly forbidden for political or ideological reasons were now studied and discussed openly. The ideas and ideals not only of democracy but also of various brands of Marxism and socialism gained a wide vogue.

Even language was affected. The already large vocabulary of words borrowed from English was rapidly expanded, often without demonstrable need. Long-frustrated advocates of language simplification or of romanization were encouraged to renew their efforts. The occupation, though sympathetic, decided not to intervene in this field, but the Japanese government sponsored a series of language reforms which, if modest, were by no means negligible.

Achievements.—The shortcomings of the occupation were not hard to see. Many of them could be traced to indecision concerning objectives. For example, it was never clear whether the purge was meant to be punitive (as the Japanese assumed) or preventive (as SCAP insisted). The desire to encourage Japanese initiative came repeatedly into conflict with the need for more rapid or more extensive action. Postulating Japanese initiative did not create it, and efforts to conceal SCAP leadership were ineffectual. Delay in accepting economic rehabilitation as a SCAP mission not only caused recovery to be more difficult and more costly, but made it hard to integrate recovery and reform programs without detriment to the latter. Many Japanese felt that the democratic principles taught in the occupation's first phase were forgotten in the second.

Even in the first phase the Japanese were disturbed to learn that the occupation sometimes seemed not to practice what it preached. Censorship was outlawed, but the occupation imposed its own censorship. Freedom of the press did not extend to criticism of SCAP, however mild or constructive. The purge excluded men from public or private office without a hearing in most cases, and then placed on them the burden of proof in any appeal. Government by decree was anathematized and made unconstitutional; yet SCAP allowed and at times encouraged the cabinet to carry out occupation reforms by executive ordinance rather than permit the Diet to debate them in the form of proposed laws.

Few doubted that SCAP had both the right and the duty to use all necessary means, however peremptory, to transform Japan's oligarchy into democracy. The difficulty was that SCAP seemed to renounce this fundamental premise: first by trying to camouflage SCAP direction with fictitious Japanese initiative, and then by creating a liberal constitution before completing the destruction of antidemocratic institutions. All steps that SCAP considered essential would have been legal under the old constitution. Many of them seemed illegal under the new one, and this fact did not enhance the prestige of SCAP, the cabinet, or the constitution. In this sense, promulgation of the new constitution probably came too soon.

Two other basic weaknesses of the occupation should be mentioned. There was a tendency to equate democratization with Americanization. American experience and solutions were often assumed to be fully and uniquely applicable to the problems of a country radically dissimilar to the United States in resources, traditions, experience,

and psychology. There was also a tendency to underestimate the need for verifying compliance with reform decrees once they had been translated into Japanese law. Poor liaison between SCAP staff sections and prefectural civil affairs teams was a symptom rather than a cause of this weakness.

The achievements of the occupation did not measure up to SCAP's claims, but the claims themselves were immoderate and unrealistic. Neither this imaginary perfection nor the real shortcomings of the occupation are adequate criteria. Measured against history rather than against its own extravagant propaganda, the occupation appears to have been more successful than anyone could reasonably have expected. It did not work miracles. It did not, as SCAP contended, revolutionize Japanese thought "almost overnight"—or in seven years. It made many mistakes and had many failures. But it also produced many solid accomplishments above and beyond the specific reforms mentioned above.

Japan was flooded with unfamiliar ideas, many of which took root, even if only imperfectly. Independent habits of thought won new prestige in a society where individuality was considered unorthodox. The occupation helped to strengthen (perhaps too much) a new-found spirit of pacifism in a nation historically bellicose. It abolished legal inequalities and did much to reduce social and economic inequalities. It gave large segments of the population—farmers, workers, women—at least an opportunity to improve their position. It destroyed most of the apparatus of oligarchic rule that had made democracy impossible, and thus gave the Japanese an opportunity that they had never been able to create for themselves. It restored a devastated economy to a reasonably viable condition. It introduced new methods and concepts into almost every phase of Japanese life without destroying national identity.

These sweeping changes were made, moreover, with a minimum of rancor on either side. They were not, of course, the unilateral achievement of one occupying power, much less of any one man or group. Japanese cooperation was an essential ingredient. While this cooperation was often devoid of real comprehension of SCAP philosophy, it helped the innovations to gain a foothold that proved firmer than many observers had suspected. Postoccupation governments found it expedient to move with remarkable caution in modifying (not to mention reversing) SCAP reforms. There was nothing like the rapid, wholesale repudiation predicted by pessimistic observers. The occupation produced some irritation and some disappointment among the Japanese, but it left a majority of them basically well disposed toward the chief occupying power, even if often critical of its policies. No previous occupation in history could justly claim more.

FOREIGN RELATIONS SINCE 1945

For five years after World War II, Japan was more or less isolated from the rest of the world, though not so strictly as in Tokugawa times. Diplomatic relations were conducted only through SCAP, and little nonessential travel from or to Japan was permitted. Beginning in 1950, controls were gradually relaxed to encourage trade, but the resumption of normal diplomatic relations had to await a treaty of peace. This was concluded in San Francisco on Sept. 8, 1951, and took effect on April 28, 1952.

Peace and Security Treaties.—As a treaty of reconciliation rather than reprisal, the Japanese Peace Treaty imposed lenient terms. The occupation was ended, and full sovereignty was restored. Japan renounced all claims to Korea and to its former island colonies and mandates—Taiwan (Formosa), southern Sakhalin, the Kuril, Marshall, Mariana, and Caroline Islands, and various smaller groups—as well as all special rights in China. The Ryukyu and Bonin Islands were left under United States control without renunciation of Japanese sovereignty. While the right of self-defense was recognized, Japan accepted the obligations in the United Nations Charter for the peaceful settlement of international disputes. Reparations claims were left for bilateral negotiation, but the treaty recognized Japan's incapacity to make complete reparation.

For various reasons, the Communist bloc and some Asian countries were not parties to the San Francisco Treaty, and Japan had to find other means of normalizing relations with them. Peace treaties were signed with Nationalist China and India in 1952, but disputes concerning reparations delayed for several years the restoration of full diplomatic relations with Southeast Asian states. Territorial and repatriation disputes also blocked a proposed peace treaty with the USSR, but diplomatic relations between the two countries were resumed in December 1956. Similar arrangements were made with most other Communist regimes except those in the divided countries (China, Vietnam, Korea, Germany). Relations with South Korea, as well as with North Korea and Communist China, remained acrimonious and unstable.

A security treaty with the United States, effective on the same day as the San Francisco Treaty, authorized the stationing of American land, air, and sea forces in and around Japan until the latter could assume responsibility for its own defense. Thus most occupation forces were not withdrawn in 1952 but merely renamed. Moreover, they retained privileges that led many Japanese to argue that Japan was still not a free agent. Friction developed concerning criminal jurisdiction over Americans charged with offenses against Japanese, the right of the United States to use Japanese bases for military operations outside Japan (for example, in the defense of Taiwan), the acquisition of farmland for airbase expansion, and the introduction of nuclear weapons into Japan. Demands for a stronger Japanese voice in joint defense arrangements led to the conclusion of a new treaty in 1960. The indefinite duration of the 1952 treaty was changed to permit unilateral denunciation after 1970. Although the details were vague, the United States was required by the new treaty to consult Japan on major military movements affecting its Japanese bases. Japanese Communists and Socialists persuaded many of the people that the new treaty made Japan's position worse rather than better. Violent demonstrations and riots by labor and student groups failed to prevent ratification (June 23, 1960), but they caused the fall of the cabinet of Prime Minister Nobusuke Kishi and revealed the fragility of Japan's commitment to the American alliance.

Development of a Foreign Policy.—Such events as the 1960 demonstrations reflected the chronic dilemma of Japanese foreign policy after 1952: whether to remain in the anti-Communist bloc or to follow a neutralist course. Strong forces pulled in each direction. The choice was influenced not primarily by ideology but by Japan's unaccus-

tomed lack of military power, its exposed position close to the two major Communist states, and its extreme dependence on foreign trade.

Japan began rearming in 1950 under American pressure and with American aid, but the pace was slow and the goal unclear. The vastly increased cost of modern weapons systems and the necessity of making a fresh start after total demilitarization made it obvious that military parity with the great powers was no longer possible. Many Japanese felt that rearming on the lesser scale that Japan was able and willing to undertake might be a handicap rather than an asset. Apart from widespread doubts concerning the constitutionality of rearming, there was also general opposition to massive spending for defense, and the government cautiously held military costs to less than 10 percent of the budget.

But the crux of the military dilemma was the proximity of the USSR and Communist China, whose 1950 treaty of alliance was expressly directed against Japan. This was at once the cause of and the chief deterrent to Japanese rearmament. The Socialists argued that the presence of armed forces, whether Japanese or American or both, merely ensured Japan's involvement in any new war. Incessant Soviet and Communist Chinese threats to destroy Japan if war came were resented but were taken very seriously. In the climate of ardent pacifism that dominated Japan after 1945, the Socialist dream of inexpensive safety through disarmed neutrality had a powerful mass appeal.

On the other hand, Japan's economic ties with the anti-Communist West became steadily stronger. Trade with the United States, accounting for approximately one third of Japan's imports and one fourth of its exports, dwarfed that with any other nation, although the fact that the trade balance was usually unfavorable to Japan created many difficulties. In May 1962, Japan joined nine Western industrial nations in creating a buffer fund under the International Monetary Fund to guard against dangerous fluctuations in international exchange. Next to India, Japan was the largest beneficiary of the Western-financed International Bank for Reconstruction and Development, and by 1962 had received 24 long-term loans totaling \$487.9 million for major industrial projects.

Faced with these divergent considerations, successive conservative governments proclaimed Japan's adherence to the anti-Communist alignment but actively sought closer ties with neutrals and better economic relations with Communist states. The result was that Japanese policy often seemed ambivalent. Neutralist states thought it too anti-Communist, while anti-Communist states found it too neutral. Both groups suspected Japan of opportunism.

Japan's indecision was complicated by a kind of ostracism resulting from its past actions. Humiliations dating back half a century made China, Korea, and the USSR vindictive. More recent aggression left a residue of hostility and mistrust in most of the Pacific countries, especially the Philippines and Australia. Great Britain and other nations, including the United States, were apprehensive concerning renewed Japanese competition in world markets.

After 1952, Japan pursued respectability and acceptance through many avenues. Membership in international organizations was avidly sought: Japan joined no less than 25 in the first year after

signing of the San Francisco Treaty and many more later. Admission was often difficult. Soviet vetoes kept Japan out of the United Nations until December 1956, and opposition from the members of the Commonwealth and other countries blocked accession to the General Agreement on Tariffs and Trade (GATT) until September 1955, and thereafter limited application of GATT provisions to trade with Japan. State visits to and from Japan multiplied, and international conferences of all kinds were held in Tokyo. Many international sports meets, including the 1964 Olympic Games, were invited to Japan. Japanese scientists were active in the International Geophysical Year program of 1957–1958. Tourism and international trade fairs were vigorously promoted. These varied activities helped to restore Japanese self-confidence and reduce the feeling of isolation; some of them also helped to improve the country's economic position. Nevertheless, Japanese diplomacy had still to face many difficult problems.

Trade Expansion.—With the loss of its empire, Japan was more than ever dependent on foreign trade. The expansion of trade required good relations with other countries, especially in Asia, where the Greater East Asia Coprosperity Sphere of the early 1940's had proved to be a euphemism for conquest. Major steps in making amends were reparations agreements concluded with Burma (1954), Thailand (1955), the Philippines (1956), Indonesia (1958), and South Vietnam (1959). Though scheduled to cost Japan more than \$1.3 billion in goods, services, loans, and investments over a decade, they were accepted as unavoidable sacrifices. Nevertheless, the recipients were not wholly satisfied. The Philippines alone had originally demanded \$8 billion in reparations, finally settling for one tenth of that sum.

In 1954, Japan joined the Colombo Plan for Cooperative Economic Development in South and Southeast Asia and intensified its efforts to expand trade with this area. Aside from competition by western European industrial powers, the chief difficulty encountered was the weakness of other Asian economies. To develop stronger trading partners, Japan encouraged the movement of private capital into South and Southeast Asia, in addition to investments made under reparations agreements. In 1960–1961 agreements were made to invest in the five-year economic programs of both India and Pakistan, and trade fairs and state visits promoted trade throughout southern Asia. Meanwhile, commercial treaties were concluded with most Asian countries and with many in Europe and Latin America. A major achievement was Great Britain's agreement, in a six-year commercial treaty signed in November 1962, to refrain from applying the GATT escape clause to Japan (that is, to extend to Japan the usual GATT concessions).

Trade with the Communist bloc was affected by political complications. Many Japanese businessmen, ignoring fundamental changes in the mainland Chinese economy after the Communist conquest, had grandiose visions of reviving lucrative trade with China after the Korean War. At the insistence of Japan and most of the other allies of the United States, international restrictions on exports to China were gradually relaxed after 1957. But the Chinese overplayed their hand, injecting into the trade negotiations sweeping political demands: diplomatic recognition, severance of relations with Taiwan, support for seating Peking

in the United Nations, and abandonment of the American alliance. When the Japanese government rejected these demands in 1958, China banned trade with Japan, although a trickle of private trade persisted. Japanese Socialists continued to urge both political and economic rapprochement with China, but businessmen increasingly suspected that the Chinese were much more interested in securing political concessions than in buying Japanese products. Trade relations with the USSR were better, especially under three-year agreements signed in 1960 and 1963. A three-week Soviet trade fair was held in Tokyo in August–September 1961, and the volume of trade, though still relatively small, gradually expanded. Short-term commercial agreements were also concluded with some of the minor Communist states in Europe.

Fishery Disputes.—After the occupation, Japan was involved in disputes with its Pacific neighbors concerning access to traditional fishing grounds. The USSR claimed the right to control fishing everywhere in the Sea of Okhotsk. South Korea forbade Japanese fishing ships to enter a large section of the Japan and Yellow seas adjacent to Korea. Both countries seized Japanese ships, interned the fishermen for long periods, and often kept the ships, alleging a need to prevent Japan from depleting marine resources. Communist China and North Korea followed similar policies on a smaller scale. Fisheries agreements were concluded with the USSR (officially) and with China (privately), but the terms were unfavorable to Japan. The USSR insisted on annual renegotiation and imposed steadily more onerous restrictions on the Japanese. American efforts to mediate the bitter dispute with South Korea were unsuccessful, but a controversy with Australia over fishing and pearling in the Arafura Sea was settled amicably in 1954, and in 1961 Australia agreed to a three-year pact, replacing annual negotiations.

Japanese anger over American and British nuclear tests was aggravated by interference with fishing operations. The most serious incident was the radioactive dusting of a Japanese tuna boat 80 miles off Bikini on March 1, 1954; 23 crewmen were hospitalized for more than a year and 1 died, causing much animosity in Japan toward the United States, although the tests had been announced in advance. While not directly affecting fishing, Soviet and French nuclear tests also drew prompt and vigorous Japanese protests. Nuclear testing was the only important issue on which Japanese Socialists criticized the USSR.

Repatriation.—Communist refusal either to repatriate or to account for approximately 300,000 of the Japanese soldiers and civilians seized at the end of World War II in Manchuria, Korea, the Kurils, and Sakhalin caused much resentment, chiefly against the USSR. After long negotiations, small-scale repatriation was begun by Communist China and the USSR in 1953 and by North Korea in 1955. It continued until August 1957, 12 years after the war had ended and nearly 9 years after the completion of repatriation from non-Communist areas.

Two other groups presented repatriation problems. The internment of Japanese fishermen by other countries was a continuing harassment. Conversely, the repatriation in 1959–1962 of 80,000 Koreans to North Korea caused new friction between Japan and South Korea and left unresolved the chronic dispute over the treatment and status

Japan's chemical fertilizer factories, such as the one shown here, are among the important enterprises that contribute products both for domestic use and for the export trade.

Pictorial Parade

of the approximately 575,000 other Koreans who remained (and evidently preferred to remain) in Japan.

Territorial Issues.—At least in public, Japanese irredentism was confined to efforts to recover small nearby islands. Aside from a trivial but heated dispute with South Korea over Take-shima (Liancourt Rocks), a small, uninhabited island used by transient fishermen, the chief territorial issues concerned the Kuril, Ryukyu, and Bonin Islands. All had been Japanese from the 1870's (well before the first war of conquest) until 1945. The San Francisco Treaty left the Ryukyus and the Bonins under United States rule "pending the making" of a proposal to the United Nations for American trusteeship. The treaty obligated Japan to concur in any such proposal, but the United States continued to recognize Japan's residual sovereignty over the islands. On Dec. 24, 1953, however, the United States returned to Japan the Amami-gunto lying between Kyushu and the main Ryukyu Islands. This action, and the probability that the USSR would veto any proposal for United States trusteeship over the remaining islands, intensified Japanese (and Ryukyuan) agitation for the return of all of them to Japan. Having built Okinawa, the largest of the islands, into the principal defense bastion in the Western Pacific, the United States declined to relinquish control until international tension eased. Japan proposed a compromise whereby civil administration would be turned over to it, while the United States retained the military bases. Faced with mounting difficulties under a similar arrangement in Japan itself, the United States rejected the proposal, but in 1962 it granted greater autonomy to the Ryukyuan government and reaffirmed its recognition that the islands were "a part of the Japanese homeland." Although the Bonin Islands remained closed to Japanese, the United States agreed in 1961 to compensate former residents evacuated during the war and barred from returning to their homes. Japanese dissatisfaction was somewhat alleviated by these and other steps (such as flying the Japanese flag in the Ryukyus on Japanese holidays), but the status of the two island groups remained a source of considerable friction with the United States.

Demands for the return of the Soviet-occupied Kuril Islands were even less successful; they were, in fact, the chief cause of the failure of the negotiations for a peace treaty in 1955-1956. According to numerous public opinion polls, a majority of the Japanese felt that Japan had a right to recover not only the Kurils, but also southern Sakhalin (taken from Russia in 1905),

and preferred to do without a Soviet treaty rather than abandon these claims. In the face of Soviet obduracy, the Japanese government offered to forgo southern Sakhalin and the northern half of the Kuril chain. The USSR would offer only the Habomai Islands and Shikotan Island, and these only if Japan formally recognized Soviet title to all the rest. Japan refused these terms, and argued that these southern islands were not part of the Kurils, but had always been Japanese. Diplomatic relations between Japan and the USSR were restored in 1956 without a resolution of the territorial issue. In 1961 the USSR announced that it would keep the Habomai Islands and Shikotan until Japan abrogated its alliance with the United States and accepted Soviet terms for a peace treaty.

Japan's International Position.—The intense desire of Japan to pursue an independent foreign policy after 1952 proved hard to achieve. Relations with its nearest neighbors remained uneasy. The USSR and China alternately threatened and cajoled a Japan torn between fear that alliance with the United States might provoke a Communist attack, and fear that lack of an alliance would lead to absorption as a Communist satellite. Repeated efforts to negotiate a settlement of bitter disputes with South Korea (chiefly over property claims and fishing rights) were unsuccessful, although relations improved noticeably after the ouster of President Syngman Rhee in April 1960.

Because of the weakness of South and Southeast Asian economies and the pressure of European competition, economic diplomacy produced no startling improvement in Japan's role in this area. There was, however, a marked improvement in the country's commercial reputation throughout the world, and economic ties, much more than military alliance or ideological conviction, bound Japan tentatively to the anti-Communist coalition. Election to the United Nations Security Council for the 1958-1959 term gratified national pride, but many Japanese found it difficult to accept their country's greatly reduced role in world affairs. In February 1961, the Japanese ambassador to the United Nations advocated the sending of Japanese contingents to the United Nations forces in the Congo and the Middle East in order to strengthen Japan's voice in the world body. This proposal was hastily repudiated by his government, which was acutely aware of the strong public opposition to the dispatch of Japanese troops abroad. Yet, as one of the most populous and energetic nations in the world, Japan hoped to achieve a new role of leadership in Asia.

Relatively rapid economic recovery after World War II showed that the Japanese still possessed the will, energy, skills, and resourcefulness that had made them Asia's first industrialized nation. This suggested that Japanese experience might be at least partially applicable to some of the problems facing other Asian countries. Japan perhaps tended to underestimate the difficulties involved in translating this potential connection into either economic or political leadership. Both India and Communist China now also aspired to Asian leadership, and Chinese policy in particular seemed certain to exert a strong influence on political and economic developments in Asia. More than prestige and national pride were involved in the competition; Japan found that it had a vital economic stake in improving relations with other countries, especially in Asia. The rise of Communist China and Japan's shift from militarist to pacifist policies clearly marked the end of an era in the continent, but the Japanese remained cautiously optimistic about their ability to cope with the new situation.

Bibliography.—There is no adequate history of the occupation; existing books are either too narrow in scope or too biased for or against occupation policies. Well-known works include Edwin M. Martin, *The Allied Occupation of Japan* (New York 1948); William M. Ball, *Japan: Enemy or Ally?*, rev. and enl. ed. (New York 1949); Robert A. Fearey, *The Occupation of Japan; Second Phase: 1948-50* (New York 1950); SCAP Government Section, *Political Reorientation of Japan* (Washington 1950); Robert B. Textor, *Failure in Japan* (New York 1951); Evert Joost Lewe van Aard, *Japan: from Surrender to Peace* (New York 1954); and Harry E. Wildes, *Typhoon in Tokyo* (New York 1954). The numerous publications of SCAP staff sections, especially the Civil Information and Education Section, Economic and Scientific Section, Natural Resources Section, and Public Health and Welfare Section, contain much useful data. A well-informed description of Japanese reaction is Kazuo Kawai, *Japan's American Interlude* (Chicago 1960). For recent and current foreign relations, consult two English-language quarterlies published in Tokyo, *Contemporary Japan and Japan Quarterly*, both of which are widely distributed in the United States. Two excellent general works are Hugh Borton and others, *Japan Between East and West* (New York 1957); and Edwin O. Reischauer, *The United States and Japan*, rev. ed. (Cambridge, Mass., 1957).

ROBERT M. SPAULDING, JR.,
Formerly Special Assistant to the Chief of Staff,
United States Forces, Japan.

NOTE: The foregoing 23 articles on Japan were prepared under the joint direction of the editors of THE ENCYCLOPEDIA AMERICANA and Dr. Hugh Borton, professor of Japanese and director of the East Asian Institute, Columbia University, and later president of Haverford College.

JAPAN, Sea of, a basin of the Pacific Ocean, situated between the Japanese islands and the continent of Asia. With a maximum width of approximately 650 miles and a maximum length of 1,000 miles, it has an area of almost 400,000 square miles. Depths of 14,000 feet occur north-east of the Noto Peninsula and east of Okushirishima. During the ice age, when the ocean level was lower, the Japanese islands were connected to the continent by dry land, and the sea was restricted to a much smaller freshwater lake.

The Tsushima Current, a branch of the warm Kuroshio (Japan Current), enters the sea through the Tsushima and Korea straits and follows the coast of Honshu northward. Some water from the Tsushima Current eventually finds its way back into the Pacific through the Tsugaru and La Pérouse (Soya) straits. The Sea of Japan coast

of Honshu is warmed by the current, but heavy snows result when winter air masses from the continent are warmed before they strike the coast. The cold Liman Current flows southward along the continent and chills its coast. Drift ice is carried by the Liman Current from January to April.

The principal ports on the Sea of Japan are Vladivostok and Sovetskaya Gavan in the USSR; Otaru, Niigata, Maizuru, and Tsuruga in Japan; and Hungnam, Chongjin, Najin, and Wonsan in Korea. Because of overfishing, the importance of the sea's fisheries has declined.

C. A. MANCHESTER, JR.

JAPAN CLOVER or JAPANESE CLOVER or HOOPKOOP, one of the bush clovers (*Lespedeza striata*) in the pea or bean family, Leguminosae. Native to China and Japan, it was introduced into the southern United States before the middle of the 19th century. Its range now extends from New Jersey westward to Indiana and south to Florida and Texas. The plant is a spreading annual, growing to a height of a foot or more, with small trifoliate leaves less than an inch long and with rather inconspicuous, pink to purplish or white, beanlike flowers about a quarter of an inch in length. The flowers are developed singly or in small clusters in the axils of the leaves, and some of them are without petals. The fruit is a minute, one-seeded pod.

Japan clover has spread extensively in the United States. It is undemanding, grows readily in relatively poor and dry soil, and serves as a pasture plant, as hay, and as green manure. It is closely related to the Korean lespedeza (*L. stipulacea*), which has also been introduced into the United States and has spread widely.

EDWIN B. MATZKE.

JAPAN CURRENT. See JAPAN, SEA OF; KUROSHIO or JAPAN CURRENT.

JAPANESE AIR PLANT or JAPANESE AIR FERN, a marine exoskeleton widely sold for decorative purposes. Despite its name, it is not an air plant (epiphyte), but the dried, prepared, and dyed exoskeleton of a colonial marine animal (*Thuriaria cypressina*) belonging to the phylum Coelenterata (hydroids, hydromedusae, jellyfishes, sea anemones, corals). This animal is also known as sea cypress or, in the British trade, as sea moss. It is common along both shores of the North Atlantic Ocean and is regularly harvested in the Thames Estuary. A related species, *T. argentea* or squirrel's tail, is found in the eastern Pacific Ocean from Alaska to San Francisco Bay. Its silvery colonies are often washed ashore by storms. The plantlike colonies, 12 inches or more in length, are attached to rocks with a rootlike base and are profusely branched, the branches bearing hundreds of minute hydranths (feeding polyps) and occasionally larger reproductive polyps (gonangia). The stems (hydrocauli) are made up of the transparent, chitinous perisarc and the internal hollow coenosarc through which digested food passes from polyp to polyp.

THEODOR JUST.

JAPANESE BEETLE, an insect (*Popillia japonica*) accidentally introduced into New Jersey from Japan, probably in the larval form in soil around nursery stock. First found in 1916 near Riverton, it is now widely distributed along the

Atlantic seaboard from Massachusetts to South Carolina and west at scattered points through much of the Midwest.

The adult beetle is shiny brown and green with 12 white spots along the sides. It is about $\frac{1}{2}$ inch long and about $\frac{1}{4}$ inch wide. There is a single generation each year. Most of this time is spent by the insect in the soil as egg, larva, and pupa. The female lays a total of from 40 to 60 eggs beginning a few days after the adults emerge from the pupae in the soil about the middle of June. These eggs are laid a few at a time at a depth of from 2 to 4 inches.

The small white grubs live in the ground feeding upon plant roots, often causing serious damage to turf in lawns, parks, pastures, golf courses, and other turf areas. In the winter they go down to a depth of from 4 to 8 inches for protection from the cold.

The adults feed upon and do much damage to 275 different plants at the last count, including most of the economic crops. They show much preference for grape, raspberry, rose (foliage, buds, and flowers), Virginia creeper, dahlia, hollyhock, marshmallow, zinnia, clover, corn, soybean, apple, peach fruit, cherry, elm, horsechestnut, linden, Lombardy poplar, Norwegian maple, and willow. It is estimated that altogether \$10 million damage is done yearly by both larva and adult to farm and orchard crops, lawns, golf courses, and to ornamental plantings.

Control measures against the adult consist of protecting the foliage with sprays made from 50 per cent wettable DDT powder, lead arsenate, or powdered derris. Lawns are protected from injury by the larvae for at least six years with one application of DDT, for three years with one application of chlordane, and indefinitely with one application of milky spore disease dust. The latter, however, usually takes two or more years to become fully effective.

Associate Curator of Insects, The Smithsonian Institution.

JAPANESE CERAMICS. The skill of the Japanese as ceramicists has been known to the Occidental world since shortly after 1542 when a Portuguese ship went ashore at Tanegashima, the southernmost point of the Nippon "home islands." This accidental landing brought the first Europeans to Japan. Fairly soon thereafter, Western trading ships began calling at Nagasaki and taking back to Europe various Japanese products, including ceramics. Portugal was the first, with Spain and the Netherlands close seconds. For nearly 80 years, under the earlier Tokugawa shoguns, all were welcome. During this period strife developed among these Western foreigners which resulted in the Spaniards being expelled in 1624, and the Portuguese in 1638. The Dutch were permitted to stay but were obliged to trade under the most restricted conditions. They were allowed one trading post or factory which was located on Deshima, a small island in the harbor of Nagasaki. Further, the number of trading vessels was rigidly limited. But though the conditions were humiliating, and the men stationed there were virtual prisoners, the Dutch found this trading monopoly very profitable.

The situation continued for over 200 years, or until Commodore Perry's visit in 1853 reopened Japan to foreign trade. During these two cen-

turies of self-imposed isolation, a considerable amount of Japanese ceramics arrived in Europe through the medium of the single Dutch trading post where these wares had a marked influence on Occidental potteries and porcelains. In Holland, examples in underglaze blue were copied by the potters of Delft. At the Meissen porcelain factory the finely decorated pieces done by Kakiyemon were studied and carefully copied, resulting in the Kakiyemon decorations for which Meissen was famous. These in turn were copied by contemporary French factories as well as by Chelsea and various other English porcelain producers.

Another Japanese porcelain, made solely for export, was of great influence, especially on Worcester and Derby china. Known as the Imari or Japanese pattern, many handsome dinner services were produced by both factories during the late 18th and early 19th centuries. This Japanese Imari porcelain was also the inspiration for the Staffordshire "gaudy Dutch." But though their ceramics and the artistry with which they were decorated had a powerful impact on European porcelains and earthenwares, practically nothing was known about how or where they were made until the Paris Exhibition of 1867. At this, the Japanese display included fine examples of antique earthenwares and porcelains. They attracted attention and since then have been studied extensively. As the result, it is now known that there were potteries making earthenware in at least 24 provinces and that the production of porcelains was carried on in some 6 different provinces. Not any of these, previous to the industrialization of Japan in the second half of the 19th century, were extensive establishments, like that at Ching-te-Chen (Fowliang since 1931) in China. They were small ventures, built around the accomplishments of some master of the potting arts or some gifted amateur and made possible by the patronage of an important feudal lord.

In some instances, like the pottery at Seto in the old Province of Owari, the venture was continued by gifted descendants of the founder for generations and each one was known by the same name, as Toshire I, Toshire II, Toshire III, etc. In others, as happened at the Karatsu pottery in Hizen Province, the nucleus might consist of a group of Korean potters brought back to Japan by officers in the army of the great conqueror Toyotomi Hideyoshi (1536-1598).

As far as the Japanese were concerned, porcelains ranked a poor second to the finest of their earthenwares as works of art. As with the Imari, their porcelains were often made for export and shaping and decoration were studied attempts to approximate what Japanese potters and decorators thought were the European tastes. In fact, after the Western industrialization of Japan was firmly established and large ceramic factories were built in the larger cities, such as Kobe, Tokyo, and Osaka, quantities of earthenwares and porcelains were produced in the Japanese manner but adapted for foreign trade.

Although the Japanese are considered by many Occidentals as one of the most gifted pottery-making people in the world, their actual accomplishments in that art were all based on borrowings from, and copying of, the achievements of Asiatic mainland neighbors, the Chinese and Koreans. Further, the special provenance or origin of a given piece of Japanese earthenware

or porcelain is by no means easy to determine. From about 1250 on and especially during the 18th and 19th centuries, the various Japanese potteries continuously copied each others' wares and decorative designs. In addition, some of the highly regarded wares of previous generations were reproduced at other places and so cleverly done that today experts are sometimes at a loss as to whether a specific example was made at the place where it originated or is a later revival, made elsewhere by a master potter who was an admirer of the older ware.

Then too, with the introduction of porcelain making about 1650, some of the better-known potteries produced both earthenware and the newer porcelain. Those in or near Kyoto, especially, made stonewares and porcelains in considerable variation. A large proportion of collectible antique wares were marked but the copying habit was present even here. Not only were the marks of potteries and master potters copied by others but even some of the master potters at times marked their pieces with Ming and other established Chinese marks. Therefore a Japanese ceramic mark is not always reliable proof of origin. Also, the identities of some of the best Japanese ceramic craftsmen are obscured because of their custom of using either their family name or totally different art names. An example is the Taizan family, long active in potting at Kyoto. Beginning about 1680, they used the art name of *Yohei* and later, during the 18th century, changed to *Baiki*. Finally, not all of the wares were always decorated at the pottery where they were made. Some were sent as blanks to such cities as Tokyo where there were large decorating shops, similar to those of Canton where so much of the Chinese porcelains intended for exportation was decorated.

Unlike the Chinese, the Japanese were not established workers in ceramics before the start of their recorded history. Nevertheless, there are evidences that some Nipponese pottery was made as early as the 1st century B.C. and continued for some five or six centuries. These earliest examples were small unglazed figures of horses, boats, men in armor and the like. Their discovery occurred in the course of excavating grave sites that antedate 700 A.D. These rude and crude burial pieces are considered by experts to show strong Chinese or Siberian influences. They are the first indication that the art of pottery making reached Japan from the Asiatic mainland and was not indigenous to the home islands of Honshu, Shikoku, Kyushu, and Hokkaido.

After 700 A.D., broadly taken as the beginning of recorded pottery making in Japan, some useful earthenware pieces were made in Nippon potteries located here and there. Judging from the limited number of examples still extant, these closely resembled Chinese pottery of the T'ang period and undoubtedly at first were the work of Chinese craftsmen. During the 8th and 9th centuries, there were sizeable migrations from China to Japan of potters as well as Buddhist priests. During this two-century span the Japanese liberally adopted Chinese culture, customs and literature. As a result, the earthenware with mottled glaze then made in Japan closely resembled, if it did not copy, that made in China.

Following this, there were no outstanding developments in Japanese pottery throughout the Early Heian (784-897) and the Late Heian (897-1184) periods save that the Nipponese potters

made their wares with a marked ornateness and elaboration and began to use some gilding. Buddhist religious figures with multiple pairs of arms and ornate decoration characterized Japanese pottery and native artistic restraint so apparent in later ceramics was completely lacking.

With the Kamakura period, which lasted for close to two centuries (1185-1333), the culture of the Sung dynasty that ruled China from 960 to 1279 A.D. became manifest in Japanese ceramics and continued to make its influence felt for close to another century. This was the time of Kato Shirazamon, first outstanding native potter. About 1223 a priest named Dogen is believed to have taken him to China to study the work of potters of the Sung period, then more popular in Japan than they were at home. In time this student potter returned, became known as Toshiro I and began to put in practice what he had learned. He established a pottery in Owari Province. Here, working with a purplish clay brought from China, he produced thin walled pieces that were turned on a wheel and finished first with an even brown glaze and then so covered by a black glossy one as to show streaks and spots. Later, Toshiro I had a pottery at Seto in the same province where he used native gray clay and finished the pieces with a reddish-brown underglaze and a brilliant black overglaze.

Such pieces are called Old Seto. The town itself was the first important pottery center. Here flourished his successors, Toshiro II and Toshiro III, who made the Old Seto ware, chiefly known from later pieces similar to it. They were followed by other masters who worked in Seto and nearby towns until the end of the 19th century. One of the towns was Nagoya, best-known for the work of the 19th century potter Oki Toyosuke. He originated an earthenware with a white opaque crackled glaze decorated with green spots.

Toward the close of this period or early in the Ashikaga (1338-1573) the tea ceremony became an established part of Japanese life. This too was of Chinese origin as the ancient tea testing competition in which individual tea bowls were wagered as to which dried first or remained moist longest after the tea in them had been drunk simultaneously by the owners. The Japanese changed this wagering contest into a formal ceremony, governed by strict rules of behavior, which is still a vital part of their social life. The host generally does not invite more than four guests. The ceremony is conducted in a small room about nine feet square, entered not from the house but from the garden. The door is so low that one enters on hands and knees. The tea ceremony equipment is always austere simple for the idea is to show the best of taste by using inexpensive materials. The individual parts may be of great age. All follow the designs established before the 16th century. Aside from the iron kettle in which the tea water is boiled, the iron chopsticks for handling the charcoal and the bamboo dipper for the hot water, the pieces are of stoneware. They consist of the brazier or *hure* over which the water is heated, a small jar for the powdered green tea, called a *chawe*, an incense box or *kogo*, a tray or *sara*, a water jar or *takatori*, and tea bowls, called *chawan*. The host serves each guest separately. A small amount of the powdered tea is put directly into the tea bowl and hot water added. The contents are then stirred with a

bamboo splint until it froths and the guest drinks his bowl of tea in three and a half sips, sucking it audibly to show keen enjoyment as well as showing the proper expression of delight. Throughout the ceremony, the water in the kettle is kept simmering to give the illusion of wind blowing through pine trees. There are no decorative accessories in the room other than a small tea screen, painted with a stylized landscape, and a few flowers arranged in a vase or single art object. The flower arrangement is placed on a little platform or *takanoma*, standing about six inches from the floor. Tea ceremony flower arrangements are designed to be used only once and young Japanese women spend a major part of their lives learning how to do them.

During the Momoyama period (1574-1602) came the Korean potters. Under the conquering general Hideyoshi, who rose from a humble groom to be Japan's military hero, Korea was subjugated and on their return a number of his generals brought with them trained Korean potters. These were settled under their patronage in various of the leading pottery towns. Here they soon introduced pottery shapes and wares that had been made for many years in their native land. Karatsu in Hizen Province was one of the important places where these Koreans were located. At first their pieces were probably pure Korean, including the *mishima* or inlaid type which the Japanese named *Oku-Korai* or Old Korean. Later, at the same place, these captive potters or their descendants developed several special wares known as *Chosen Karatsu*. One was made of blue-black clay and had a glaze resembling cast iron. Another with a green, black or brown glaze was streaked with an overglaze of olive green or white. There was also the painted Karatsu where the glaze was swiftly and crudely touched with strokes of brown or black overglaze.

Finally, there was a finer but similar ware produced for the princes of Hizen as presentation pieces. It was made of a fine yellow or brown clay, finished with a transparent crackle glaze combined with *mishima* inlay and called *Kenjo-Karatsu*. Other Korean potters were settled in Chikuzen Province. They made tea ceremony stoneware pieces with a dull brown, yellow or black spotted glaze and another ware having a golden brown glaze that was largely used for making ceremony tea jars. Still other Korean potters worked at Kyoto. One of them, Ameya, had a son named Chojiro who before his death, about 1610, was presented with a golden seal by the conqueror Hideyoshi. It was cut with the character *raku* meaning contentment. Chojiro developed his *raku* ware of a coarse, lightly fired clay shaped by hand into thick-walled bowls with carved or scraped surfaces. This ware was first glazed in black, then red or green and, finally, a straw yellow or even white. It was especially used for making tea bowls since it did not transmit heat readily. Many copies have been and still are being made of the *raku* ware. Members of the family are reported to be even now making it and marking it with the same presentation seal.

Satsuma, best-known of all the earthenwares, was also originated by a Korean working in Japan. The Prince of Satsuma (Saigo Takamori) was the patron of the pottery of the same name, located on the Island of Kyushu where Koreans had worked from sometime in the 15th

century. Toward the end of the 16th century, the then ruling Prince of Satsuma induced 17 more Koreans to come to work in his pottery. They soon scattered but not before one of them named Boku Heii discovered nearby deposits of a fine white clay. From it he made a finely crackled cream ware. Then, working with another potter, named Kanyu, from about 1640, the first white Satsuma resulted. It was a fine ware without decoration but covered with an ivory colored, very finely crackled glaze.

Most of this new ware was made at the nearby pottery at Tadeno in the same province and was also controlled by the prince whose name the ware has borne ever since. As these Korean workers left the Satsuma pottery, they took with them knowledge of how to make this special ware and in time it was produced in a number of different potteries, such as Chosa, Awata, and Ota. Old Satsuma stands foremost and surpassed all the other earthenwares. The pieces are small and the modeling fine. The color ranges from cream to old ivory but the glaze always has a very fine crackle. Later some of the pieces were decorated with raised ornaments and overglaze enamel colors. Brocaded Satsuma, so-called because the decoration simulates the design of a fine piece of silk brocade, was first made at the pottery in Chosa.

Other variations of Satsuma had the same crackled glaze but occurred in such colors as apple-green, straw-yellow, a pure black and sometimes black dusted with gold. In the 19th century, especially the latter half, examples of Satsuma or imitations of it were made for export. Artistically they rank very low since such ornaments as dragons, peacocks, the phoenix and human figures were added. These examples were largely produced in factories located chiefly in Osaka, Tokyo, and Kobe.

Besides the Korean craftsmen, there were a number of outstanding potters of native Japanese stock during the 17th century. The two who are best-known worked in Kyoto. Ogata Kenzan who lived from 1663 to 1743 was a potter, a poet, painter and master of the Tea Ceremony. He decorated his wares with flowers, landscapes, birds, trees and occasionally figures. His decorations were rendered with the fewest possible brush strokes and in a few simple colors. He was constantly varying his style and had many followers. The Japanese have always revered his work. Today there are collectors of Kenzan examples in all parts of the world though some of their pieces are "in the style of Kenzan" rather than genuine examples. The other great ceramic artist was Ninsei who worked about ten years some time before 1640. An artist and amateur potter, it is said that he could make any type of pottery though he is best known for his yellow or gray crackle glazed pieces with a circular mesh on which he painted flowers or ornamental patterns in red, silver, gold and other enamel colors, always simply done. Some pieces bearing his mark are still extant and are among the most costly of all Japanese ceramics.

In the 18th century the artistic quality of Japanese earthenwares began to deteriorate. Possibly this was because the best artists were modeling and decorating porcelains and those of artisan grade concerned themselves chiefly with making copies of the work of earlier masters. Consequently many 18th century earthenware pieces and most of those produced in the 19th

century fall far short of the artistic standards that had prevailed earlier and are generally ignored by well-informed collectors and museum curators.

JAPANESE PORCELAINS

Porcelains were not made in Japan until the beginning of the 16th century. The first Japanese potter to work in this ware was Gōrodayu go Shonzui who lived in Hizen Province. It is stated that he went to China and worked for five years in the potteries at Ching-te-Chen. Having learned all he could he returned home, bringing with him specimens of Chinese blue and white porcelain and a supply of the necessary kaolin and petuntse. On reaching home he produced a limited quantity of porcelain which closely resembled the Chinese but when his supplies were exhausted he had to stop work. Nothing further was accomplished until the opening years of the 17th century when a Korean potter named Risampeï who was settled in Hizen Province discovered deposits of kaolin and petuntse near Arita, another potting center in the same province.

Porcelain kilns were then established about 1610. First located at Hyakken, they were later moved to Arita to be near the source of supplies. It is believed that a limited amount of blue and white porcelain was made here but not until nearly 40 years later was porcelain making undertaken seriously, as the result of the initiative of Kakiyemon, great Japanese maker and decorator of porcelain mentioned earlier, and his companion Tokumon. They intended to go to China to learn the secrets of enamel colors but in Nagasaki the captain of a Chinese junk gave them the information and they returned to Arita. Kakiyemon soon perfected the beautiful type of decorating that is still known by his name and his porcelains not only became well-known in Japan but were used as models at Meissen and other European factories.

After this success at Arita other works were established at Nabeshima and Mikawachi, also in Hizen Province, which were under the control of such powerful feudal lords as the Prince of Nabeshima. At all three places a sizeable amount of fine porcelains were produced in a comparatively short time. Other porcelain factories sprang up in the provinces of Kyoto, Owari, and Kaga. They all tried to duplicate the porcelains of Hizen Province. Prince Maeda who controlled the pottery at Enuma in Kaga Province sent one of his master workmen, Goto Saijirō, to Arita to learn their secrets of porcelain making and decorating. He came back with the desired information and porcelains were made at Enuma from the latter part of the 17th century until about 1750. These are now called Kutani.

Early Japanese porcelains varied somewhat in the quality of body and glaze but modeling was always done with restraint and decorations were either delicately drawn designs done underglaze in blue or with overglaze enamels handled in excellent good taste. Since the Japanese greatly admired the Chinese celadon wares, these were often used as models for porcelain shapes.

The dominant characteristic of Japanese porcelain was its reticence of coloring and design. The composition of decoration always had high artistic merit and was kept well within bounds. Consequently decorative exuberance was virtually unknown except for the Imari ware which was

made for export. With this the decoration was planned and executed to adhere to the suggestions of Dutch traders. Popularity of Imari pieces when they reached Europe indicates that these traders knew the European taste of the time better than some present-day experts who have little good to say about Imari ware.

In general all Japanese porcelains of the 17th, 18th and early part of the 19th centuries were of a very hard paste. The glaze had a slightly bluish tint and decorations were striking and effective in color and design. Figures and landscapes were seldom used; those often employed were the crane, symbol of prosperity, the tortoise for longevity, the lion for valor and other animals, birds and fish, all were delineated with great simplicity. Flowers and trees were frequently used as decorations carefully posed and executed. In addition to blue used for underglaze decoration, the chief colors of overglaze enamels were a thick opaque Indian red, a light tone of yellow, sometimes with a grayish tinge and a green that tends to have a bluish cast. Another distinguishing mark whereby Japanese antique porcelains can be recognized are the three slightly rough spur marks found on the underside of each piece. These were caused by the spurs or thin rods of clay on which the pieces rested during firing.

Besides the usual porcelain, Japanese factories also produced very thin eggshell porcelain. It was first made at Mikochi in Hizen Province where it was decorated with underglaze blue. It was later made elsewhere and in the 19th century was decorated with figures of women and warriors done usually in gold, red and blue. These figures are sometimes covered by a very fine network.

The artistic quality of porcelains was maintained throughout the 18th and well into the 19th centuries. Among the outstanding artists who decorated porcelains after 1800 were Rokubei, father and son of Kyoto; Zengoro, also of Kyoto, whose reputation rests on his gold brocade and gold pattern on red ground, considered in Japan as among the most precious; Tamikichi of Seto in Owari Province who was backed by the Prince of Owari and had a number of fine decorators working under him. Also there was the important factory at Enuma in Kaga Province which suspended in 1868 but reopened and by 1885 employed some 2,700 workers. Of the well-known factories, that at Arita is reported to have resumed operation under the United States occupation of Japan and is again making fine quality porcelain, more for export than for home consumption.

E., *The Book of Pottery and Porcelain* (New York 1944); Honey, W. B., *Dresden China* (London 1934); Bond, H. L., *An Encyclopedia of Antiques* (Boston 1937).

JAPANNING, the art of giving a brilliant finish to a surface by applying several coats of varnish, dried and hardened so as to be fixed. The article to be japanned is first brushed over with two or three coats of priming. It is then covered with varnish, previously mixed with a pigment of the tint desired. This is called the ground color; and if the subject is to exhibit a design, the objects are painted upon it in colors mixed with varnish, and used in the same manner as for oil-painting. The whole is then covered with additional coats of transparent

varnish, dried or baked on and polished. The process is subject to considerable variations, being a combination of painting and partial enameling. See LACQUERS, INDUSTRIAL; VARNISH.

JAPHETH, jā'fēth, a son of Noah and progenitor of the branch of the human race called Japhetic, born when his father had attained his 500th year (Genesis 5:32). For his act of filial respect to his father (Genesis 9:23-27) he received the latter's blessing and promise of future enlargement, when his descendants would extend over the world, and Canaan to be his as well as Shem's servant. Married before the Flood, he and his wife were saved in the ark. The birth of his seven sons occurred after the Deluge (Genesis 10:1). The name has been variously explained. According to Genesis 9:27, it is derived from an Aramaic root, signifying "to expand," in allusion to the wide expansion of Japheth's descendants in the west of Europe, and the north of Asia, including Armenians, Medes, Greeks, Thracians, and so forth. Others trace it to the root "fair," in reference to the light complexion of his posterity. The former derivation has most in his favor. Arab legend invests Japheth with wondrous powers, and mentions 11 of his sons as founders of as many Asiatic nations. But the gift of imagination was not given to rabbinical and Mohammedan writers alone. Some more modern authors seek to identify Japheth with the Iapetus (q.v.) of Greek fable (Margoliouth, G., in Hastings's *Dictionary of the Bible*), whose wife, Asia, bore Prometheus, civilization's founder. The word, too, has been loosely employed by some philologists in the term Japhetic or Indo-European languages, in contradistinction to Semitic and Hamitic. The homiletical tendencies of the rabbis are exemplified in the Midrashic comment on Genesis 9:1, when God blessed Noah and his sons. In blessing Japheth He promised that all his sons should be white and gave as their portion deserts and fields.

JAPIKS, jā'pīks, **Gijsbert**, Frisian poet: b. Bolsward, 1603; d. 1666. He was carefully educated and became a schoolmaster at Bolsward. He made translations from French verse and also wrote a number of versions of the Psalms. His original verse was exceptionally meritorious and did much to restore the Frisian dialect to its place in literature. His *Friesche Rymlerye* (1668), was edited by Epkema (Leeuwarden 1821; with vocabulary and grammar, 1825).

Consult Halbertsma, Joost and Eeltje, *Hulde aan Gijsbert Japiks* (Bolsward 1824; Leeuwarden 1827).

JARARACA, zhā-rā-rā'kā, venomous South American serpent of the crotaloid family, classified as *Lachesis jararaca*, *Bothrops jararaca*, and also as *Trimeresurus jararaca*, a closely allied species being the labaria, *Trimeresurus atrox*, from which it is almost indistinguishable. The jararaca ranges from the Amazon regions southward to São Paulo and westward to Peru and Ecuador. The color is grayish brown, spotted with darker brown above and gray beneath with longitudinal rows of whitish or yellowish spots. The bite is generally fatal.

JARDIN D'ACCLIMATATION, zhār-dān dā'klē-mā-tā-syon', Paris, a plot of 50 acres in the northwest angle of the Bois de Boulogne devoted to the acclimatization of foreign plants

and animals. It was founded in 1860, and contains more animals, except beasts of prey, than the Jardin des Plantes. It has also a permanent exhibition of the processes and equipment of a dairy, aviary, greenhouses, poultry and carrier pigeon raising and gardening, and there is a winter garden and an aquarium. It forms a popular resort for pleasure and information.

JARDIN DES PLANTES, zhār'dān dā plānt, Paris, a plot of 74 acres originally known as the Jardin du Roi, founded by Gui de La Brosse, physician to Louis XIII in 1635 as a garden for medicinal herbs. After the appointment of Georges Louis Leclerc, comte de Buffon as director, in 1739, the menagerie, galleries of collections, libraries, laboratories and lecture-rooms were established there and since 1794 it has been known as the Museum d'Histoire Naturelle.

JARDIN MABILLE, zhār'dān mā'bēl', Paris, a popular resort of the demimonde founded by a dancer, Mabile, in 1840 and continuing one of the showplaces of the city until its close in 1875. It was celebrated for its beautiful fittings and for its originations in dancing.

JARDINE, jār'din, **William M.**, American agronomist: b. Oneida County, Idaho, Jan. 16, 1879; d. San Antonio, Texas, Jan. 17, 1955. Graduated from Utah State Agricultural College in 1904, he taught agronomy there for two years, and in 1907 was appointed assistant United States cerealist in charge of dry-land grain investigations. In 1910 he accepted a post as agronomist at Kansas State College of Agriculture, where he became dean of agriculture in 1913 and president of the college in 1918.

In 1925, President Calvin Coolidge appointed Jardine secretary of agriculture. He expanded the department by establishing a cooperative marketing division as a research bureau to aid in the organization of cooperative farm projects, and sponsored a program for the development of farmer-owned commodity cooperatives to be governed by a Federal Farm Board. Leaving office with Coolidge in March 1929, he was appointed minister to Egypt by President Herbert C. Hoover in July 1930, remaining until 1933. After a brief period as state treasurer of Kansas, he became president of the Municipal University of Wichita, serving from 1934 to 1949. He was the author of many papers and bulletins in the fields of education, economics, and agriculture, and a fellow of the American Association for the Advancement of Science.

JARNAC, zhār-nāk', France, town in the department of Charente, on the river Charente, 18 miles west of Angoulême. It has a large trade in brandy and wine and manufactures wine casks. It was the scene, March 13, 1569, of the defeat of the Huguenot forces under Louis, Prince of Condé and Gaspard de Coligny by the Catholics under Francois, Duke of Anjou. Pop. (1946) 4,075.

JARNEFELT, yār'nē-fēlt, (**Edvard**) **Armas**, Finnish composer: b. Viborg, Aug. 14, 1869. He studied under Martin Wegelius and Ferruccio Busoni at the Conservatory at Helsingfors, under Jules Massenet at Paris and A. Becker at Berlin. He became conductor of the theater at Magdeburg in 1897, at Düsseldorf

in 1898, and was conductor of the Viborg orchestra from 1898 to 1903. He then conducted opera at Helsingfors (1903–1907) and at Stockholm (1907–1932), becoming court conductor also in Stockholm (1910). He returned to the Helsingfors opera (1932–1936), and led the municipal orchestra there (1942–1943). In addition to orchestral and choral works, instrumental music, and songs, he wrote incidental music for plays and motion pictures.

JARO, hǎ'rô, municipality, Republic of the Philippines, in Leyte Province on Leyte Island. It lies in a mountainous agricultural region 15 miles west of Tacloban. Rice and coconuts are the chief crops. Pop. (1948) 19,650.

JAROSLAW, yǎ-rô'slăf, town, Poland, in Rzeszów Province, on the San River, 16 miles north of Przemyśl. Its chief manufactures are flour, metalware, cement products, lumber, and bricks. Part of Poland in 1382, it passed to Austria in 1772, and was returned to Poland in 1919. Pop. (1946) 19,376.

JARRAH, jǎr'ă, the common name of a tree, *Eucalyptus marginata*, of the myrtle family (Myrtaceae), native to Western Australia. It reaches a height of 50 to 150 feet, and has a subfibrous bark which is persistent up to the small branches. The juvenile leaves are opposite for several pairs, oblong to ovate, and short-petioled, whereas the mature leaves are alternate, petiolate, narrowly to broadly lanceolate and acuminate, usually with thickened margins. The white flowers are in axillary umbels of from four to eight, appearing irregularly from September to February. The red timber of this tree is one of the best for many purposes, being very durable as a structural timber either above or below ground or in water. It is reputedly resistant to attacks by termites, mice, and shipworms, and is widely used for marine pilings.

RICHARD M. STRAW.

JARROW, jǎr'ô, municipal borough, England, in Durham County, on the Tyne, 5 miles east of Newcastle. A shipbuilding center from 1851, it has foundries as well as factories producing machinery, chemicals, electrical equipment, and paper. The parish church, St. Paul's, incorporates parts of a basilica founded in 685, and the Venerable Bede (673–735) spent most of his life in the nearby monastery of Wearmouth and Jarrow. Pop. (1951) 28,635.

JARVES, jǎr'vēs, Deming, American glassmaker: b. Boston, Mass., baptismal date Dec. 9, 1790; d. there, April 15, 1869. In 1817, Jarves and others bought the Crown Glass Company of Cambridge, Mass., renamed it the New England Glass Company, and began the manufacture of flint and crown glass. At that time English glassmakers controlled the American market through their monopoly of secret formulas for making litharge (red lead). Jarves built experimental furnaces and succeeded in compounding litharge, thus enabling American firms to compete with English manufacturers. About 1824 he broke with his partners and opened a factory at Sandwich, Mass., which began making glass on July 4, 1825. The company was incorporated in 1826 as the Boston and Sandwich Glass Company, and made apothecary glassware, table glass, chandeliers, and

lamps. Jarves left that firm in 1858 and established the Cape Cod Glass Company nearby, which came to an end with his death in 1869. He published *Reminiscences of Glass Making* (1854). See also CAPE COD—History.

JARVES, James Jackson, American art collector: b. Boston, Mass., Aug. 20, 1818; d. Tarasp, Switzerland, June 28, 1888. The son of Deming Jarves, he left school at 16 and traveled extensively. In Honolulu in 1840 he founded and edited the weekly *Polynesian*, later the official organ of the Hawaiian government. About 1850 he settled in Florence, Italy, and was one of the first Americans to collect and write about early Italian painting. He placed his collection of 119 paintings in the new art school at Yale University shortly after 1866, and the university bought these at auction in 1871. Most of a later collection of 52 paintings found their way to the Cleveland Museum of Art. He gave his valuable collection of Venetian glass to the Metropolitan Museum of Art, New York City, in memory of his father, and Wellesley College acquired his collection of laces, embroideries, and Renaissance fabrics.

JARVIS, jǎr'vīs, Edward, American physician: b. Concord, Mass., Jan. 9, 1803; d. Dorchester, Oct. 31, 1884. He graduated from Harvard in 1826 and from the Massachusetts Medical College in 1830. He set up practice in Northfield, Mass., later in Concord, Mass., in Louisville, Ky., and from 1843 in Dorchester, where he was particularly successful in treating insanity. His interest in anthropology and vital statistics led him to a close study of the census, and his suggestions for improvements in census procedure were largely adopted. He gave his valuable statistical library, one of the best in the United States, to the American Statistical Association, of which he became president in 1852.

JARVIS, John Wesley, American portrait painter: b. South Shields, England, baptismal date July 1, 1781; d. New York, N.Y., Jan. 14, 1839. His parents emigrated to the United States soon after his birth, leaving him in the care of his uncle John Wesley, the founder of Methodism. When he was five years old he was taken to Philadelphia to join his family. As a schoolboy he worked for the portrait painter Matthew Pratt and other artists, and was later apprenticed to the print publisher Edward Savage, who moved his shop to New York City in 1800. His apprenticeship completed, Jarvis and Joseph Wood opened a studio in New York, painting miniatures and profile portraits on glass. Jarvis soon opened his own studio and was especially successful with portraits painted on Bristol board, as well as with miniatures on ivory and portraits in oil. Thomas Sully was his assistant in 1807, and later (1816–1823) Henry Inman became his apprentice and assistant. With Inman's assistance he completed as many as six portraits a week, painting such notables as Henry Clay, DeWitt Clinton, James Fenimore Cooper, Fitz-Greene Halleck, James Lawrence, Robert Morris, and Thomas Paine. The leading portrait painter of his day in New York, he made a large income, but lived excessively, became a hard drinker, and died in poverty. In the 1830's he painted a series of full-length portraits of the heroes of the War of 1812 for the New York City Hall and a series of portraits

owned by the New York Historical Society.

JARVIS, Thomas Jordan, American statesman: b. Jarvisburg, Currituck County, N.C., Jan. 18, 1836; d. June 17, 1915. He worked his way through Randolph-Macon College, enlisted in the Confederate Army at the outbreak of the Civil War, and, when he was disabled in 1863, had become a captain in the 8th North Carolina Regiment. After the war he studied law, began practice in 1867, and in 1868 was elected to the state legislature. Elected lieutenant governor in 1876, he served as governor upon the resignation of Gov. Zebulon Baird Vance in 1879, and in 1880 was elected to a full term, proving to be an able and courageous executive. From 1885 to 1889 he served as United States minister to Brazil, and in 1894 was appointed to the Senate to fill a vacancy of one year.

JARVIS ISLAND, one of the Line Islands in the Pacific Ocean. It lies just south of the equator, 190 miles southwest of Christmas Island, and has an area of one square mile. Claimed by the United States in 1857, it was worked for guano until 1879, and in 1889 was claimed by Great Britain. In 1935 it was colonized from Hawaii, and in 1936 was placed under the United States Department of the Interior. It lies on the air route from Hawaii to New Zealand and has a weather station and a landing field. For census purposes the island is included with the Territory of Hawaii.

JASHAR, or JASHER, jā'shēr, *Book of*, a lost book of ancient Hebrew national songs, probably both religious and secular. It is mentioned by name twice in the Bible (Joshua 10:13; II Samuel 1:18), where passages from it are quoted in the song of Joshua and in David's lament over Saul and Jonathan. The song of Deborah (Judges 5), Solomon's speech dedicating the Temple (I Kings 8), and possibly some other passages in the Old Testament may also quote from this source. The book was probably not completed before the time of David or of Solomon and the building of the Temple (about 960 B.C.). The etymology of the word *Jashar* (Heb. *Haya-shar*) is uncertain; it may derive from a word meaning "victorious," or from one meaning "song," or one meaning "sing." It has also been translated "upright" on the assumption that it had the same root as *Jeshurun*. Most Jewish commentators accept the Targum "book of the law," on the theory that the events mentioned in the fragments quoted in Joshua and II Samuel constitute a fulfillment of passages in the Pentateuch.

JASMIN, zhās-măn, **Jacques**, pen name of JACQUES BOÉ, French poet: b. Agen, France, March 6, 1798; d. there, Oct. 4, 1864. He was also known as *Jasmin d'Agen* and as the Barber Poet, and was called the last of the troubadours. A wigmaker by trade, he devoted his leisure to reading and study and developed a talent for composing poems and songs in the Gascon dialect surviving from the old *langue d'oc* of southern France. He went from town to town reciting his poems at fairs and carnivals, and gave most of the money he received to charity. People came in crowds to hear him. His first book of poems, *Las papillotas* (*Curl Papers*), was published in 1835 and was followed by three others with the

same title in 1842, 1851, and 1863. Especially popular were his poems *Lou chilibari* (*Le charivari*, 1825), *L'abuglo de Castel-Culie* (*The Blind Girl of Castle Culier*, 1835), and *Françouneto* (1842). When Jasmin visited Paris in 1842, Louis Philippe gave a reception in his honor, and in 1846 he was made a chevalier of the Legion of Honor. The Académie Française crowned his works, and he was honored by Toulouse University and the pope. His works furthered the revival of Provençal literature by the Félibrige (q.v.), although he never regarded himself as one of them.

JASMINE, jās'mīn; jǎz'mīn (also called JASMIN and JESSAMINE), the common name for members of the genus *Jasminum*, comprising about 200 species of erect or twining shrubs in the olive family (Oleaceae), distributed throughout the tropics and subtropics of the world. The opposite or alternate leaves are usually pinnately compound, but are sometimes reduced to a single leaflet. The flowers are generally showy and fragrant, of yellow, white, or reddish colors, mostly disposed in terminal clusters or occasionally solitary. The bell- or funnel-shaped calyx has from four to nine bristly teeth, and the deeply tubular corolla has as many spreading lobes. The two stamens are short and included within the tube. The fruit is a two-lobed berry, usually black, each lobe of which contains one or two seeds.

About 25 species are in cultivation; they are easily cultured, but vary from hardy to hothouse types, and their requirements must be met. The common or poet's jasmine, *J. officinale*, is a deciduous shrub with long, weak stems and fragrant white flowers $\frac{3}{4}$ to 1 inch across, borne in loose clusters. It is native to regions from Iran to China and India. Perfumes are made from its flowers, and a large-flowered form is cultivated extensively in southern France for this purpose. The winter-blooming *J. nudiflorum* is a Chinese species.

Several other plants are also called jasmine. The box jasmines are members of the genus *Phillyrea*, also of the olive family, with three or four species native to the Mediterranean-Black Sea region. The Cape jasmines are members of the genus *Gardenia* of the madder family (Rubiaceae), with some 80 species of evergreen shrubs native to tropical Asia and Africa. *Androsace chamaejasme* of the primrose family (Primulaceae) is called rock jasmine. The Carolina, yellow, or false jasmine, *Gelsemium sempervirens*, is a climbing or trailing vine in the logania family (Loganiaceae) native to the southeastern United States; an antispasmodic drug is derived from its rhizomes.

RICHARD M. STRAW,
Assistant Professor of Botany, Los Angeles State College.

JASON, jā'sūn, Jewish high priest from c. 174 to c. 171 B.C. He was the second son of Simon II and a brother of Onias III, whom he succeeded as high priest through bribery. Flavius Josephus (37-?100 A.D.) says in his *Antiquities of the Jews* that he changed his name from Jesus to Jason. As high priest he set up a gymnasium and ephebeum at Jerusalem in which he introduced "heathenish and foreign" practices, and gained for the people of Jerusalem the title and privileges of citizens of Antioch. He furthered the spread of Greek secular and religious customs, sending to the Olympic games at Tyre a large sum of money for a

sacrifice to Hercules; the money was used, however, for building galleys. He was deposed about 171 B.C., Menelaus succeeding him through bribery. In 170 B.C., while the ruler Antiochus Epiphanes was fighting in Egypt, Jason again seized power, but was expelled when Antiochus returned. He took refuge at Sparta, where he died miserably. His story is told in II Maccabees 4:7-26 and 5:5-10.

JASON, in Greek legend, the son of Aeson, king of Iolcus in Thessaly, a hero of ancient Greece, celebrated for his share in the Argonautic expedition, before which he had distinguished himself in the Calydonian hunt (see CALYDONIAN BOAR). He belonged to the family of the Aeolidae at Iolcus, and his instructor was the centaur Chiron, who educated many heroes of that time. (For his adventures in the Argonautic expedition see ARGONAUTS.) On his return to Iolcus with Medea as his wife, he avenged the murder of his parents and his brother by putting Pelias to death. But he was unable to retain possession of the throne, and was obliged to resign it to Acastus, son of Pelias, and flee with his wife to Corinth. Here they passed 10 years, until Jason, wearied of Medea, fell in love with Glauce (Creusa, according to some accounts), daughter of Creon, king of Corinth, married her, and put away Medea and her children. Medea, having revenged herself on her hated rival (see MEDEA), fled from the wrath of Jason in her car drawn by winged dragons, the gift of Helios, to Aegues, king of Athens, after she had put to death Mermerus and Pheres, her sons by Jason. According to some, Jason killed himself from grief; according to others he was reconciled to Medea; and still others relate that, after passing a miserable wandering life, he came to his death by accident when, while sleeping in the shade of his old ship *Argo*, part of the stern fell on him.

JASON OF CYRENE, a historian of the 2d century B.C., author of a history of the Maccabees in five books, written in Greek and no longer extant. Although probably Jewish, he may have been Greek. Nothing is known about him except that in II Maccabees 2:24 we are told that this Apocryphal book (see MACCABEES, BOOK OF THE—*Second Book*) is an abridgement of his history.

JASPER, jäs'pēr, city, Alabama, Walker County seat. It is situated in a farming, pine timber, and bituminous-coal-mining region, about 35 miles northwest of Birmingham, at an altitude of 338 feet. It is served by the Illinois Central, the St. Louis-San Francisco, the Alabama Central, and the Southern railroads, and has an airport. The chief regional farm products are corn, cotton, grain, beef, milk, hogs, poultry, and truck crops. The chief local manufactured products are lumber and food products, concrete pipe, asphalt, brassières, and golf bags. Walker Junior College is in Jasper. Settled in 1815, Jasper has a council-manager government. Pop. 10,799.

JASPER, unincorporated community, Alberta, Canada. It is situated at an altitude of 3,472 feet on the Athabaska River at its junction with the Miette, 236 miles west of Edmonton and 185 miles north of Banff. The headquarters of Jasper National Park, the town is reached by highway and

by Canadian National Railways, and has a variety of tourist accommodations, including Jasper Park Lodge. Pop. 2,360.

MAURICE J. BOOTE.

JASPER, city, Indiana, Dubois County seat. It is situated 45 miles northeast of Evansville, on the Patoka River and on the Southern Railway, in a farming, timber, and coal-mining area. Its manufactured products include office furniture and furniture hardware, aluminum sand castings, rubber and concrete products, veneers, lacquer, radio and television cabinets, guitar parts, wood dimensional parts, gloves, wall panels, and processed poultry. Pop. 6,737.

JASPER, city, Texas, Jasper County seat. Located about 60 miles northeast of Beaumont, in a pine timber and farming area, it is a shipping point for cattle and farm products, and has canneries, lumber mills, and some manufacture of wood products. Pop. 4,889.

JASPER, a nearly opaque cryptocrystalline variety of quartz, commonly red, yellow, brown, or gray, sometimes green or blue. It may be banded, and is then called striped or ribbon jasper. It takes an excellent polish, and has been used for ornaments. Jaspilite is a term applied to a rock consisting of bands of red jasper alternating with black hematite, bent and folded by metamorphism.

LEWIS S. RAMSDALL.

JASPER NATIONAL PARK, the largest (4,200 square miles) of the reservations set aside by the Canadian government as scenic and recreational parks. On the eastern slope of the Rocky Mountains, in the Province of Alberta, bordered on the south by Banff National Park, Jasper is noted for the grandeur and variety of its mountain, glacier, lake, and river scenery. The mountains in the park consist of roughly parallel ranges running from the southeast to the northwest. Part of the Columbia Ice Field lies within the southern part of the park. This is the largest body of ice outside the Arctic Circle, and from the ice cap issue numerous glaciers that give birth to rivers whose waters eventually find their way to the Atlantic, the Arctic, and the Pacific oceans. Eleven of the highest peaks in the Canadian Rockies are in the immediate vicinity of the ice field. The Banff-Jasper highway passes close to the tongue of the Athabaska Glacier. Located at the northern end of the park are Miette Hot Springs, with an outdoor pool. The park contains large numbers of all game animals native to the Rocky Mountains. Many of these animals may be seen from the highways and from park trails. Tourist accommodations of all types are provided within the park. In addition to summer recreations, the park is a center for winter sports. It takes its name from Jasper House, a fur trading post established by the North West Company in 1813 on the Athabaska Trail, at the northern end of Jasper Lake.

MAURICE J. BOOTE.

JASPER PLACE, town, Alberta, Canada. It is largely a residential suburb of Edmonton, which adjoins it on the east. An adjacent industrial area is served by a spur line of Canadian National Railways. Pop. 30,530.

MAURICE J. BOOTE.

JASPER WARE, a vitrified pottery bisque developed in England by Josiah Wedgewood (1730–1795). See WEDGEWOOD WARE.

JASSY. See IÄŞI.

JASTROW, jäs'trō, **Joseph**, American psychologist: b. Warsaw, Poland, Jan. 30, 1863; d. Stockbridge, Mass., Jan. 8, 1944. The son of Marcus Jastrow, he was educated at the University of Pennsylvania and Johns Hopkins University, and from 1888 to 1927 was professor of psychology at the University of Wisconsin. He did important research in the field of abnormal psychology and the development, analysis, and correlation of mental processes. His books include *Time Relations of Mental Phenomena* (1890); *The Subconscious* (1906); *Psychology of Conviction* (1918); *Keeping Mentally Fit* (1928); *Piloting Your Mind* (1930); and *The House That Freud Built* (1932). His syndicated articles and radio broadcasting did much to interest the layman in psychology.

JASTROW, Marcus (known also as MORRIS JASTROW), American rabbi and lexicographer: b. Rogasen, Posen (Poznań), Prussian Poland, June 5, 1829; d. Germantown, Pa., Oct. 13, 1903. He was educated at the universities of Berlin and Halle and, after serving as rabbi in Warsaw (1858–1863) and Worms (1864–1866), emigrated to Philadelphia, where he was rabbi of Congregation Rodeph Shalom until his death. He was one of the outstanding leaders of conservative Judaism. His most important published work was the scholarly *Dictionary of the Targumim, the Talmud Babli and Yerushalmi, and the Midrashic Literature* (1886–1903, reprinted 1926).

JASTROW, Morris, American Orientalist: b. Warsaw, Poland, Aug. 13, 1861; d. Jenkintown, Pa., June 22, 1921. The son of Marcus Jastrow, he was brought to the United States as a small child. Obtaining degrees from the universities of Pennsylvania (1881) and Leipzig (1884), he became an authority on Assyrian, Babylonian, and Hebrew religions and literatures. From 1891 he was professor of Semitic languages at the University of Pennsylvania, and from 1898 was also university librarian. Among the best-known of his many works are *The Religion of Babylonia and Assyria* (1898), later expanded in German as *Die Religion Babyloniens und Assyriens* (1905–1912); *The Study of Religion* (1901); *The Civilization of Babylonia and Assyria* (1915); *Zionism and the Future of Palestine* (1919); *The Eastern Question and Its Solution* (1920); and *The Book of Job* (1920).

JASZBERENY, yäs'bē-rân-y', city, Hungary, in Jász-Nagykun-Szolnok County, on the Zagyva River, 37 miles east of Budapest. Its Hungarian name is Jászberény. It is a market and shipping center for a farming area raising wheat, corn, tobacco, and livestock, and has a school of agriculture and a museum of folk art. Pop. (1941) 31,070.

JATAKA, jät'a-kä, a collection of 547 stories concerned with the various incarnations of the Buddha (see BUDDHA and BUDDHISM) antecedent to the famous historical one in which he attained enlightenment, described the Noble Eightfold Path, and set in motion the saving Wheel

of the Law. These stories are known to have been in existence by 380 B.C., and consist largely of an identification of the Buddha-to-be with the heroes—often bird, serpent, or animal—of fables and stories current in India at the time of the actual Buddha's death, if not for hundreds of years before. The stories are written in the Pāli language and form part of the Buddhist Hinayāna canon, whence, it seems, some of them crept into the Sanskrit Mahāyāna *Jātakamālā*, written by Āryaśūra (translated into English by Jacob Samuel Speyer as *Jātakamālā or Garland of Birth-Stories*, Oxford 1895).

Through his exercise of self-sacrificing love during hundreds of incarnations, the future Great Being became ever more expert in the Ten Perfections: goodness, generosity, renunciation, wisdom, patience, truthfulness, energy, resolution, kindness, and equanimity. He rose toward perfect manhood by, as a rabbit, saving the life of a starving hermit by leaping (but only after shaking himself free of precious insect life) into a stewpot which he had urged the ascetic to bring to the boil; by, as the king of a monkey tribe, rescuing his people, though at the expense of his life, from a band of hunters; and by, as a great six-tusked elephant, tearing from his bleeding body the ivory which had excited the rabid desire of a frivolous queen. In other words, the *Jataka* tells how he advanced to full Buddhahood both by positive benevolence and by nonresistance to evil.

Bibliography.—The collection was completely translated into English under the direction of Edward Byles Cowell, 7 vols. (Cambridge 1895–1913), while the ancient Pāli introduction entitled the *Nidāna-kathā or Story of the Lineage*, written about 440 A.D., was translated by T. W. Rhys Davids (Oxford 1880, new and revised edition by Caroline Rhys Davids, London and New York 1925).

RODERICK MARSHALL,
Associate Professor of English in Charge of
Graduate Studies in English and Comparative
Literature, Brooklyn College.

JATIBONICO DEL NORTE, Río, hātē-vō-nē'kō děl nōr'tā, river, Cuba. It originates south of Caibarién in Las Villas Province and flows along the Camagüey Province border for about 40 miles to the north coast. The Río Jatibonico del Sur runs southward to the Caribbean Sea, forming the border between the two provinces for about 60 miles.

JATIVA or **JATIBA**, hātē-vā (formerly XÁTIVA), city, Spain, in Valencia Province, 35 miles southwest of the city of Valencia. It is situated at an elevation of 365 feet on the Albaida River, and on the main railway line from Valencia to Alicante. The market, shipping, and industrial center of a fertile agricultural area producing oranges and rice, it has distilleries, a tannery, cement works, and paper mills, and also manufactures bicycles, linen, knit goods, leather goods, burlap, felt hats, soap, and toys. Founded by Phoenicians, who made it a linen-making center, it became the Roman colony of Setabis (or Saetabis). It fell to the Arabs in 714, was taken by James I of Aragon in 1244, and by Philip V in 1707. The city became the home of members of the Borgia (Borja) family in the 14th century. Pop. (1950) 18,092.

JATROPHA, jät'rō-fā, a genus of tropical and subtropical shrubs and small trees of the surge family (Euphorbiaceae). It includes some

75 American species, 50 from Africa, and a few from India and Arabia; one occurs on beaches in Florida. *J. curcas*, physic nut (q.v.), and *J. multifida*, coral plant, yield oils of economic importance. In addition, about 50 American species (three occurring in the southern United States) are treated by some as a separate genus, *Cnidoscolus*. These are distinguished by very poisonous stinging hairs; the best-known is *J. urens* (or *C. urens*), which with its close relatives is the *mala mujer* (bad woman) of Mexico.

H. W. RICKETT.

JATS, jätz, jôtz, the most numerous tribe or caste of peasant cultivators in the Punjab region (q.v., now divided between India and Pakistan), numbering over 5 million. They are found mostly near Amritsar in Punjab State in India and in the neighborhood of Lahore in West Pakistan, but are scattered throughout the Punjab region and in India extend also into Rajasthan. They are believed to be descended from the Saka, a branch of the Scythians, who entered the Punjab from Central Asia by way of eastern Iran between the 2d century B.C. and the 5th century A.D. The present Jats are skillful and industrious cultivators who usually own their own land; they work their small fields themselves with the aid of their womenfolk, rather than hiring labor. Often they supplement the farm income by engaging in trade. In the 20th century many migrated to Australia, Canada, and California in search of employment; on returning home with their savings, they have become farmer moneylenders.

Jats are famous as warriors; during World War I and after, they enlisted in the British Army in considerable numbers. Three religions are represented among them: Sikh, Hindu, and Muslim. Jats constitute the major group within Sikhism. Since the partition of India and Pakistan in 1947, the Muslims have been concentrated in Pakistan, the Hindus and Sikhs in India. There are also nomadic Jats in West Pakistan who are very like gypsies in appearance and behavior. They migrate from village to village in extended family camps, making and selling tambourines, sieves, and other articles.

ELIZABETH E. BACON.

JAU, zhà-ōō' (formerly JAHÚ), city, Brazil, in the State of São Paulo, 150 miles northwest of São Paulo city. Jau has an airfield and is a trading center for coffee, sugar, rice, potatoes, and livestock. Its chief industries are brewing, distilling, processing cottonseed oil and manioc, and manufacturing furniture and farm machinery. Pop. (1950) 44,141.

JAUNDICE, jôn'dis (ICTERUS), a yellowish discoloration of the skin, mucous membranes, eyes, and other tissues by the bile pigment, bilirubin. The bile pigment, a product derived from hemoglobin of red blood cells, is modified and excreted by the liver to form a component of bile. It is deposited in the tissues as a result of an excess in the blood (hyperbilirubinemia). Excess of bile pigment in the blood with diffusion into and staining of tissues may be a *retention jaundice*, either due to increased formation resulting from excessive destruction of red blood cells and beyond the excretory capacity of the liver (*hemolytic* or *acholuric jaundice*), or due to disease of the liver itself which prevents its adequate modification

and excretion (*toxic* or *hepatocellular jaundice*). A *regurgitation* or *obstructive jaundice* results from reabsorption of bile into the blood when the excretion of bile is prevented by obstruction of bile passages and ducts, either within the liver or in ducts beyond the liver which carry bile to the intestine.

Differentiation of the types of jaundice and determination of the underlying causative disease process is facilitated by observation of associated symptoms and by various laboratory tests. Bile pigment appears in the urine (dark urine) when jaundice results from disease of the liver or from obstruction of bile passages, but not when excessive breakdown of red blood cells (hemolysis) alone is the cause (acholuria). In obstructive jaundice, bile may fail in varying degree to reach the intestine and to color its content, so that stools are lighter in color or even clay colored. In jaundice associated with disease of the liver, a reabsorbed pigment product from excreted bile, urobilinogen, fails to be adequately handled by the liver and appears in excess in the urine.

Jaundice per se may have little deleterious effect, although it is sometimes associated with itching of the skin. In obstructive jaundice, absence of bile from the intestinal tract interferes with absorption of fat and fat-soluble vitamins, including vitamin K, deficiency of which may give rise to a bleeding tendency. A mild injury of the kidneys (cholemic nephrosis) may be associated with bile pigmentation. Pigmentation and damage to basal ganglia of the brain (kernicterus) may accompany severe hemolytic jaundice of newborn children. A slight and transient jaundice is common in newborn children, and without the significance of jaundice which is severe or persistent, or occurs in adults. Hemolytic jaundice may accompany various anemias and blood disorders.

Jaundice due to disease of the liver may be from various viral and other infections (such as infectious hepatitis or yellow fever), or from injury of the liver by various toxins or poisons such as carbon tetrachloride, chloroform, or phosphorus. In jaundice due to obstruction of extrahepatic bile passages, the occlusion may be due to gallstones, tumors, inflammations, or scars. Treatment of jaundice should be directed to determination of the cause and correction of the underlying disease.

W. A. D. ANDERSON, M.D.,

Professor of Pathology, University of Miami
School of Medicine.

JAUNPUR, joun'pōor, city, India, in Uttar Pradesh State, capital of Jaunpur District. It is on the Gumti River, 35 miles northwest of Benares, and is noted as a perfume-making center. It is also a road and railway junction, and a trading center for grains, oilseeds, and sugarcane. In the 16th century it was the capital of a Muslim kingdom extending from Budann and Etawah to Bihar. Among its many fine architectural monuments are a mosque dating from 1376, the 15th century Atala Mosque, a 16th century gateway, and the 16th century bridge over the Gumti. Pop. (1951) 52,351.

JAUREGUI Y AGUILAR, hou'râ-gē ē ä-gē-lâr', Juan Martínez de, Spanish poet: b. Seville, Spain, baptized Nov. 24, 1583; d. Madrid, Jan. 11, 1641. He studied at Rome, Italy, and in 1610 was again in Spain with a reputation

as both painter and poet. He is supposed to have painted the portrait of Miguel de Cervantes Saavedra mentioned in the prologue to *Noveles Ejemplares*, which is believed to be the one now in the possession of the Real Academia Española; and his translation of Tasso's *Aminto* (Rome 1607) is praised in the second volume of *Don Quixote*. His *Rimas* (1618) comprised a collection of charming lyrics, and in its preface the poet severely scored the affectations of the school of Luis de Góngora y Argote.

JAURES, zhô-râs', **Jean Léon**, French socialist and politician: b. Castres, Sept. 3, 1859; d. Paris, July 31, 1914. He taught in Albi and Toulouse, and in 1885 entered politics and was elected to the Chamber of Deputies from Tarn; at this time he was a moderate Republican. In 1889 he failed of re-election, and returned to Toulouse, where he was active in the establishing of a college of medicine. Becoming a Socialist, Jaurès defended the strikers at Carmaux, and in 1893 was again elected to the Chamber, where he became one of the leaders of the Socialists. He failed of re-election in 1898, but was again elected in 1902. When the Socialist Alexandre Millerand accepted a position in the cabinet, Jaurès defended his action, thus opposing Jules Guesde and the *Parti Ouvrier*, but sought at the same time to reconcile the factions. He also took an important part in obtaining a revision of the Alfred Dreyfus case. He stood out as a champion of the workmen in the great strike of 1910. At a Socialist conference in Brussels in the summer of 1914 he made a strong attack on militarism, and declared himself in favor of an international strike for the prevention of war—an attitude which subjected him to severe criticism, and was directly the cause of his assassination by shooting at the hands of a half-demented man outside a café in Paris at outbreak of World War I. He was one of the greatest leaders of French Socialism, and probably the greatest orator in the Chamber of Deputies. He founded *L'Humanité* in 1904, and contributed six of the 12 volumes of the *Histoire Socialiste* (1904–1908).

JAVA, jā'vā, island of Indonesia, fifth largest and most important of the islands of the Malay Archipelago, is bounded on the north by the Java Sea, on the east by Bali Strait, on the south by the Indian Ocean, and on the west by Sunda (Soenda) Strait. Across the 16-mile-wide Sunda Strait lies the great island of Sumatra; and only one mile across Bali Strait, at its narrowest point, is the island of Bali. Madura (Madoera) Island is close to the northeast coast of Java and is considered almost a part of it. Java has a length, from east to west, of 600 miles, and at its widest part it has a width of 125 miles. The area is 48,830 square miles. With a population of 52,756,000 (1952), Java is the most densely populated of the islands of Indonesia.

Djakarta (Jakarta), the capital of the republic and known as Batavia under the former Dutch administration, lies on the northwest coast of Java at the mouth of the Tjiliwong (Tjiliwong) River; it has a population of 2,800,000 (1952). Tandjong Priok (Tandjoengpriok), the port of Djakarta, is six miles to the eastward. The second largest city and port in Indonesia is Surabaya (Surabaya), at the mouth of the Kali Mas River opposite Madura; the population

totals 800,000. Semarang (pop. 250,000) is a port on the north central coast; and Tjilatjap (30,000) is the only safe harbor on the island's south coast. Djokjakarta (Jogjakarta), a city (1,500,000) in central Java, is mainly a spiritual and cultural center; from 1946 to 1950 it was the capital of the republic. Other inland cities include Bandung (750,000), a holiday and tourist resort on the high plateau in the northwest; Surakarta (500,000), 35 miles northeast of Djokjakarta and likewise a center of Hindu-Javanese culture; Bogor (124,000), a scientific center 35 miles south of Djakarta; and Magelang (60,000), site of the immense 9th-century temple of Borobudur (q.v.).

Geology.—Java is formed mainly of tertiary, though partly of post-tertiary strata; but by volcanic action the arrangement has been much disturbed. Rocks containing fossil invertebrates are common, and the fossils of vertebrates have also been discovered. Lignite is found in various parts of the island, and coal is mined in Djokjakarta and Bantam. There are petroleum deposits near Rembang and Surabaya, and also on the island of Madura. Tin is mined, and other minerals include sulphur, asphalt, salt, and manganese. Limestone and marble are plentiful in the southern part of the island.

Topography.—The Indian Ocean, which beats with great force along the south coast, has prevented the formation, on that side, of such alluvial plains as extend along the north coast. From the same cause the south coast is generally unsafe for shipping, while the north affords excellent anchorage at almost all times and places. The south presents a continuous front of crags and rocks, forming the outer edge of an extremely mountainous country. The north is flat and low, and covered in many places with mangrove swamps. Mountains in the wide western section of Java lie, for the most part, close to the southern coast, the land sloping abruptly to the Indian Ocean and, on the north, descending gently across rich agricultural country to the Java Sea. In the center of the island, the mountains are situated roughly midway between the north and south coasts and virtually constitute a range. The mountains and lowlands are irregularly intermixed in the eastern section of the island.

The whole configuration of Java has been transformed by volcanic action. There are 20 or more mountain peaks with elevations exceeding 8,000 feet, and more than 100 volcanoes, of which 13 are still active. Semeroe (Semeru), 12,060 feet in height, is an active volcano and the highest mountain in Java; it is in the eastern part of the island, southeast of Malang, and joins with the Tengger Mountains, to the northward. Salak (7,254 feet), in western Java, had severe eruptions in 1669 and 1699 but is now extinct; Gede (9,705 feet), 45 miles southeast of Djakarta, has had many eruptions since 1832; Papandayan (8,744 feet), 12 miles southwest of Garut (Garoet), western Java, erupted violently in August 1772, destroying some 3,000 persons; Galunggung (7,221 feet), 10 miles east of Garut, had a destructive eruption in 1822; Tjikoeraj (9,255 feet) is the highest extinct volcano in the mountain groups around Garut; and Slamet (11,247 feet), in west central Java, is also inactive. The eruption of Krakatoa (q.v.), the volcanic island in Sunda Strait, in August 1883 was the most tremendous of modern times; it killed 36,000 people in western Java. The island is sub-

ject to earthquakes, though as a rule they are not severe. Three earthquakes are known to have preceded and 19 accompanied volcanic eruptions. A most destructive earthquake occurred in 1867.

Rivers flowing into the Indian Ocean, to the south, are short and rapid; while those flowing northward, into the Java Sea, are longer and more suitable for navigation. The longest river is the Solo (335 miles in length), which empties into the Java Sea opposite the west end of the island of Madura; in its lower course it is known as the Bengawan. The Brantas (195 miles) also known as Kediri, flows into Madura Strait in two branches, on one of which (named Kali Mas) stands Surabaya; it is navigable as far as Kediri. The capital city of Djakarta stands at the mouth of the Tjiliwung (50 miles), which rises on the northern slopes of Mount Pange-rango.

Climate.—During the day the temperature of the plains and valleys ranges from 85°F. to 94°; and during the night from 73° to 80°. The mean temperature at Djakarta is 78.69°F. At an elevation of 6,000 feet the thermometer descends to 60°, while the tops of the highest peaks are often covered with ice, but no snow falls. The breezes from the sea modify the temperature. There are two seasons: the dry from April to October, and the rainy season from November to March. During the rainy season there is an almost continuous rainfall except for a short time in the morning. The annual rainfall is about 80 inches. The island is not subject to storms which injure life or property, but near the high mountains there are frequent thunderstorms.

Fauna.—Including domestic and marine animals, at least 100 kinds of mammalia inhabit Java. In the western area the one-horned rhinoceros is not uncommon; and in the higher elevations the royal tiger, panther, and wild cat keep the inhabitants in constant alarm by their depredations. Wild pigs of two different species are most destructive of crops. There are only two species of the ape kind, but they people the forest in countless numbers. Two kinds of lemurs inspire the inhabitants with superstitious fear by their mysterious nocturnal habits; and this island may be esteemed the native seat of the largest bats, some of which measure five feet across the wings. They may be seen suspended from the branches in hundreds during the day, and at night they devastate the orchards and gardens. Two civets are common and supply a perfume of which the Javanese are passionately fond; the wild ox abounds in the woods; and the buffalo is the only animal used in agricultural labor. The horses are small, but vigorous, and, as in India, are not used for agricultural purposes. Two species of wild dogs and six species of deer are found here. Among the domestic animals are the buffalo, ox, horse, goat, and sheep. The ornithology of Java is rich and varied, both in genera and in species. About 300 species of land birds have been found on the island, among them the peacock, partridge, quail, 10 different species of pigeon, 11 species of heron, two of cuckoo, the woodpeckers, the black and crimson oriole, the hornbill, eagle, owl, the brilliant looking and appropriately named minaret flycatcher, and the "swift" (q.v.); and the mino bird, so apt in learning to mimic human speech, is common. Almost all the known generic groups of rapacious birds are found here in great num-

bers, and gallinaceous fowls are plentiful. A variety of reptiles are found on the island, among them the python. Insects cover the grounds and plants in countless numbers; but few are distinguished for brilliancy or variety of color, or are remarkable in form. Fish are plentiful in the rivers and along the coast; but those of the rivers are of inferior quality for food. Excellent oysters are abundant on the north coast, and prawns, from which a condiment called trasi is prepared, are considered delicious by the natives. Crocodiles from 20 to 30 feet in length inhabit the watercourses.

Flora.—With a temperature ranging from 94°F. to the freezing-point, a volcanic soil plenteously watered naturally and artificially, it is not surprising that Java should be of astonishing fertility; the range of its vegetation naturally follows that of its temperature, from the palms of the tropics to the mosses of the temperate zone. Mangrove swamps fringe most of the coast line, and a short distance inland occur the coconut, nipa, and other palms. Low hills are covered with alang-alang grass, 3 to 4 feet high, wild sugar cane, acacia, and bamboo—the last frequently of immense size. Most of the cultivated crops, particularly rice and sugar, grow at elevations below 2,000 feet. The vast forests cover a very extensive surface. In the rain forests are magnolias, a great variety of vines, rattans, and at least 80 species of fig trees, which are remarkable for their great height and vigorous growth. The dense forests of central Java contain the valuable teak tree (which sheds its leaves in June and buds again in October), mahogany, camphor, and many other forms of vegetation. These are followed still higher up by the plane-like liquidambar, with their erect stems covered with parasites, and *Rubiaceae*, the latter of numerous species; some of them exhaling a very fetid odor. Along the upper limits of the liquidambar, about 4,000 feet above sea level, lofty trees are still plentiful. Here may be seen *Podocarpus cupressus*, with its lofty straight stem, a tree allied to the yew and furnishing the best timber in Java. There are also the dammar pine, rhododendrons, laurels of numerous species, chestnuts, oaks, magnolias, myrtles, and other vegetation common to the temperate zones. About an elevation of 7,000 feet the vegetation changes its aspect. Mosses appear, and these, with heaths, are the principal plants found on the loftier peaks.

The People.—Although Java comprises only seven per cent of the land area of Indonesia, it supports two thirds of the archipelago's people, and is one of the most densely populated islands of the world. The three main ethnic groups are people of the Deutero-Malay race. The whole of central Java is occupied by the Javanese, who comprise about three quarters of the population; they are also found on the north coast to the westward and on the south coast eastward. The Sundanese, who form about 15 per cent of the population, live at the western end of the island at the higher elevations; and the Madurese, about 10 per cent of the population, are found in eastern Java as well as on the neighboring island of Madura. All three races are shorter than Mongolians and Caucasians. The shortest and the most sturdy are the Sundanese, and their eyes are more slanted than those of the Javanese and Madurese. In general, it may be said that all three races are light brown in color, and the hair of the head is black, thick, lank, and harsh; a

few, short straggling hairs compose the beard, and on other parts of the body hair is either scanty or altogether wanting. The people are patient and enduring, but they are most susceptible to affronts, which they are not slow to avenge with the kris—a dagger having a serpentine blade. All the people, without distinction, are passionately fond of gaming, more especially of cockfighting. Most of the people, being agriculturists, live in small villages. Their houses are light structures of bamboo, built upon the ground except in the case of the Sundanese, who raise them on piles several feet above the ground. Leaves of the nipa palm or alang-alang grass are used for thatching the roofs of the houses, and bamboo, split and flattened, provides the walling; the floors are of pounded earth.

Religion.—The advent of Indians in the 11th century brought Buddhism to Java. This was largely displaced in the 15th century, however, when Arab conquerors arrived and influenced Javanese life with Moslem culture. Islam was eventually embraced by 90 per cent of the people of Java. There still remain some primitive Animists, and Christianity has some 2,000,000 adherents. The polygamy permitted by Islam continues to be practiced by wealthier Javanese, but most of the people are monogamous.

Language.—It is not certain whether the name of Java be connected with the Sanskrit Javanna and Yavana, both of which, besides being related to Ἰωνία as names of Greece, also signify (especially the latter) Bactria, Arabia, and other foreign countries, and, moreover, swift, horse, etc.; or whether its etymon be of a different origin. The Javanese is the most cultivated of all Polynesian languages, owing to the very early intercourse of the island with the continent of India, whose Aryan as well as Dravidian influence is attested by the presence of Malabaric words along with those from the Sanskrit, not only in Javanese, but also in the idioms of Sumatra, Madagascar, and other islands. Both religious and political revolutions have served to modify the condition of the languages.

There are four dialects on the three islands which form the linguistic group in question, namely: (1) the tongue of the mountaineers of Sunda, in the western part of Java, east of Tagal, probably vernacular through this whole region before the introduction of Islam, now spoken by about one tenth of the population of the island; it contains many Malay and some Sanskrit words, stands in the same relation to the principal language as the Welsh does to the English, and is best spoken at Bantam, sluggishly at Bogor and Chianjore and verging to the Javanese at Cheribon. (2) The Javanese proper, east of the last-named city, extending through the rest of the island, especially along its north shore; its words are long at Tagal, shorter at Samarang, full, short and strong at the courts of Surakarta in the center and Djokjakarta in the south; it approaches the Madurese at Surabaya and the Balian at Banyuwangi. (3) The dialect of Madura and Sumanap, which has many Sunda words, with more of Malay, and with peculiar endings. (4) That of Bali, little different from the general Javanese. This island preserves the ancient letters as well as Brahminism, both expelled from Java in the 15th century. A sort of jargon, analogous to the *lingua franca*, is spoken at Djakarta, being a medley of Dutch, Portuguese, Javanese, and Malay.

Along with the preceding there are also peculiar styles or idioms of speech, varying in accordance with social position and age, as the *madhjo* (intermediate), between equals; the *bása* or *bohoso-ngoko* (language popular), to inferiors; the *bása-kramo* (language superior), urbane, court idiom, about three fourths of it Sanskrit, used by poets as the speech of gods, heroes, and ghosts. As to locality, there are also two vernacular idioms, namely, the *bása-dalam* of the interior and the *bása-luar*, spoken along the shores. The Kavi (learned, wise, poet) is the ancient sacred language of Java and consists of about six parts of Sanskrit, less altered than in the Pali, to four of Javano-Malay. It owes its origin to Brahminic immigration, about the beginning of our era. It is to the Javanese what Sanskrit is to the Hindostani, and Pali to the Indo-Chinese languages. Declining in the 14th century, it took refuge in Bali and was imperfectly known by the Panambahan at Sumanap at the time when Sir Stamford Raffles (q.v.) was in Java. Passages in the Kavi are sometimes quoted on peculiar occasions, as for instance in fables and dramas; the term itself is employed as a title of works, etc., such as *Sekar-kavi*, flowers of poetry, whence *Sekarini*, a Kavi meter; *Ramakavi*, the Javanese Ramayana; *Kavindhra*, principal singer or poet (named *ma-kathā*, narrator, in Tagala). A few specimens of words may show the relation of the Javanese to the common Malay, where the difference, if not specially noted, is sometimes more in the accent than otherwise: *langit*, heaven; *tanah*, earth (Mal. also *benua*, region); *ayer* (Jav. also *banyu*), water; *laut* (Jav. *lahut*), sea; *dhina* (Mal. *hāri*), day; *bengi* (Mal. *mālam*), night; *vulan* (Mal. *bulan*), moon; *terang* (Mal. *trang*), light; *mati*, to die; *lulat* (Mal. *kāsih*), to love; *dara*, virgin; *dhēva* (Mal. *tuhan*), god, lord; *mangan* (Mal. *mākan*, *santap*), to eat; *bāpa*, pak (Mal. *pā*, politely *ayah*), father; *ma*, *bok* (Mal. *mā*, *amā*, politely *ibu*, *bonda*), mother, etc. Compounds and derivatives abound, but the latter are more frequently formed by suffixes than by prefixes, in which the Tagala is very rich. There are many contractions into *tr*, *ngr*, *ngr*, with the dropping of short vowels, together with the alteration of the initial sound (similar to the Celtic), and other variations which obscure the etymic origin, thus: Sans. *nātha*, master, lord, becomes *tata*, order, to reign; Jav. *neda*, to eat, *teda*, food; *nulis*, to write, *tulis*, scripture; *nitik*, to prove, *titik*, proof. The prefix *n* denotes verbs, *t* substantives; other changes are: *nyatur*, to tell, *chatur*, tale; *nyerrat*, to write, *serrat*, writing, etc. The doubling of the first syllable makes verbs, as *tutulung*, to help, from *tulung*, aid; *gagriya*, to dwell, from *griya*, house. The insertion of *in* is the sign of the passive voice. Substantives are also made by prefixing *pem* (*pen*, *pe*), denoting an agent; thus: *pem-pekto*, carrier, from *pekto*, to carry; *pen-dahar*, eater, etc.; by prefixing *ka*, a sign of the past participle; *kabekto*, Lat. *allatum*; by suffixing *n* (*en*, *an*): *bakt-en*, the carrying, *dahar-an*, Lat. *cibus*; and by both prefix and suffix: *ka-da-har-an*, an eatable. Articles, gender, and the dual number are wanting. In the plural, cases are denoted by particles, and also by reduplication, as in Japanese. The genitive relation is shown by the precedence of the noun or by inserting *ing*. The other relations of case are indicated by means of verbs. The adjective is unchanged after the

substantive. Pronominal forms are fewer than in Malay: *kita*, we in Malay, means I in Javanese.

Literature.—The literature, which is in Kavi, dates from about the commencement of our era, and is rich, especially in legends concerning cosmogony. The subjects of the works are mostly either of a mythical or ethical character. Prominent among the former are the *Kānda* (Sans. *Khandata*, fragment, section), *Pepakem* (book), or *Sejarah* (history); *Manek-Maya*, a mythical genesis, in which Buddhism predominates; *Vivaha-Kavi* (matrimonial poem), about a *Rasaksa* (evil spirit) who courts a *Vidaduri* (nymph); *Rama-Kavi*, the Javanese *Ramayana*; *Parikespit*, "Arjuna's Grandson"; *Mintaraga*, a poem on Arjuna in the Indra mountain. This kind of composition comes down to the time of Aji Saja Baya. Of the ethical order are the *Niti Sastra Kavi*, in the purest style, of about the 13th century; and *Śrūti*, which already alludes to Islam. But the *Brata Yudha* ("Holly War") is an epos mostly on the deeds of Arjuna; being an episode of the Mahabharata, in 712 stanzas, with varying rhymes. The *Sastra Menawa* is a Javanese imitation of the ordinances of the Indian Menu. Indeed, most of the Kavi works are such imitations. Whether mere versions of Sanskrit works have been made or still exist is not precisely known; but there are many Javanese versions from the Kavi. Javanese literature abounds in romantic compositions, mostly of elegiac form. Among these, the adventures of the popular hero Pandji are most prominent. Dramas, and especially puppet shows, called *wayang* (shadows), and with figures of either leather or wood personating heroes, are popular.

Production.—The vast majority of the people of Java are engaged in agriculture, despite the fact that the great cities are of major industrial and commercial importance. There is a small class of fishermen on the sea coasts and an increasing number of urban residents are skilled artisans, but most Javanese live directly or indirectly by the cultivation of the land. Rubber, sugar, coffee, tea, and cocoa, the principal economic crops, have long been cultivated on immense foreign-owned plantations, and since establishment of the republic following World War II an increasing number of these products have been grown by small farmers. The island also produces some 90 per cent of the cinchona bark from which quinine, the specific for malaria, is manufactured; and other products which are exported include copra (the dried meat of the coconut), palm oil, kapok (a silky fiber used to fill mattresses), and sisal hemp. Rice, the staple foodstuff in Java, is produced on a great scale; with the aid of irrigation two crops can be raised each year. Sugarcane and tobacco are also cultivated, and other crops include corn, cassava, peanuts, soya beans, and capsicum.

The forests yield teak and other valuable woods, many of them exported, while coal is mined and petroleum is produced in several parts of the island. The Javanese practice about 30 crafts, some of them of considerable antiquity and of high artistic standard. They excel all others in the archipelago in the working of metals, being especially skillful in the manufacture of the kris—the dagger customarily worn by every man and boy above 14 years of age; the kris is also worn by many ladies of high rank. Excellent gongs and other musical instruments of brass are also made; there is a ready market for them in

neighboring countries. Silverwork is also a highly developed craft. The only textile material woven by the Javanese is cotton, of which they make only a stout durable calico; this is purely a domestic manufacture, carried on exclusively by the women. Women also weave a coarse cloth from raw silk imported from China. The Javanese are widely known for the process of dyeing cloth known as *batik*, in which wax is applied to those parts of the cloth not to be dyed; the threads are dyed before weaving in a more complicated textile process known as *ikat*. Textiles of both *batik* and *ikat*, of great artistic merit, are worn by men and women alike. Paper of the nature of the ancient papyrus is a manufacture peculiar to the Javanese.

History.—Between the 1st century A.D. and 700 A.D. Java was overrun by Hindu princes from India, who introduced Buddhism. Javanese history at this period is written in the still existing magnificent remains of temples and other public buildings, which are plentifully scattered over the island. Near Prambanan (Brambanan) are the ruins of many Hindu temples, one of them dating from the 9th century, which are eloquent of the magnificence of the period in Java. At Borobudur (q.v.), near Magelang, is probably the largest Buddhist temple in the world; perched on the summit of a hill, above which it towers to a height of 120 feet, it is adorned with 998 bas-reliefs illustrating the life of Buddha. These and similar remains attest that the worship of Brahma and Buddha once prevailed in the island. Between 1335 and 1380 the state of Majapahit, in eastern Java, conquered the Sriwidjaja empire of Sumatra (which had had its beginnings in the 7th century) and extended its influence to include almost the whole of the Malay Archipelago. In turn, the Moslems had seized most of the colonies of Majapahit by about 1478, after a period of internecine strife, and by 1518 Majapahit itself had been totally destroyed. Bantam and Mataram were the most powerful Moslem states in 1511, when the Portuguese, the first of a succession of European traders, arrived. The Portuguese were followed in 1595 by the Dutch, who soon eclipsed them. In 1619 the Dutch established their capital on Java at Batavia, a town built on the site of Djakarta (Jakarta), chief port for the Sundanese kingdom of Padjadjaran, and from that point gradually extended their influence through most of the island. Java was occupied by the British from 1811 until 1816. In 1825 the Dutch authorities were confronted with a large-scale revolt which was not put down until 1830. The Dutch decreed abolition of slavery in Java on Sept. 20, 1859. The Javanese had never had slaves, and there were but a few thousand on the island. During World War II Java, together with all the Malay Archipelago, was occupied by Japanese forces. With Japan's surrender the Dutch attempted to reestablish their authority in Java, but were compelled to acquiesce in creating the independent Republic of Indonesia. Batavia, resuming its ancient name of Djakarta, became the capital of the republic in 1950. See also INDONESIA, REPUBLIC OF.

JAVA SEA, part of the Pacific Ocean between Borneo and Java and east of Sumatra. It is about 200 miles wide, 600 miles long, and shallow, with a maximum depth of about 300 feet. In February–March 1942, during World War II, it was the area of the Java Sea Battle, in which the Japanese defeated Allied naval forces.

JAVA SEA, Battle of the. See WORLD WAR II—9. *War in the Southern and South-western Pacific.*

JAVARI, zhà-và-ré', or **YACARANA,** yà-kà-rá'ná, river, South America, rising on the Peru-Brazilian border, about latitude 7° S. It flows north and northeast into the Amazon River and is navigable for about half of its length. The greater part of its course of about 650 miles forms the boundary between Brazil and Peru.

JAVELIN, jāv'lin; jāv'ě-lin, a short, light spear thrown by hand. In ancient warfare it was used by both horse and foot soldiers. The *pilum* of the Romans was a weapon of this description and could be thrown or thrust. The shaft was four and one-half feet long and the barbed iron head was of equal length, but, as it extended halfway up the shaft, the whole length of the weapon was about seven feet.

In ancient and medieval times hunters of large game often used javelins. The small spears of many savage tribes are called javelins. Throwing the javelin has been one of the contests in the Olympic games (q.v.) since 1908.

JAY, jā, **SIR James,** American physician: b. New York, N.Y., Oct. 27, 1732; d. Springfield, N.J., Oct. 12 or 20, 1815. He was an older brother of the statesman and jurist John Jay (q.v.). He received his medical degree from the University of Edinburgh in 1753 and began practice in New York City, but became dissatisfied and went to London, where in 1762 he agreed to collect funds for King's College (now Columbia University). When Jay found that the Reverend William Smith was there on a similar mission for what is now the University of Pennsylvania, they cooperated and raised about £10,000 for each institution. King George III knighted Jay in 1763.

After the outbreak of the Revolution, Jay, apparently sympathizing with the American cause, invented an ink which he used in communicating to the colonies military information obtained in England. He returned to the United States in 1778, was a member of the New York Senate from 1778 to 1782, and there aided John Morin in the passage of the Act of Attainder (1779), by which the property of prominent New York Loyalists were confiscated. In April 1782 he was captured by the British, but was released by Sir Guy Carleton and was allowed to go to England. Thereafter even his brother John doubted his patriotism. After practicing medicine for a time in England and on the Continent, he returned to the United States.

Jay was a trustee of the College of Physicians and Surgeons (New York), 1807–1811, and his

name appeared in the charter of the college in 1791.

JAY, John, American statesman: b. New York, N.Y., Dec. 12, 1745; d. Bedford, N.Y., May 17, 1829. Patriot, statesman, legislator, jurist, diplomat, descended from old Huguenot and patrician Dutch settlers of New York, Jay graduated from King's College (now Columbia University) in 1764, studied law, and was admitted to the bar in 1768. He married, April 28, 1774, Sara Van Brugh Livingston, youngest daughter of William Livingston (q.v.), the revolutionary governor of New Jersey.

Jay's first responsibility in his career of public employment was as secretary of the Royal Mixed Commission appointed in 1773 to settle the disputed boundary between New Jersey and New York. The success of this commission may have been the precedent in Jay's experience for the mixed commissions later created in the famous treaty of 1794 with England, arbitral commissions which in turn afforded a precedent for later United States treaties.

The public disputations preceding the American Revolution soon put an end to Jay's law practice and diverted him into public service. As a member of the New York Committee on Correspondence and of the Continental Congress, he opposed independence as inviting mob rule and chaos. He was absent from the Continental Congress on the day when the vote for independence occurred, but, once the fateful step was taken, he adhered patriotically and unwaveringly to it. As chairman of a committee in the New York Provincial Congress, he immediately drafted the resolutions confirming independence (July 9, 1776). He also had a leading part in the state convention that drafted the constitution of New York and served for a few months as first chief justice of his state. He was elected president of the Continental Congress, Dec. 10, 1778. Congress sent him, as its ranking member, to Spain in 1779 as a minister plenipotentiary, seeking recognition of the United States, financial succor, and military alliance in the war against Great Britain. But Spain refused to recognize the independence of the United States, although she entered the war as an ally of France. Jay and his wife lingered in Spain until the spring of 1782, when he joined Benjamin Franklin in Paris as a member of the United States commission for the negotiation of peace with Great Britain.

In these negotiations Jay played an important part, if not the leading role. He insisted that the British commissioner be empowered to treat with plenipotentiaries of the United States of America instead of with those of individual "Colonies." Suspicious of secret French missions to London, he privately urged the British government to come to a quick peace with the United States which might thereby cut the ties that bound the new nation to France. He influenced his fellow commissioners to sign separate, but *conditional*, preliminary articles of peace with Great Britain without prior approval by the French government, thereby violating their instructions but not the Franco-American alliance and its pledge against any separate peace.

After signature of the final peace treaties, Jay declined the post of minister to Great Britain or to France and chose to go home, yearning for the comforts and the pleasures of private life. But Congress had already appointed him as its

secretary of foreign affairs, and the experienced Jay accepted the burden of that office. His most important negotiations as secretary of foreign affairs (1784-1789) were with Great Britain and Spain, concerning commerce and frontier disputes, including Western Indian tribes and (in the case of Spain) navigation of the Mississippi River; but neither came to any conclusion, if only because of the weakness of the government under the old Articles of Confederation. Upon the organization of the new national government under the new and still-continuing Constitution, President George Washington appointed Jay as first chief justice of the United States. The most important case which Jay decided during his tenure as chief justice (1789-1795) was *Chisholm vs. Georgia*, which affirmed the right of a citizen of one state to sue another sovereign state in the Union. This decision led to the quick adoption of the 11th Amendment to the Constitution, which had the effect of strengthening states rights by reversing in principle Jay's decision.

During the war crisis of 1794 with Great Britain, President Washington, upon the advice of Alexander Hamilton and other Federalist leaders, sent the chief justice to England as envoy extraordinary and minister plenipotentiary on a special mission to reach a peaceful settlement. After several months of negotiation with Baron Grenville (William Wyndham Grenville, 1759-1834), he signed, on Nov. 19, 1794, the celebrated treaty which bears his name in United States history (see JAY'S TREATY). Jay's treaty might just as well be called Hamilton's Treaty, because the private letters of Hamilton to Jay were more influential than his official instructions penned by Edmund Randolph, the secretary of state. It was the price which the Federalists paid for a continuation of United States neutrality in the war between France and Great Britain and for support of the new nation's financial credit, under Hamilton's fiscal system.

Upon his return to New York in 1795, Jay resigned as chief justice in order to serve as governor of New York, to which office he had been elected during his absence and which he occupied until 1801. His integrity as governor is reflected by his rejection of Hamilton's proposal, after the Republican victories in the state and national politics in 1800, that Jay call a special session of the expired Federalist legislature to choose Federalist electors for the presidency before the newly elected legislature should meet to designate Republican electors who would vote for the Republican candidate, Thomas Jefferson. The closely contested presidential election, Hamilton pointed out, would depend upon the votes of New York. Jay rejected this political trickery, and wrote on Hamilton's letter urging the stratagem: "Proposing a measure for party purposes which I think it would not become me to adopt."

Following the Republican triumph, Jay spent the rest of his life, 28 years, in complete retirement, saddened by the death of his wife on May 28, 1802. At his death he left one daughter, who died without issue, and two sons. Both sons, Peter Augustus Jay and William Jay (q.v.), had distinguished political and civic careers, as they carried the Jay family into continuing generations.

JAY, John, American lawyer and diplomat: b. New York, N.Y., June 23, 1817; d. there, May 5, 1894. He was the son of William Jay, American jurist, and grandson of the statesman John Jay (q.v.). After graduating from Columbia College in 1836, he studied law in New York City, and was admitted to the bar in 1839. He became a prominent opponent of slavery and was counsel for several fugitive slaves; and at a meeting held at the Broadway Tabernacle in New York City in 1854, he drafted resolutions, which were adopted, opposing repeal of the Missouri Compromise. At Syracuse, N.Y., in September 1855, he took a leading part in organizing the New York State Republican Party. From 1869 until his resignation in 1874 he was United States minister to Austria; in 1877 was appointed chairman of the so-called Jay Commission for the investigation of the New York customhouse administration; and during 1884-1887 was the Republican member of the New York State Civil Service Commission and helped to frame the state's first civil service law. He was a founder of the American Geographical and Statistical Society (1852); and of the Union League Club (1865), twice serving as its president (1866, 1877); was a charter member of the Huguenot Society of America and its first president (1883-1894); and long was corresponding secretary of the New York Historical Society. In 1890 he became president of the American Historical Association.

JAY, William, American jurist: b. New York, N.Y., June 16, 1789; d. Bedford, N.Y., Oct. 14, 1858. He was the son of the statesman John Jay (q.v.) and, after graduating from Yale College in 1807, studied law with John B. Henry at Albany, but because of defective eyesight was obliged to withdraw from the profession. He began to farm the family estate at Bedford and became interested in various philanthropic movements, including the antislavery cause. A founder of the American Bible Society (1816), he long defended it against attacks by the Right Reverend John Henry Hobart, Episcopal bishop of New York. From 1818 to 1843, with one short interruption, he was judge of the court of Westchester County. From 1835 to 1837 he served as corresponding foreign secretary of the American Anti-Slavery Society. He wrote much on antislavery and was recognized as a leader of the more conservative of the abolitionists. Among his publications were *The Life of John Jay* (2 vols., 1833); *An Inquiry into the Character and Tendency of the American Colonization, and American Anti-Slavery Societies* (1835); *War and Peace: The Evils of the First and a Plan for Preserving the Last* (1842, reprinted 1919); *Miscellaneous Writings on Slavery* (1853).

His brother, PETER AUGUSTUS JAY (1776-1843), was also a lawyer and was recorder of New York City during 1820-1821.

JAY, town, Maine, in Franklin County, on the Androscoggin River, 28 miles north of Lewiston, on the Maine Central Railroad. Granite quarries, paper and pulp mills, and a shoe factory

are within the town limits. Pop. 3,247.

JAYADEVA, jū'yā-dā'vā, the last great writer of Sanskrit: fl. 1200. The details of his life are unknown; but his *Gītāgōvinda* (*Song of the Divine Cowherd*) is a fine religious drama written in lyric verse, divided into 12 short cantos or scenes, with provision for musical accompaniment and dancing. It is best considered as a mystery play, the union of the soul with God being adumbrated in the loves of the god Krishna (q.v.), here represented as a cowherd, and Rādhā, a milkmaid. Krishna's immense and apparently willful infidelity to Rādhā and his later return to her may be taken as symbolical of the imponderable ways of God to man. The climax of the mystery comes when the finite mind (Rādhā) ceases to question the infinite soul (Krishna), submitting itself nakedly and without reserve to the divine will. Fortunately God thirsts for his devotee as much as she for Him. In Indian fashion, this love lore is conveyed in language which evokes a golden mirage of sensual passion, but Jayadeva's audacious eroticism may be compared with that of *The Song of Solomon* or of the pairs of sculptured lovers who glorify many ancient Indian temples. The final effect of such art is delicate rather than gross, a mood of intense spiritual exaltation. The sex feeling that dominates the physical creation is seen to be the chief nourisher of the soul itself.

The *Gītāgōvinda* has found three good English translators: Sir William Jones, "Gitagōvinda: or, The Songs of Jayadēva," *The Works of Sir William Jones*, vol. 1 (London 1799); Sir Edwin Arnold, tr., *The Indian Song of Songs*, . . . (London 1875); and Puran Singh, "The Gita Gobind: When Love is Prayer," in *The Spirit of Oriental Poetry* (London and New York 1926).

RODERICK MARSHALL.

JAYHAWKER, jā'hōk-ēr. Though the origin of the term has not been established, it appears to have been known in the Middle West and California as early as 1849, as a homespun term for a freebooter. During the Kansas-Missouri border warfare (1857-1859) over the slavery question, bands of Free State men were called jayhawkers. The term was also applied later to Union guerrilla bands in the Civil War. United States Senator James Henry Lane of Kansas declared in 1861 that "the people of Kansas are neither thieves, plunderers, nor jayhawkers." The term has lost its opprobrium with the passage of time, for Kansas has adopted the nickname Jayhawker State and Jayhawker is the popular nickname for a citizen of Kansas.

JAYNE, jān, **Horace Fort**, American biologist: b. Philadelphia, Pa., March 17, 1859; d. Wallingford, Pa., July 8, 1913. He was the son of a physician who became a wealthy drug manufacturer, and he himself studied medicine at the University of Pennsylvania, where he took his medical degree in 1882. Between 1882 and 1884 he also studied at the universities of Leipzig, Jena, and Johns Hopkins. He became professor of vertebrate morphology at the University of Pennsylvania in 1884 also serving as dean of the college faculty (1889-1894) and of the faculty of philosophy (1890-1894). He helped to found the school of biology, contributing liberally to its building fund, and for more than 10 years from 1894 directed the university's research institution,

The Wistar Institute of Anatomy and Biology, wherein he also was professor of zoology (1896-1904). He was the author of *Anatomy—A Preparation for Human and Comparative Anatomy* (1898) and of important scientific papers.

JAYS, jāz, a group of passerine, or song birds, closely related to magpies and crows and forming with them the family Corvidae. The family is a large one with about 100 species, of which about 40 are jays. The jays inhabit the

(Top) Allan D. Cruickshank from National Audubon Society; (bottom) Charles J. Ott from National Audubon Society

Above: Blue jay. Below: Canada jay.

boreal, temperate, and tropical regions of the New and the Old Worlds, with the exceptions of Australia and tropical Africa, but are more numerous in the New World with about 32 species. They are strictly arboreal, inhabiting coniferous, deciduous, or mixed forests as well as the chaparral or other scrub in the American Southwest and in Mexico. They are of medium size and usually colorful, various shades of blue predominating in their plumage, though some are gray, brown, green, or reddish. The jay is noted for its great boldness and noisy habits, but it can be furtive and quiet when occasion demands; and not all the species are bold, some being quite shy or very confiding in man. Their food is chiefly vegetarian, consisting of large seeds, such as acorns, of which they are very fond, or other seeds, such as

beechnuts, corn, and small nuts. In summer they become insectivorous and are not above robbing the nests of small birds for eggs or nestlings if they are left unguarded.

Among the better known jays are the common jay (*Garrulus glandarius*) of the Old World, a widespread and beautiful large species with a rich vinaceous coloration. In North America the best known is undoubtedly the blue jay (*Cyanocitta cristata*), a handsome, bold ruffian with bright blue wings and tail and a jaunty crest. The blue jay ranges westward to the Rocky Mountains and is replaced in those mountains and to the west by other crested, but darker, species such as Steller's jay (*C. stelleri*). Two other notable American jays are the scrub jay (*Aphelocoma coerulescens*) and the Canada jay (*Perisoreus canadensis*). The first is found in Florida and again in the West and is blue and lavender, but without a crest. The Canada jay, often called the camp robber, is gray and white and looks exactly like a huge chickadee. It inhabits only the coniferous forests of the north and is very tame and a pleasant companion much attracted to man.

CHARLES VAURIE.

JAY'S TREATY. Jay's Treaty of 1794 with Great Britain, by adjusting grave and perilous problems with England (frontier posts and boundaries, Indian relations, prewar debts to British creditors, treatment of returning British Loyalists, regulation of commerce) remaining from the treaty of peace and independence of 1783, preserved Anglo-American amity while the new federal government of President George Washington was becoming firm in a successful experiment of nationhood, and it confirmed the neutrality of the United States in the wars of the French Revolution.

Matters came to a war crisis in 1794, during the European War, after seizures of American neutral ships bound for French belligerent ports, according to dictates of arbitrary British naval orders in council; at the same time, the governor general of Canada made a hostile speech to a delegation of western Indians from United States territory to the effect that they and the king's warriors would soon be fighting side by side against the United States.

At the behest of Alexander Hamilton and other Federalist leaders, President Washington sent Chief Justice John Jay (q.v.) to London, where he negotiated and then signed, on Nov. 19, 1794, the celebrated treaty bearing his name. In turn for a promise to evacuate the northern posts by June 1, 1796, Great Britain secured acquiescence by the United States in the substance, but not the principle, of her naval measures for the duration of the war and agreed to arbitrate United States claims for naval spoiliations under color of British orders in council. The United States on its part agreed to the arbitration of claims of British prewar debtors and payment of awards by the United States government. At the same time provision was made for mixed commissions to settle disputed stretches of the uncertain Canadian-American boundary line in the north. (These commissions had no success, except for establishing the identity of the boundary river, the St. Croix, on the northeastern frontier.) The two parties also asserted the right of their citizens and subjects to the free navigation of the Mississippi River from its source to the sea (without mention of Spain!). Finally, the

treaty regulated commerce between the British Isles and the United States without discrimination between British subjects and United States citizens.

John Jay conducted these negotiations nominally under instructions from Secretary of State Edmund Randolph, but actually under private injunctions from Secretary of the Treasury Alexander Hamilton; the treaty was really more Hamilton's treaty than it was Jay's treaty. After heated discussion throughout the United States, the Senate, by a bare two-thirds majority of senators present, advised and consented to the treaty, and the president, after some hesitation, signed it, and ratifications were exchanged. The House of Representatives voted the necessary appropriations by a majority of only three votes.

There is little doubt but that Jay's Treaty saved the peace between Great Britain and the United States at a juncture vital to the life of the new nation and enabled it to grow in strength, while the European antagonists fell against each other in a mighty non-American war.

Consult Bemis, Samuel Flagg, *Jay's Treaty; a Study in Commerce and Diplomacy* (New York 1923); Burt, Alfred L., *The United States, Great Britain and North America, from the Revolution to the Establishment of Peace after the War of 1812* (New Haven 1940).

SAMUEL FLAGG BEMIS,
*Sterling Professor of Diplomatic History and
Inter-American Relations, Yale University.*

JAZZ, *jāz*, an omnibus term for various 20th century styles of popular music historically and commercially linked with social dancing. When lumped together and regarded nontechnically, these styles are characterized by melodies shaped to standard lengths, syncopated and often complex rhythms, eclectic harmony and instrumentation, and standards of execution that range from inept formula to inventive virtuosity. As viewed by the devotee, jazz is a unique Afro-American music whose freshness and expressiveness are indebted to a free use of the human voice and the fullest possible exploitation of instrumental resources, plus an emphasis upon improvisation. Jazz, to the historian, is a musical compound whose initial synthesis is considered to have taken place under Negro and/or white auspices in the United States during World War I or thereabouts, but whose constituent elements can be traced to the Negro and Creole music of New Orleans as far back as the turn of the century and beyond to ever more remote and speculative origins in Latin America, Europe, and West Africa.

For the initiated, jazz cannot be wholly transferred to music paper. The true idiom is more a matter of how the material is rendered than what it may superficially look like, whether march, stomp, blues, popular song, or, if translatable into the jazz manner, an importation from the classical repertory. Good jazz musicians share a highly developed rhythmic sense anchored to the fundamental beat, considerable powers of improvisation, ample technique, and a group spirit marked by freedom and spontaneity, together with as relaxed an approach as is consistent with energized, intuitive, and hair-trigger responsiveness. It is, therefore, performance, as distinguished from composition or even elaborate arrangement, that often creates, upon the spot, the real jazz.

Etymology.—The etymology of the word is uncertain at best, yet what may well have been

the original climate of jazz music is suggested by such a proposed source as the French verb, *jaser*, which literally means to chat, to chatter, and presumably, by extension, to gossip (in tones). Early spellings in actual use were *jas*, *jass*, and *jaz*. Lafcadio Hearn reported that he encountered one form or another of the term in the Creole patois of New Orleans as far back as 1880. He said that the Louisiana Creoles had it from the Negroes and that it meant "to speed things up" as applied to music of a syncopated nature. Less polite meanings also have been suggested.

Ragtime.—One of the two immediate ancestors of jazz was ragtime, which, in turn, drew upon the march and such minstrel show sources as the buck and wing, cakewalk, and jig. The majority of rags had no text and were more instrumental than vocal in character. The basic rhythmic patterns of ragtime were Negroid and may be divided into two principal types known as primary and secondary rag. A common type of primary rag places a short note in what is normally a position of stress in the measure, a longer note in what is normally an unstressed position. This is a typical device of syncopation, which is essentially a deliberate shifting or displacement of normal metrical accent. Primary rag likewise suppresses accents proper to the established rhythmic pulse and by various means anticipates and postpones them. Secondary rag goes farther, in that it creates two independent rhythm patterns, whereby the melody may be in triple time, while the accompaniment remains in double time. Extended over several measures, secondary rag is often considered to exceed the limits of simple syncopation and becomes what is termed polyrhythm. (Consult Winthrop Sargeant's *Jazz: Hot and Hybrid* for a detailed analysis of jazz polyrhythm.)

Blues.—The second immediate ancestor of jazz was the blues, a type of vocal music now thought to have been developed by the southern Negro from the "cry" and "holler" in the first instance, with later influences from the work song (ensemble) and the spiritual (harmony). The blues took its character not only from a predominantly melancholy emotional content but also from the so-called blue (slightly flatted) notes characteristic of its melodies when sung by ear. These flatted notes, falling particularly on the third and seventh degrees of the scale, gave an unstable intonation to the normally major or minor pitch of these intervals. Unlike ragtime, the blues usually had a text, the bittersweet nature of which dictated a more or less declamatory style of rendering, less staccato rhythm, and a tempo frequently slower (New Orleans and St. Louis blues) than that of ragtime. The blues also made use of barbershop harmonies (highly chromatic chordal progressions) and an additional feature that later became prominent in jazz—the break. The break is a brief, improvised instrumental cadenza containing much syncopation.

Jazz emerged as a synthesis of certain elements of ragtime and the blues. It retained ragtime's rhythmic patterns, particularly secondary rag, while from the blues it acquired melodic resources (particularly "blue" tonality) which were wanting in ragtime. From the blues jazz likewise assimilated the expressive possibilities of a moderate tempo (slow blues) and the potential for freedom and variety afforded by the break.

Hot Jazz.—Early jazz tended to be "hot"

jazz, a relatively unrestrained, largely improvised style (except for basic chordal progression) which, although based upon popular tunes, was played with little or no dependence upon written parts. An early jazz band, which might consist of cornet or trumpet, trombone, clarinet, guitar or banjo, tuba or string bass, piano (if not a wagon band), and drums, would select a tune, perhaps announce it once in order to establish a point of departure, and then proceed to develop it freely under the inspiration of the moment. The development was of at least two kinds: a free-for-all in which each instrument went its own way in melodic and rhythmic competition with the others (New Orleans style); a take-your-turn scheme by which most of the instruments took solos in rotation, the others supplying a supportive background for them (Chicago style).

Sweet Jazz.—A more or less commercialized reaction to "hot" jazz started with the appearance of "sweet" jazz. This type sacrificed spontaneity and power and individual freedom in favor of milder, more conventional appeals. Where the "hot" band played without written parts, the "sweet" band often employed a full score, the players adhering to their parts as written. Suavity, close coordination, and considerable prettiness resulted. The "sweet" band also introduced a number of mild instruments, such as the harp, chimes, and celeste, meanwhile sharing with "hot" bands the violin (quite often to be found in pioneering, "hot" aggregations) and the subsequently adopted saxophone. Certain "sweet" bands, although maintaining among their personnel a nucleus of "hot" players, were ultimately expanded to a point where they approached the small symphony orchestra in numbers and pre-calculated discipline ("symphonic" jazz).

"Sweet" jazz meanwhile adopted the portamento style characteristic of spontaneous vocal blues and exaggerated it into the well-nigh perpetually sliding manner of the early crooner. "Sweet" jazz likewise reached out to various non-Negroid features of contemporary music: for example, melodic material of the sentimental ballad or Viennese light opera species and harmonic devices adapted from 19th century romanticism and 20th century impressionism. The essential jazz idiom was thus carried so far afield that it threatened to remain jazz only by virtue of the fact that it preserved the duple time (4/4) of the fox trot which, during World War I, superseded the one-step and the two-step. At no time, however, did the jazz tradition, even at its widest and loosest, embrace the triple time (3/4) of the waltz, although it did assimilate, during their periods of popular favor, such Afro-American dances as the shimmy and Charleston, such Latin-American dances as the tango, rumba, conga, samba, and mambo.

Swing and Boogiewoogie.—Jazz was refreshed in the mid-1930's by the rise of swing. While none too precise a term, swing may be described as a renaissance of "hot" jazz plus an added measure of premeditation, virtuosity, and, in some instances, slickness. A byproduct of this return to the past was boogiewoogie, heard at private gatherings (Negro) more than a decade prior to its public appearance about 1935-1936. Boogiewoogie is a type of piano blues that consists of a fixed, eight-beat, rhythmic figure for the left hand, above which the right hand improvises freely.

Bebop and Cool Jazz.—The 1940's witnessed the emergence of bebop or "bop," upon which several critics elected to look askance, finding it no more than overstrained "hot" jazz whose accompanying lyrics stressed the bawdy and the nonsensical. But other analysts arrived at far different conclusions, claiming to find in bebop a coolness, lightness, softness, and, despite its leaning toward the use of short phrases, a contrapuntal elaboration, which were a welcome change from what they regarded as the heat, weight, noise, and harmonic rigidity of crystallized swing.

"Cool" jazz, with its concern for a "lag-along" beat and pure instrumental tone and its reconsideration of the working relationship between naive heat and a restrained sophisticated intensity, came to prominence as a successor to bebop from about 1948 onward.

Rock 'n' Roll and Calypso.—A species of strongly rhythmic blues, developed at the outset by Negro musicians for the Negro market in the 1920's and revived in the 1940's, was eventually taken up by white bands, which modified it and popularized it during the mid-1950's under the name of rock 'n' roll. The same decade also proved hospitable to calypso, an importation from Trinidad. A hybrid form, it is said to have emerged under the influence of the West African song of ridicule. Its elements include melodic-harmonic borrowings from the French folk song, texts in a polyglot vocabulary, and African rhythmic infusions. American adaptations often feature lyrics that have lost their satirical bite and rhythms that have lost their indigenous interest.

History.—The history of ragtime is not too well documented, yet there are a few landmarks of tolerable accuracy. Making its appearance near the close of the 19th century with such an early example as *Harlem Rag* (1897) by the pianist Thomas M. Turpin and *Maple Leaf Rag* (1899) by W. Scott Joplin, ragtime was featured by the pioneering band of Buddy "King" Bolden at New Orleans from about 1895 onward, and by the pianist Ben R. Harney, who began a series of New York appearances at Tony Pastor's Variety Theatre in 1896. The first New York stage presentation of ragtime is said to have taken place at Proctor's Theatre in 1905, when Will Marion Cook's *Memphis Students* played a number of rags. *Alexander's Rag Time Band* by Irving Berlin, who did much to popularize ragtime, was published in 1911.

The recorded history of the blues is introduced by the now famous *Memphis Blues* composed by the cornetist and band leader, William Christopher Handy, and published in 1912, although written three years earlier. His equally well-known *St. Louis Blues* dates from 1914. At the outset intended to be sung, the blues had a great exponent in Bessie Smith and remained essentially vocal until the advent of exclusively instrumental blues, such as Edward "Duke" Ellington's *Blue Light*, and boogiewoogie (Jimmy Yancey, "Pine Top" Smith, Thomas "Fats" Waller).

Although the word jazz as applied to a species of popular music is considered to have entered the language (oral) circa 1914-1916 in Chicago, at least partial anticipations of the musical style thus labeled have been traced to examples that pre-date World War I. These anticipations of the "hot" jazz manner are

credited to such precursors as Freddie Keppard and the Original Creoles, reported by "Jelly Roll" Morton to have been playing powerful jazz in New Orleans well before 1914 (1908); Joseph "King" Oliver, cornetist, bandleader, and New Orleans contemporary of Keppard; and Ferdinand "Jelly Roll" Morton himself, composer of *King Porter Stomp* (1906), and arranger of *Tiger Rag*, based on a French quadrille and performed in various "hot" versions under various titles long before it was first recorded in 1917 as *Tiger Rag*. From about 1912 onward, jazz began to fan out from its reputedly original locus in New Orleans (Storyville). Not necessarily in strict chronological order (claims to priority remain in dispute), it is said to have been carried to Chicago by, among others, Tom Brown's Band from Dixieland; to New York by the same band and also by the Original Dixieland Jass (*sic*) Band; to Los Angeles (Keppard and the Original Creoles) and to San Francisco, where Art Hickman introduced a sweetened variety at the St. Francis Hotel as early as 1914.

"Sweet" jazz and "symphonic" jazz received stimulus from Paul Whiteman, who is credited with the first playing of jazz from fully scored parts at Los Angeles in 1920. Whiteman's pianist and arranger, Ferde Grofé, became widely known for his scoring of jazz music through which it reached semisymphonic proportions. Whiteman toured the United States and Europe, particularly during the 1920's, establishing landmarks by his jazz concerts, first in Aeolian Hall, then in the much larger Carnegie Hall, New York City. The Aeolian performance, which occurred on Feb. 12, 1924 and was attended by the first-string music critics of the metropolitan newspapers, purported to be the first jazz concert ever given. The program was highlighted by the debut performance of George Gershwin's *Rhapsody in Blue* (1924), an impressionistic work for piano and orchestra employing jazz elements.

Continuing his interest in jazz, Gershwin followed the *Rhapsody in Blue* with the *Concerto in F Major* (1926) for piano and orchestra; the tone poem *An American in Paris* (1928); *Second Rhapsody* (1932; originally *Rhapsody in Rivets*); a Negro folk opera, *Porgy and Bess* (1935), which was revived for a long run on Broadway in 1942; and *Jazz Piano Preludes* (1936), later scored for orchestra. By means of what was considered their freshness and originality, these works made Gershwin the first prominent example of simultaneous recognition in both tin-pan alley and the concert room.

Although preoccupation on the part of serious composers with jazz music and jazz performers may be said to have reached a peak in America and Europe about the mid-1920's, ragtime and jazz influences can be found in their output as far back as 1908, the publication year of *The Golliwog's Cake Walk* from *The Children's Hour* by Claude Debussy. Three additional early contributions were made by Igor Feodorovich Stravinsky with his *Ragtime* for 11 instruments (1918), *The Soldier's Tale* (1918) and *Piano Rag-Music* (1919).

Apart from Gershwin and by way of supplement to the above-mentioned contributions to at least nominal jazz music by Stravinsky and Debussy, the following representative list of European and United States composers and their compositions which employ ragtime and jazz

will serve to indicate the extent to which these musical forms invaded the art music of the 20th century.

John Alden Carpenter, *Concertino* (1915) for piano and orchestra, featuring ragtime; also his ballet *Krazy Kat* (1922), containing sections labeled "Fox-Trot" and "Blues"; likewise his ballet *Skyscrapers* (1926), using fox-trot rhythms and blues melodies.

Erik Satie, *Parade* (1917), a ballet written for the Russian impresario Sergei Diaghilev and carrying the subtitle *Rag-time du paquebot*.

Darius Milhaud, *Le boeuf sur le toit* (1919), ballet with jazz rhythms; and his *La création du monde* (1923), a ballet based on a scenario by Blaise Cendrars, treating the creation of the world, according to African Negro legends, and including a fugue on a jazz subject, a blues section, and an extended melodic passage with a barber-shop harmonic accompaniment.

Paul Hindemith, *Suite for Piano* (1922) with movements designated "Shimmy" and "Ragtime."

Louis Gruenberg, *The Daniel Jazz* (1924), scored for small ensemble and solo voice, text by the poet Vachel Lindsay.

Arthur Honegger, *Concertino* (1925) for piano and orchestra, with jazz rhythms.

Aaron Copland, *Concerto* (1926) for piano and orchestra, which employs Charleston rhythms and special jazz mutes for trombone.

Ernst Krenek, *Jonny spielt auf* (1927), an opera with a Negro bandleader as hero and, with sections marked "Shimmy," "Blues," and "Spiritual."

Maurice Ravel, *Sonata* (1927) for violin and piano, of which the second movement is a blues.

Constant Lambert, *Rio Grande* (1929), a composition for voices and orchestra, containing jazz rhythms.

Morton Gould, *Chorale and Fugue in Jazz* (1936).

Serious composers have been attracted to jazz by its rhythmic possibilities, by the uncommon tonal qualities to be had from special jazz handling of familiar instruments, and, above all, by the spirit of freedom and crisp candor rarely absent from genuine "hot" jazz and its performers. Composers have presumably been less interested in the emotional gamut of jazz, because it is thought to generate only a few fundamental moods—the melancholy protest or resignation of the blues, for example, and the headlong exhilaration of "jump." The commercial moonlight and roses of such songs as *My Blue Heaven* or *I'll Buy That Dream* stem from the sentimental ballad (as in songs by such composers as Jerome David Kern and Sigmund Romberg) rather than from jazz.

The interest of tin-pan alley commercialism in classical music has likewise been conspicuous and persistent. Early borrowings—such as a theme from Frédéric Chopin's *Fantasia-Impromptu* as the melodic basis of *I'm Always Chasing Rainbows*, and the considerable thematic assistance rendered to *Yes, We Have No Bananas* by the "Hallelujah Chorus" in George Frederic Handel's oratorio, *Messiah*—sired a numerous progeny. Various classics have from time to time been swung, prominent examples including a theme from a Mozart piano sonata which was turned into a fox trot and renamed *In An Eighteenth Century Drawing Room*; also Ignace Jan Paderewski's *Menuet à l'antique*; and Franz Liszt's *Liebestraum*. Other standard instrumental works have been treated more radically, emerging from the tune factory as popular songs. Among these may be cited the transformation of the opening theme of a Peter Ilich Tchaikovsky piano concerto into *Tonight We Love* and the yet more drastic metamorphosis of one of Chopin's polonaises into the sentimental ballad ("sweet" jazz type) *Till the End of Time*.

The evolution of more or less pure jazz, as distinguished from numerous hybrid forms, has acquired momentum from the playing and recordings of carefully selected, highly expert although

relatively large, combinations led by jazz musicians of the caliber of Louis "Satchmo" Armstrong, Fletcher Henderson, Edward "Duke" Ellington, Benny Goodman, William "Count" Basie, Gene Krupa, Woody Herman, Dizzy Gillespie, Stan Kenton, and Lennie Tristano—to name a representative few. Their leadership has proved significant, in that it has consistently affirmed the importance to any art of imagination, innovation, a high order of technical skill, and a following. The best jazz has also helped to keep alive the practice of improvisation, a musical capacity that had reached high levels by Ludwig van Beethoven's time (1770–1827), but suffered a decline in Western music thereafter, until a fresh impetus was supplied by that unassuming pioneer, the Negro folk musician.

That jazz will one day emerge as *the* American music remains a subject of perennial debate. Proponents urge its unremitting search for freshness, depth, and mastery. Opponents cannot forget its dubious origins, its uncommon susceptibility to box office, its comparatively narrow range of intellectual and emotional expression. Meanwhile, however, neither side denies to honest and gifted jazz music a continuing place alike among the enthusiasms of the specialist and in the favor of a large public.

MARKHAM HARRIS,
Associate Professor, Department of English,
University of Washington.

JEAFFRESON, jěf'ěr-s'n, **John Cordy**, English author: b. Framlingham, Suffolk, England, Jan. 14, 1831; d. London, Feb. 2, 1901. He was graduated from Oxford University in 1852 and then taught in private schools for six years. After 1858 he was a regular contributor to the *Athenaeum*. His first novel *Crewe Rise* (1854) was followed by a lengthy series in the three-volume type then popular, among them *Live it Down* (1863) and *Not Dead Yet* (1864), which were moderately successful. He was appointed inspector of documents for the Historical Manuscript Commission in 1874. He wrote five popular works of two volumes each, of anecdotal social history: *A Book about Doctors* (1860); *A Book about Lawyers* (1866); *A Book about the Clergy* (1870); *Brides and Bridals* (1872); *A Book about the Table* (1874). His duties as inspector of documents gave him access to manuscript collections which resulted in his publication of *The Real Lord Byron* (2 vols., 1883); *The Real Shelley* (2 vols., 1885); *Lady Hamilton and Lord Nelson* (2 vols., 1888); *The Queen of Naples and Lord Nelson* (2 vols., 1889; new ed., 1897).

JEALOUSY, jě'l'ūs-i, a complex and relatively enduring affective reaction, or emotional attitude, based upon a feeling of insecurity and

directed toward another person. Verbal reports by jealous adults usually mention the presence of anger, despair, and self-pity as the main components. The amount of jealousy may vary from a mild envy to obsessive thoughts of vengeance. A pervasive sense of inferiority and anxiety may lead one to become envious of the recognition and acceptance which others seem to receive from their associates. Hence, jealous feelings may arise and a state of melancholia ensue.

René Descartes (1596–1650), the French philosopher and scientist, regarded the state of jealousy as one of the six unlearned emotions. Contemporary psychologists regard it as a hybrid learned reaction which has its roots in the basal anxiety about being rejected, unloved, and unwanted. Those situations which excite the basal anxiety may be real or imaginary. The causes may exist only in the disordered fantasies of the jealous person. An unscrupulous person may suggest that there are causes for jealousy, as in the case of Iago, who implanted jealous thoughts in the mind of Othello in the Shakespearean play.

Jealousy has been reported in children as young as two years of age. The cause for such reactions is usually the arrival of a new brother or sister. Lack of thought about preparing the older child for acceptance of a new member of the family circle, favoritism, rejection of the older, or a lack of emotional security in the home are often mentioned as causes for what is termed sibling rivalry. Temper tantrums, regression in food habits and toilet functions, and excessive demands upon the parents may indicate that the older child is jealous. The treatment involves, in some instances, psychotherapy with the parents of the small child who is jealous.

PHILIP L. HARRIMAN,
Professor of Psychology, Bucknell University.

JEAN BAPTISTE DE LA SALLE, zhān bà-tēs't' dē là sāl', SAINT, French priest and educator: b. Reims, France, April 30, 1651; d. Saint-Yon near Rouen, April 7, 1719. He was tonsured at the age of 11 and was made a canon of Reims in 1667. He studied at the University of Reims (where he was later—in 1681—admitted to the doctorate in theology) and subsequently at the Sorbonne while residing at the Seminary of St. Sulpice in Paris. He received priest's orders in 1678. After his return to Reims he met in 1679 a layman, Adrien Nyel, who interested him in a project of schools for poor boys. La Salle's zeal for this work had so grown by 1681 that he invited the seven masters who taught them to live in his own house.

From this beginning gradually emerged the idea of a religious institute; and La Salle resigned his canonry (1683) and disposed of his property by giving it to the poor in order to devote himself entirely to education. Four schools were now being conducted by his men and, after a conference with 12 of them, it was decided in 1680 that they would band together as Brothers of the Christian Schools (q.v.). The first recruits had been full-grown men; but in 1685 it became necessary to organize a junior novitiate to accommodate boys between 15 and 20, who began to apply in large numbers. La Salle also established training schools for lay teachers (Reims, 1687; Paris, 1699; Saint-Denis, 1709).

A characteristic feature of La Salle's educational system was his insistence on the use of

the vernacular instead of Latin. He also brought into practice "simultaneous" or class, as opposed to individual, instruction; and he preferred the Socratic to the lecture method. After some initial opposition, his ideas gradually won the approval of the universities as well as of ecclesiastical and civil authority.

One of La Salle's most interesting foundations was that of the Écoles Dominicales in 1699 at Paris, where regular public courses in arts and sciences were given to all comers on Sundays. In 1688 he had assumed control of the parish school at St.-Sulpice in Paris, the last of the seven free schools founded by his famous predecessor, Père Jean Jacques Olier (1608–1657, q.v.). A second school was opened, and both were placed under Frère Henri L'Heureux, whom La Salle had selected as his successor and whom he was about to present for ordination. The unexpected death (1690) of this man seems to have given check to La Salle, causing him to establish the statute that none of his community could be a priest and that no priest could be received as a full member into the Institute of the Brothers of the Christian Schools. He thus assured the absence of any caste system in it.

La Salle opened a school in 1698 for 50 boys of gentle birth at the request of the exiled King James II of Great Britain. Frère Gabriel Drolin was sent in 1700 to found a school in Rome; and many others were established in France prior to La Salle's resignation as superior in 1717. Henceforth he lived in the Novitiate at Saint-Yon, where he taught and wrote, while following the routine imposed on the humblest of his brethren until his death.

La Salle was of striking and dignified appearance; well connected, refined, and scholarly. He was gentle and kind in his dealings with others. In his spiritual outlook and doctrine he was an exponent of the attractive humanistic spirituality of the French school headed by Pierre Cardinal de Bérulle (1575–1629) and Père Olier. His published writings are concerned with both educational and ascetical subjects. His works include *Les devoirs du chrétien* (1703) and *Conduite des écoles* (1717).

The constitutions of the institute which La Salle had drawn up about 1695 were finally approved in 1725 by Pope Benedict XIII. La Salle was canonized in 1900 by Pope Leo XIII. Pope Pius XII declared him the patron of all school-teachers in 1950. His institute has grown to be the largest teaching order in the Roman Catholic Church. His feast is on May 15.

ALASTAIR GUINAN.

JEAN CHRISTOPHE, zhān krēs-tôf', by Romain Rolland. One of the most noteworthy novels to appear in France from Émile Zola's death (1902) to the opening of World War I (1914) was the *Jean Christophe* of Romain Rolland. Its importance lies partly in the novelty of its informal manner and partly in the range and importance of its theme. With regard to manner, Rolland has discarded rhetoric and eloquence, climax, dramatic effect, and all the novelist's traditional methods to tell his story in the simple language of conversation and to follow in his meandering and now and then clogged and almost tedious

narrative, the slow moving processes of life. With regard to his theme, he had set himself the task of studying the unfolding of a musical genius, tracing him from infancy through childhood and adolescence in Germany, to full maturity in Paris, at a time of unsettled, shifting, and conflicting ideals. This gradual unfolding of the temperament of Jean Christophe provides the principle of unity which links the 10 small volumes of the French edition. But the analysis of Jean Christophe's psychology is but one element of interest; for the larger aspects of the theme imposed themselves upon the author as he proceeded and as he brings his hero into contact with the ruling classes in Germany, with new-found French friends and with the world of music and letters. His minute study of a single great man thus widens, until it becomes a dispassionate yet keen survey of the national ideals of leading European peoples in the somber twilight that marked the closing of the 19th century. Teacher and critic rather than great creative artist, Rolland had been moved to write the history of the inner life of the generation that came to maturity before World War I and to present its account to posterity.

The task was a large one and the results were uneven. The earlier volumes, especially the first, dealing with the childhood of Jean Christophe in the old-fashioned south German town, have the clearness, quaintness and charm of old engravings and are artistically the most perfect. As he proceeds and his subject broadens, the author loses himself in disquisitions on art and politics, but especially on music, which even when correct in substance are out of focus. The later volumes therefore give an impression of diffuseness and lack of artistic mastery and are marked by the touch of resentment of one who had struggled long and bitterly for recognition. No author of the time, however, had shown greater penetration, and the contrast between Teuton and Latin character and civilizations was clearly and truthfully drawn. Rolland knew the hidden springs from which France drew her strength and was conscious of the coming "revival" of the spirit of France. He foresaw also the rapidly approaching era of force and war, and his later volumes read like a prophecy of the coming cataclysm which he deplored. This is a testimony to the truth of his diagnosis. When, however, after the outbreak of the war he pleaded in *Above the Conflict*, as he had done in his novel, for mutual understanding, he was disowned by the generation which had earlier acclaimed him as its spokesman.

When all is said, in spite of the touches of sourness, of inconsistencies, tiresome disquisitions, and occasionally grotesque psychology, Rolland's scope and range, his earnestness, sincerity and vision mark his work as one of the truly important achievements in French prose fiction of the early 20th century.

CHRISTIAN GAUSS,

Late Dean of the College, Princeton University.

JEAN DE MEUNG, zhān' dě mūn' (real name JEAN or JEHAN CLOPINEL or CHOPINEL), French poet: b. Meung-sur-Loire, France, ?1240; d. ?1305. According to tradition, he studied at the University of Paris. His literary fame rests on his authorship of the greater part of the *Roman de la Rose* (q.v.), the most famous French poem of the 13th century, of which

Geoffrey Chaucer was to make good use in *The Canterbury Tales*. The first part of the *Roman* consisting of 4,669 lines was the work of Guillaume de Lorris who died some time before 1240. Internal evidence indicates that the additional 18,000 lines were composed by Jean de Meung some time between 1268 and 1285. It is by far the more important section of the poem. In theme and spirit the two authors are in striking contrast: de Lorris began the work as an allegory to teach the art of love to courtiers and their ladies; de Meung, with an immense scientific and literary learning, continued it as a satire on the social system of his day, his shafts striking all the vested interests with perfect impartiality. The poem entitles Jean de Meung to rank as the greatest of French medieval poets; its skeptical, mocking spirit is echoed down the centuries in the writings of prose writers as well as poets. Other works of de Meung include a translation of the *De re militari* of Vegetius, appearing as *Le Livre de Vegèce de l'art de chevalerie* (1284); the first French version of the letters of Abelard and Héloïse; a translation of Boethius' *De consolatione philosophiae*. Toward the end of his life appeared his *Testament* in which, while praising sincere piety, he poured his scorn on the monastic orders.

Consult: Paris, Paulin, "Jean de Meung," vol. 28 in *Histoire littéraire de la France* (Paris 1840); Langlois, C. V., introduction to his 1914 ed. of *Roman de la Rose*.

JEAN PAUL. See RICHTER, JEAN PAUL FRIEDRICH.

JEANERETTE, jĕn-ĕr-ĕt', town, Louisiana, in Iberia Parish, 32 miles east of Lafayette, situated on the Bayou Teche, and served by the Missouri Pacific and Southern Pacific railroads and state highways. Located in a rich agricultural section producing pecans, rice, and sugar cane, it has six sugar refineries, a cane cutter factory, and a boiler works. Other manufactures include agricultural machinery, boats, wood and machine shop products, and mattresses. The town has a library and a municipal airport. Nearby is a federal livestock experimental station. Pop. 5,568.

JEANES, jĕnz, **Anna T.**, American Quaker philanthropist: b. Philadelphia, April 7, 1822; d. Germantown, Pa., Sept. 24, 1907. She was deeply interested in charitable and educational institutions and gave freely to their support, as well as to projects for the elevation of the Negro race in the United States. By her will she disposed of her estate, worth over \$5,000,000, among 30 charitable institutions, also giving \$200,000 to the Friends Boarding Home, Germantown, Pa., to which she retired in her last years. She also gave \$1,000,000 as a "Fund for Rudimentary Schools for Southern Negroes," known as the Anna T. Jeanes Foundation (q.v.).

JEANES (Anna T.) FOUNDATION, a fund of \$1,000,000 placed under the trusteeship of Booker T. Washington and Hollis B. Friswell, April 1907, by Anna T. Jeanes, for the purpose of "assisting in the southern United States community, country and rural schools for the great class of Negroes to whom the small rural and community schools are alone available." The work of the foundation is closely allied with that of the General Edu-

cation Board. It concerns itself chiefly with industrial education, extension work, and the improvement of educational and home conditions.

JEANNE D'ARC. See JOAN OF ARC.

JEANNETTE, jě-nět', city, Pennsylvania, in Westmoreland County, located 22 miles east-southeast of Pittsburgh. Jeannette is in an agricultural and coal mining region, and has plentiful natural gas. The city has several industries. Manufactures include window glass and pressed glassware of many varieties, rubber tires and tubes, turbines, condensers, and electrical equipment. Settled in 1888 and incorporated in 1889, Jeannette is called the "Glass City" from having grown up around glass works founded in 1889 by a group including H. Sellers McKee, for whose wife it was named. Pop. 16,565.

JEANNETTE EXPEDITION, an enterprise projected in 1879 by James Gordon Bennett, Jr., of the New York *Herald*, who sent out an Arctic expedition for exploration by way of the Bering Strait in the *Jeannette*, under the command of George Washington De Long, United States Navy. Sailing from San Francisco, Calif., the *Jeannette* was early caught in the ice pack, drifted for nearly two years, and never escaped from its grip. After the *Jeannette* sank on June 13, 1881, the crew attempted to reach Siberia in three open boats. One boat disappeared, and that of chief engineer George Wallace Melville reached an eastern mouth of the River Lena; De Long, with 14 companions, reached the main mouth of the Lena but died shortly afterward from exposure. Melville recovered his body and brought it to New York City, which he reached in May 1882. In June 1938 a Russian party found De Long's indecipherable diary in an improperly sealed copper cylinder on Henrietta Island, which the explorer had named.

Consult Ellsberg, E., *Hell on Ice* (New York 1938); De Long, E. W., *Explorer's Wife* (New York 1939).

JEANS, SIR James Hopwood, English physicist, astronomer, and author: b. London, Sept. 11, 1877; d. Dorking, Surrey, Sept. 16, 1946. He graduated at Trinity College, Cambridge University, with high distinction in mathematics in 1898, and in 1904 was appointed university lecturer in mathematics. From 1905 to 1909 he was professor of applied mathematics at Princeton University, and during 1910-1912 he was Stokes lecturer in applied mathematics at Cambridge. In 1919 he was appointed secretary of the Royal Society, a post he continued to occupy until 1929; he was also professor of astronomy in the Royal Institution during 1924-1929, and again from 1934. From 1923 to 1944 he was research associate of Mount Wilson Observatory, in California. As a physicist, he devoted much attention to the kinetic theory of gases and aspects of radiation; and as an astronomer, he was concerned with mathematical analysis of problems in the field of cosmogony. He propounded theories of the effect of gravitational attraction on stellar motions, and of the nature and formation of binary stars, spiral nebulae, giant and dwarf stars, and gaseous stars. His numerous works, some of them popularizing science, included *A Dynamical Theory of Gases*

(1904); *Theoretical Mechanics* (1906); *The Mathematical Theory of Electricity and Magnetism* (1908); *Radiation and the Quantum-Theory* (1914); *Problems of Cosmogony and Stellar Dynamics* (1919); *Atomicity and Quanta* (1926); *Astronomy and Cosmogony* (1928); *The Universe Around Us* (1929); *The Mysterious Universe* (1930); *The Stars in Their Courses* (1931); *Through Space and Time* (1934); *Science and Music* (1937); *An Introduction to the Kinetic Theory of Gases* (1940); *Physics and Philosophy* (1942).

JEBB, (Hubert Miles) Gladwyn (BARON GLADWYN OF BRAMFIELD), British diplomat: b. Rotherham, Yorkshire, England, April 25, 1900. He studied at Magdalen College, Oxford, and graduated with honors in 1922. Entering the diplomatic service, he served in Teheran (Tehran) and Rome, and at the Foreign Office in London. During the early years of World War II he was attached to the Ministry of Economic Warfare, and in 1942 he returned to the Foreign Office to head its reconstruction department, concerned with postwar problems. In March 1943 he visited Washington, D.C., in company with Foreign Secretary Anthony Eden to discuss prospects for a United Nations organization, and he subsequently went to the Dumbarton Oaks Conference, in Washington, and to the conference at Yalta where President Franklin D. Roosevelt and Winston Churchill met with Marshal Stalin. He was a leading British delegate to the San Francisco Conference in the spring of 1945 when the United Nations Charter was signed, and in August of that year he became executive secretary of the United Nations Preparatory Commission—which worked out detailed plans for the organization. In 1946 he deputized for Foreign Secretary Ernest Bevin at the Paris Conference which evolved the Italian peace treaty, and in 1948, with the personal rank of ambassador, he was British representative on the Brussels Treaty Permanent Commission. Knighted in 1949, he was Britain's permanent representative at the United Nations (1950-1954) and ambassador to France thereafter until 1960, when he was elevated to the peerage.

JEBB, SIR Richard Claverhouse, Scottish Greek scholar: b. Dundee, Aug. 27, 1841; d. Cambridge, Dec. 9, 1905. He was educated at the Charterhouse, London, and at Trinity College, Cambridge University. From 1875 until 1889 he was professor of Greek at the University of Glasgow, and thereafter he occupied a like chair at Cambridge until his death. From 1891 he was also member of Parliament for Cambridge University. In 1874 he married the widow of Gen. Adam J. Slemmer, American army officer, and he paid several visits to the United States. He published translations, with notes, of several of the Greek writers; his greatest work was his edition of Sophocles, which was regarded as the most completely satisfactory commentary on a classical author that had been written in the English language. He was knighted in 1900, and received the Order of Merit in 1905.

JEDBURGH, jěd'bŭ-rŭ, burgh, Scotland, county town of Roxburgh, located on the Jed, a tributary of the Teviot, 56 miles southeast of Edinburgh. Here is a stately ruined abbey founded as a priory for the Augustinian monks in 1118 or 1138 and erected into an abbey by David I in 1147. The

castle, erected by David I and occupied by William the Lion and other Scottish kings, was leveled by the townspeople in 1409 because its frequent capture by the English in border fighting menaced their security. The site was occupied by a prison in 1823, but the building fell into disuse and came to be called "the castle." There remain houses occupied by Mary Queen of Scots in 1566 and by Prince Charles Edward in 1745. The poet James Thomson was educated at a grammar school here, and the town also has associations with Robert Burns and William Wordsworth. In 1955 its principal industries were woolen milling, leather tanning, and the manufacture of artificial silks. Pop. (1961) 3,647.

JEDDAH. See JIDDA.

JEEJEEBHOY, jē-jē-bā'ē, **SIR Jamsetjee**, Indian merchant and philanthropist: b. Bombay, India, July 15, 1783; d. there, April 14, 1859. The son of poor parents, he amassed a fortune of £2,000,000 in the China trade and in other ventures, becoming the foremost merchant in India. He gave away much of his wealth for charitable purposes. In 1822 he secured the release of all persons imprisoned for debt in Bombay, by meeting the claims against them. He also gave large sums for the relief of victims of disastrous fires at Surat in 1824 and 1837; provided funds for the performance of Parsi religious rites; endowed a hospital in Bombay in 1843 and schools in several Indian cities; and financed the construction of valuable public works. He was knighted on May 2, 1842, and was created a baronet of the United Kingdom on Aug. 6, 1857.

JEFFERIES, jěf'riz, **Richard**, English naturalist and author: b. near Swindon, England, Nov. 6, 1848; d. Goring, Aug. 14, 1887. The son of a farmer, he was self-educated except for some years of elementary schooling. At 16 he ran away from home with a friend to go to Russia or America, but was compelled to return by lack of funds. His talents were noticed by the publishers of local newspapers, and he was employed to write descriptive articles and news reports. Meanwhile he began work on several novels and plays, but his first efforts were failures. After 1872, however, he became a regular contributor to leading English magazines. His series of articles "The Gamekeeper at Home," reprinted in 1877 from the *Pall Mall Gazette*,

established him in popular favor; but his health, always precarious, broke in 1881. He continued working as long as he was able and became celebrated for his prose style, acute observation of rural life, and purity of feeling.

Jefferies' late works include several collections of sketches, notably *Wild Life in a Southern County* (1879), *The Life of the Fields* (1884), and *Red Deer* (1884); and several novels, including *Wood Magic* (1881), *Bevis* (1882), *After London* (1885), and *Amaryllis at the Fair* (1887). He was also the author of an autobiography, *The Story of My Heart* (1883).

Consult Arkell, Reginald, *Richard Jefferies and his Countryside* (London 1947).

JEFFERS, jěf'ērz, (**John**) **Robinson**, American poet: b. Pittsburgh, Pa., Jan. 10, 1887; d. Carmel, Calif., Jan. 20, 1962. He graduated from Occidental College in 1905 and was subsequently a student of medicine, forestry, and other subjects at the University of Washington, the University of Southern California, and the University of Zürich, Switzerland. After 1913 he resided in Carmel, Calif., and the adjacent country became the habitual setting of his poems. His principal themes are the grandeur and beauty of nature, the comparative insignificance and worthlessness of modern man, and the consequent good to be found even in negative or destructive forces, such as war. His first volume of poems, *Flagons and Apples* (1912), is considered uncharacteristic. His later works, including several long narrative poems, frequently make use of materials drawn from ancient Greek culture, and are filled with incidents of violence and sexual perversion, symbolic of larger social or cosmic events. Considered characteristic of Jeffers' mature work are *Tamar and Other Poems* (1924); *Roan Stallion* (1925), an allegorical narrative in free verse included in a new edition of the previously named volume; *The Women at Point Sur* (1927), a free verse narrative; *Cawdor and Other Poems* (1928); *Dear Judas and Other Poems* (1929); *Descent to the Dead* (1931); *Thurso's Landing and Other Poems* (1932); *Give Your Heart to the Hawks* (1933); *Solstice and Other Poems* (1935); *The Double Axe* (1948). His free translation of *Medea*, by Euripides, was produced on Broadway in 1947 and later on television.
